The debates began briskly with an attack on the council's majority decision to withdraw from the Association Professionelle Internationale des Médecins (A P I M) Defending this decision Sir KAYE LE FLEMING (chairman of council) said he had always been very keen on international medical coöperation, but was not convinced that the A P I M has served any useful purpose or is likely to do so The attendance at its meetings was very small, they were too widely spaced for any considered policy to develop, and delegates must speak French As a means of enabling representatives of voluntary bodies to discuss medical problems the A.P I M was a failure It had never discussed the disasters that have overcome sections of the profession abroad Lately the election of a Czech as president, and the choice of Prague as meeting place, had had to be quashed because a member from a totalitarian state said that otherwise his government would not let him attend Mr R SCOTT STEVENSON, leading the opposition for Marylebone, asked whether this country is going to abandon all international conferences because they are conducted in French The A P I M was not the only body that is sparsely attended or has abandoned Czechoslovakia Other representatives said that the B M A must not withdraw from an organisation which it helped to bring to birth, that it must not foster the narrow nationalism now trumpling, and that it should lead rather than run away—improve the A P I M and not desert it Dr PETER MACDONALD (deputy chairman of the representative body) thought this the worst possible time at which to extinguish one of the last flickering flames of coöperation with other countries, and Mr MCADAM ECCLES believed withdrawal from the A P I M would be a blow to the international medical societies of specialists Mr V ZACHARY COPE said that anything that enables people of different nations to compare notes is good, that the B M A, with its expanding influence, should be in contact with Europe as well as the Empire, and that it would be disastrous to dissociate British doctors from colleagues on the Continent at this particular juncture "If there is ever a time when professional people all over the world should keep together and give a lead this is it," said Dr C F T SCOTT The practical merits of the A P I M as a bond were seriously questioned by one or two speakers, but the meeting accepted the Marylebone view that the B M A should remain a constituent member of it

Refugee Doctors

Dr ERNEST WARD for Torquay, criticised the council because, *without consulting* the representative body, it told the Home Secretary that the association had no objection to the admission of a further 50 refugee practitioners This led Sir KAYE LE FLEMING to explain the steps taken Before the B M A was consulted some 200 doctors came into this country to practise The council then protested and the Home Office agreed to consult it about the numbers henceforth permitted entry and the persons to be chosen When accepted the foreign doctor must study medicine here for two years before registration, and for seven years afterwards he would remain under supervision by the Home Office, which could decide where he is to work On these terms the B M A consented to the admission of 50 Austrians The further decision to take 50 Czechs had to be made at short notice, even before the council assembled, "and I would be ashamed," said Sir Kaye, "to meet this body and say we were not prepared to do for Czechoslovakian doctors what we have done for Austrian doctors" On hearing which, Torquay withdrew its objection

Dr J MELVIN, for Wandsworth, proposed a counter-blast to the Trades Union Congress's light hearted demand for the admission of more foreign practitioners let the association agree to take one medical refugee for every thousand absorbed by other trades and callings But Dr A A LEWIS, speaking for Kensington, thought the protest undignified, and it went no further

Asked to disclose how many refugees have been admitted to the Medical Register during the past twelve months Sir KAYE LE FLEMING said that in 1938 the number was 103, of whom 35 have joined the association It was impossible to dissect the total so as to show the various grounds on which they secured registration

Preparations for Emergency

Sir KAYE LE FLEMING recalled that by last autumn the emergency register of practitioners contained the names of 90 per cent of the profession, with their qualifications and offers of service "we knew all about them" But it was then realised that the information cannot be used effectively unless all applications for doctors come through a single channel The present arrangement was that the Ministry of Health shall coördinate all requests from the services for medical personnel, and that military needs shall be met through the central medical emergency committee, which has been made fully representative of the profession Demands for doctors to care for the civil population must all go to the local emergency committee of the area, and allocations would be made locally subject to the consent of the central committee It had long been impossible to get an answer from the authorities about the status of doctors allocated to civilian hospitals, but the Government had now agreed to a scale of remuneration for the national hospital service, comparable to remuneration in the army Those provisionally appointed to it must say they will serve for three years

Brighton proposed that the cost of all this work by the central and local committees should be borne by the Government and Prof R M F PICKEN also thought this fair, except in so far as the work is concerned with the protection of practices Sir KAYE LE FLEMING said that in the early stages the association asked for no money, but the maintenance of the register had been very expensive and the six clerks now employed were paid by the Government On the other hand he was strongly against asking the Exchequer to find all the necessary funds The work represented a contribution to the public welfare by the B M A, which had gained a priceless privilege in ensuring that the profession will manage its own

affairs in time of emergency. More help might be asked; but "let us keep the control of this machinery in our association, and be proud of it" Here Mr. H J McCURRICH pointed out that though aid is being given at the centre none is available at the periphery, and the local committees can ill bear the expense. Incidentally, said Brighton, the money is being spent partly for the benefit of doctors outside the association.

Dr. MELVIN said it was laid down that no-one under 35 should be earmarked for A.R.P. work; the younger men were expected to enter the Services. What was now happening, however, was that young men were being refused hospital posts because they *are* in the Services. The hospitals did not want to employ men who would at once be called away. He suggested, for Wandsworth, that "no candidate for appointment to the position of house-physician, house-surgeon, registrar, or member of the honorary staff of any hospital shall be asked to state whether he is or is not a member of the Territorial Army or other auxiliary forces of the Crown."

Mr. McCURRICH asked how hospitals in reception areas are to be carried on if they are filled with refugees and the majority of the staff are removed. Nobody wished to penalise anyone joining the Territorials, but how was the work of hospitals to be done if men were appointed to them who would leave at the beginning of an emergency? Dr. LEWIS replied that posts should be filled according to the ability of the candidate and nothing else. Mr. McCurrich's hospital should not punish applicants because of a possible war; it should have a shadow scheme that would work without them. Dr. E. R. C WALKER thought it impossible to prevent prospective employers asking about the military obligations of employees; but it might be laid down that such obligations should not stand in the way of their appointment.—The suggestion was referred to council.

Dr. C M. STEVENSON said that his "safe" area, with a population of 100,000 or so, had been told that it would receive 25,000 children, 1000 blind, and 300 women on the point of confinement. Many of the local doctors would have been called up and "we want to know what we're to do about it." Sir KAYE LE FLEMING told him that the Government has accepted responsibility for payment for the medical care of the officially evacuated. He also assured Torquay that in war-time steps would be taken to supply practitioners with petrol.

The meeting unanimously approved a motion by Dr. GLADYS BOYD, for Edinburgh, that medical officers should be attached to the Women's Auxiliary Services, that these medical officers should be women, and that they should examine recruits.

Afterwards

Schemes are being devised to ensure that practitioners undertaking service shall find their livelihood preserved on returning after a war. Dr. WARD said that in time of war all practice in London and some of the large towns might cease, whereas there would be an increase in reception areas. His division, Torquay, thought the proposed plans for filling in cards to be forwarded once a month to a classifying bureau would break down It might be preferable for the practitioner treating the case to give half the fee to the patient's own doctor. To this belated criticism Sir KAYE LE FLEMING wrathfully replied that the card system had been approved after consultation with areas where schemes were worked successfully during the late war, and was now ready for operation in four-fifths of the country.

The council has recommended that when a practitioner is called up in *peace-time* under the Auxiliary and Reserve Forces Act the names of his insured patients attended in his absence by another practitioner shall be restored automatically to his list "except in the case of those insured persons who express a wish to the contrary." Dr J. B. S GUY wanted this exception removed, since patients might get used to their temporary doctors and the absentee might suffer great loss of practice. Mr. A. HEDLEY WHYTE thought the words positively give a lead to patients to stay with their new doctor. Sir KAYE LE FLEMING, commenting on the plan that patients should be compelled to return to the absentee practitioner's list for a year, remarked that the B.M.A. holds by free choice of doctor. Under existing law the term of peace-time service was limited to three months.

Dr. DOROTHY MASON, for St. Pancras, wished to see provision made for pensions for doctors disabled on A.R.P. work, or for their dependants. In recent A.R P. exercises Dr. J. W. WIGG had been impressed by the danger of medical work in air-raids. The general public could stay in dug-outs; but not the doctor. Service officers worked with more enthusiasm, he thought, for the knowledge that their widows will be provided for. Sir KAYE LE FLEMING sympathised with this view; but what about the nurse and the A.R P. warden? Doctors could not claim special privileges and the Government regarded the problem as too complex to tackle at present. The central emergency committee would nevertheless keep it before the authorities

Tunbridge Wells, represented by Dr A. M. POLLOCK, hoped that the Government will protect the financial interests of medical men on national service, as it has been protecting those of the militia—e.g., as regards suspension of interest on loans and mortgages—and that it will also provide a gratuity at the end of the war to compensate them for loss in the capital value of their practices To Sir KAYE LE FLEMING this sounded unduly acquisitive. Those who claim the privileges of independent practice could not also claim the privileges of the whole-time Government servant. A practical method of protecting practices had been organised, and with goodwill it would work. If a doctor's colleagues could not do him justice, was it likely that M.P.s would do so? And "Heaven help the man who thinks the Government will introduce legislation for this purpose!"

A request has already been circulated that no permanent appointments shall be made in war-time to the medical staffs of Government departments, local authorities, or voluntary hospitals. Portsmouth wanted to go further and say that "if, owing to nationality or any other reason, a doctor has not undertaken or has refused to undertake national service he shall not be eligible for any such permanent appointment after the emergency" This motion was lost, however; for, said Sir KAYE LE FLEMING, this is a free country, and "what restrictions can we provide to prevent such a thing happening?" If all appointments went through the local emergency committee they would have a good chance of objecting.

Hospital Contributory Schemes

The revised hospital policy of the B.M.A. sets out a scale of incomes above which (it is suggested) no-one should be allowed to join a hospital contributory scheme or receive free treatment at hos-

pital from the visiting staff The upper limits of income are as follows —

1 Single persons over 16 or widows or widowers without children under 16 £200 a year, or £4 a week.

2 Married couples without children under 16, and persons with one dependant under 16 £250 a year, or £5 a week

3 Married couples with a child or children under 16, and persons with more than one dependant under 16 £300 a year, or £6 a week

These limits, it is stated are applicable to London, elsewhere they would need to be lower, according to the local circumstances

East Yorkshire and Exeter proposed that each of these income limits should be reduced by £50—to £150, £200, and £250—with scope for periodical revision. The higher scale, said Mr RITCHIE RODGER, were a very bad bargaining instrument, they put the onus on the profession to prove that they are too high for a particular area, whereas the onus ought to be on the other side The income limits were personal limits, and four figure families could slip through the net moreover no account might be taken of subsidiary sources of income Everyone admitted that a man with £300 a year might find it hard to produce £40–£50 for an operation, but there were now provident schemes to aid him Dr F GRAY said that the contributory schemes were on trial, and it was always unwise to state maximum terms at the outset Dr H S HOWIE WOOD remarked that it is not until a contributory scheme has been in action for some time that one discovers the damage it does to private practice Dr A BEAUCHAMP, on the other hand, thought that if the level is reduced too low it would be very bad for the contributory associations which collected money for hospitals and did not all guarantee treatment Did the B M A want to put another nail in the coffin of the voluntary hospitals? Dr PETER MACDONALD (chairman of the hospitals committee) said that if the association put forward too low a figure it would antagonise the hospitals They were already conceding professional claims, for instance, the British Hospitals Contributory Schemes Association had agreed that services conveniently obtainable from private practitioners should not be given at hospital Mr RITCHIE RODGER, who sees the poor being squeezed out of hospitals by people with £300 a year, again urged the damaging effect of contributory schemes on general and consultant practice, but he failed to persuade the meeting to make his desired reduction of £50 in the scales submitted

The next part of the draft hospital policy to come under fire was the following paragraph —

"It is undesirable that private patients should be seen or treated at the outpatient department of a hospital unless such an arrangement is necessary in the interests of the patient It is recognised that certain forms of treatment involve the use of costly apparatus most readily available at hospitals, and that team work, so often essential, can be organised more easily at hospital Where the treatment of private patients is in fact arranged at out patient departments the following conditions should apply "

Dr S WAND saw in this an insidious approach to toleration for the practice of medicine in hospitals Exceptions were necessary, for example, deep X ray therapy must be given in a suitable department, and there are places where a visiting specialist has no facilities for working except at a hospital But the above paragraph left the door wide open to abuse What was meant by the "interests" of the patient, by "most readily available" or by "can be organised more easily" or "team work"? He saw a time coming when patients would be shepherded by contributory schemes to the outpatient departments, there to be seen by consultants whose fees would be assessed by the hospitals and contributory associations, he saw a time when consulting practice would be possible only under the control of hospitals, and only by those they see fit to appoint

Dr MACDONALD, in reply, accepted the words "in the *medical* interests of the patient", but opposed Dr Wand's proposed omission of the whole of the next sentence More and more private work, he said, is going to be done at hospitals, and the sooner we recognise this the better for the patient, the better for the hospitals, and in the long run the better for the consultants "Aha," replied Dr WAND, "Dr Macdonald has at last given himself away" There were two schools of thought about the desirability of private work being done at hospitals and the meeting must decide—It decided in his favour, omitting the words from "It is recognised" down to "more easily at hospitals" It also added, on his proposal, a statement that "at the earliest possible moment the results of the investigations and suggested treatment should be communicated to the practitioner, to whom the patient should be returned for treatment as soon as practicable"

Brighton then produced the case of the member of a contributory scheme whose income, though £300 a year or less, is derived partly or wholly from investments Money spent on the maintenance of health, said Dr A W GARDNER, should be treated as capital expenditure The small capitalist should be debarred from a contributory scheme, for an income of £250 at 3½ per cent represented £7100, and even if the patient had to sell £100 of shares to pay his fees he would still have £7000 and lose only 1*s* 2*d* a week of his income The non admission of such people had been dismissed last year as impracticable, but it was in operation at Plymouth Consultants said Mr MCCURRICH, will gladly give gratuitous service to the necessitous poor, but are people with £7000 necessitous poor? Dr S NOY SCOTT testified to the successful work of an "eligibility" committee at Plymouth since 1932 Dr MACDONALD maintained that the very few people affected could not be controlled, and that contributory schemes would refuse to make inquisitions into their members' source of income Dr LEWIS thought it inequitable to ask a man to give up 1*s* 2*d* a week for the rest of his life, since one would never ask a workman to surrender permanently part of his wages The meeting, however, agreed with Dr GARDNER that this would not be a terrific burden for the sake of health, and the Brighton resolution was carried

Monopoly of Pay-beds by Consultants

Dr R BOYD asked the representative body to view with concern the method by which auxiliary hospitals, and nursing homes connected with hospitals, are being monopolised by specialists and consultants on the staff of hospitals, to the exclusion of general practitioners The opening of homes attached to hospitals, he said, meant the closing of the private nursing homes to which practitioners have sent their patients and consultants were taking over practitioners' work The London provident scheme offered payment to patients for nursing home care—but only if they were under the care of a consultant

Mr ZACHARY COPE said it was only right that consultants giving two thirds or more of their time to gratuitous work at a hospital should have a prior claim to the use of pay beds attached to it But the

affairs in time of emergency. More help might be asked, but "let us keep the control of this machinery in our association, and be proud of it" Here Mr. H. J. McCURRICH pointed out that though aid is being given at the centre none is available at the periphery, and the local committees can ill bear the expense. Incidentally, said Brighton, the money is being spent partly for the benefit of doctors outside the association.

Dr. MELVIN said it was laid down that no-one under 35 should be earmarked for A.R.P. work; the younger men were expected to enter the Services. What was now happening, however, was that young men were being refused hospital posts because they *are* in the Services. The hospitals did not want to employ men who would at once be called away. He suggested, for Wandsworth, that "no candidate for appointment to the position of house-physician, house-surgeon, registrar, or member of the honorary staff of any hospital shall be asked to state whether he is or is not a member of the Territorial Army or other auxiliary forces of the Crown."

Mr. McCURRICH asked how hospitals in reception areas are to be carried on if they are filled with refugees and the majority of the staff are removed. Nobody wished to penalise anyone joining the Territorials, but how was the work of hospitals to be done if men were appointed to them who would leave at the beginning of an emergency? Dr. LEWIS replied that posts should be filled according to the ability of the candidate and nothing else. Mr. McCurrich's hospital should not punish applicants because of a possible war; it should have a shadow scheme that would work without them. Dr. E. R. C WALKER thought it impossible to prevent prospective employers asking about the military obligations of employees; but it might be laid down that such obligations should not stand in the way of their appointment.—The suggestion was referred to council.

Dr. C. M. STEVENSON said that his "safe" area, with a population of 100,000 or so, had been told that it would receive 25,000 children, 1000 blind, and 300 women on the point of confinement. Many of the local doctors would have been called up and "we want to know what we're to do about it." Sir KAYE LE FLEMING told him that the Government has accepted responsibility for payment for the medical care of the officially evacuated. He also assured Torquay that in war-time steps would be taken to supply practitioners with petrol.

The meeting unanimously approved a motion by Dr. GLADYS BOYD, for Edinburgh, that medical officers should be attached to the Women's Auxiliary Services, that these medical officers should be women, and that they should examine recruits.

Afterwards

Schemes are being devised to ensure that practitioners undertaking service shall find their livelihood preserved on returning after a war. Dr. WARD said that in time of war all practice in London and some of the large towns might cease, whereas there would be an increase in reception areas. His division, Torquay, thought the proposed plans for filling in cards to be forwarded once a month to a classifying bureau would break down. It might be preferable for the practitioner treating the case to give half the fee to the patient's own doctor. To this belated criticism Sir KAYE LE FLEMING wrathfully replied that the card system had been approved after consultation with areas where schemes were worked successfully during the late war, and was now ready for operation in four-fifths of the country.

The council has recommended that when a practitioner is called up in *peace-time* under the Auxiliary and Reserve Forces Act the names of his insured patients attended in his absence by another practitioner shall be restored automatically to his list "except in the case of those insured persons who express a wish to the contrary." Dr. J. B. S GUY wanted this exception removed, since patients might get used to their temporary doctors and the absentee might suffer great loss of practice. Mr. A. HEDLEY WHYTE thought the words positively give a lead to patients to stay with their new doctor. Sir KAYE LE FLEMING, commenting on the plan that patients should be compelled to return to the absentee practitioner's list for a year, remarked that the B.M.A. holds by free choice of doctor. Under existing law the term of peace-time service was limited to three months.

This motion was lost, however; for, said Sir KAYE LE FLEMING, this is a free country, and "what restrictions can we provide to prevent such a thing happening?" If all appointments went through the local emergency committee they would have a good chance of objecting.

Hospital Contributory Schemes

The revised hospital policy of the B.M.A. sets out a scale of incomes above which (it is suggested) no-one should be allowed to join a hospital contributory scheme or receive free treatment at hos-

pital from the visiting staff The upper limits of income are as follows :—

1 Single persons over 16, or widows or widowers without children under 16 £200 a year, or £4 a week.

2 Married couples without children under 16, and persons with one dependant under 16 £250 a year, or £5 a week

3 Married couples with a child or children under 16, and persons with more than one dependant under 16 £300 a year, or £6 a week.

These limits, it is stated, are applicable to London, elsewhere they would need to be lower, according to the local circumstances

East Yorkshire and Exeter proposed that each of these income limits should be reduced by £50—i.e., to £150, £200, and £250—with scope for periodical revision The higher scales, said Mr RITCHIE RODGER, were a very bad bargaining instrument, they put the onus on the profession to prove that they are too high for a particular area, whereas the onus ought to be on the other side The income limits were personal limits, and four figure families could slip through the net, moreover no account might be taken of subsidiary sources of income Everyone admitted that a man with £300 a year might find it hard to produce £40–£50 for an operation, but there were now provident schemes to aid him Dr F GRAY said that the contributory schemes were on trial, and it was always unwise to state maximum terms at the outset Dr H S HOWIE WOOD remarked that it is not until a contributory scheme has been in action for some time that one discovers the damage it does to private practice Dr A BEAUCHAMP, on the other hand, thought that if the level is reduced too low it would be very bad for the contributory associations, which collected money for hospitals and did not all guarantee treatment Did the B.M.A. want to put another nail in the coffin of the voluntary hospitals? Dr PETER MACDONALD (chairman of the hospitals committee) said that if the association put forward too low a figure it would antagonise the hospitals They were already conceding professional claims, for instance, the British Hospitals Contributory Schemes Association had agreed that services conveniently obtainable from private practitioners should not be given at hospital Mr RITCHIE RODGER, who sees the poor being squeezed out of hospitals by people with £300 a year, again urged the damaging effect of contributory schemes on general and consultant practice, but he failed to persuade the meeting to make his desired reduction of £50 in the scales submitted

The next part of the draft hospital policy to come under fire was the following paragraph —

"It is undesirable that private patients should be seen or treated at the outpatient department of a hospital unless such an arrangement is necessary in the interests of the patient It is recognised that certain forms of treatment involve the use of costly apparatus most readily available at hospitals, and that team work, so often essential, can be organised more easily at hospital Where the treatment of private patients is in fact arranged at outpatient departments the *following conditions should* apply "

Dr S WAND saw in this an insidious approach to toleration for the practice of medicine in hospitals Exceptions were necessary, for example, deep X-ray therapy must be given in a suitable department, and there are places where a visiting specialist has no facilities for working except at a hospital But the above paragraph left the door wide open to abuse What was meant by the "interests" of the patient, by "most readily available" or by "can be organised more easily" or "team work"? He saw a time coming when patients would be shepherded by contributory schemes to the outpatient departments, there to be seen by consultants whose fees would be assessed by the hospitals and contributory associations, he saw a time when *consulting practice* would be possible only under the control of hospitals, and only by those they see fit to appoint

Dr MACDONALD, in reply, accepted the words "in the *medical* interests of the patient", but opposed Dr Wand's proposed omission of the whole of the next sentence More and more private work, he said, is going to be done at hospitals, and the sooner we recognise this the better for the patient, the better for the hospitals, and in the long run the better for the consultants "Aha," replied Dr WAND, "Dr Macdonald has at last given himself away" There were two schools of thought about the desirability of private work being done at hospitals and the meeting must decide—It decided in his favour, omitting the words from "It is recognised" down to "more easily at hospitals" It also added, on his proposal, a statement that "at the earliest possible moment the results of the investigations and suggested treatment should be communicated to the practitioner, to whom the patient should be returned for treatment as soon as practicable"

Brighton then produced the case of the member of a contributory scheme whose income, though £300 a year or less, is derived partly or wholly from investments Money spent on the maintenance of health, said Dr A W GARDNER, should be treated as capital expenditure The small capitalist should be debarred from a contributory scheme, for an income of £250 at 3½ per cent represented £7100, and even if the patient had to sell £100 of shares to pay his fees he would still have £7000 and lose only 1*s* 2*d* a week of his income The non-admission of such people had been dismissed last year as impracticable, but it was in operation at Plymouth Consultants, said Mr MCCURRICH, will gladly give gratuitous service to the necessitous poor, but are people with £7000 necessitous poor? Dr S. NOY SCOTT testified to the successful work of an "eligibility" committee at Plymouth since 1932 Dr MACDONALD maintained that the very few people affected could not be controlled, and that contributory schemes would refuse to make inquisitions into their members' source of income Dr LEWIS thought it inequitable to ask a man to give up 1*s* 2*d* a week for the rest of his life, since one would never ask a workman to surrender permanently part of his wages The meeting, however, agreed with Dr GARDNER that this would not be a terrific burden for the sake of health, and the Brighton resolution was carried.

Monopoly of Pay-beds by Consultants

Dr R BOYD asked the representative body to view with concern the method by which auxiliary hospitals, and nursing homes connected with hospitals, are being monopolised by specialists and consultants on the staff of hospitals, to the exclusion of general practitioners. The opening of homes attached to hospitals, he said, meant the closing of the private nursing homes to which practitioners have sent their patients, and consultants were taking over practitioners' work The London provident scheme offered payment to patients for nursing home care—but only if they were under the care of a consultant

Mr ZACHARY COPE said it was only right that consultants giving two thirds or more of their time to gratuitous work at a hospital should have a prior claim to the use of pay beds attached to it But the

general practitioner should be able to look after his patient after operation (Dr. H C. PURCER SMITH was surprised to hear that the surgeon's task ended when the operation was over.)

Dr. MACDONALD believed that the basic difficulty is that there are not enough hospital beds in the country to allow practitioners to have them. They must be kept for urgent cases or those requiring specialist attention But he reminded Dr Boyd that the B M A policy already urges the advantages of the "open door" and speaks of provision for patients and doctors who have formerly used nursing-homes.

The Midwife as Anæsthetist

Hitherto the B M A. has maintained that only doctors and dentists should administer anæsthetics The council now recommends that the midwife's right to give nitrous oxide and air during labour should be recognised, under certain conditions, one of which is "that the patient has within one month before her confinement been examined by a registered medical practitioner who has handed to the midwife a certificate in writing that the patient is in a fit condition for gas-and-air administration." A lively but complex discussion arose on this proposal, put forward by Dr J. W. BONE as chairman of the general practice committee.

Dr A. S. WIGFIELD, for East Herts, asked how a practitioner was to say that in a month's time a woman would be fit to have an anæsthetic from a midwife. If midwives could decide whether a woman needed medical aid during labour they could decide whether she could stand gas and oxygen.

Dame LOUISE MCILROY begged the meeting not to reject this one and only medical safeguard on a quibble about a day or a month The profession was allowing midwifery to slip from its hands, and not making an effort, as it should, to keep control of antenatal care Sir EWEN MACLEAN likewise advised that the doctor should keep in touch with the midwife's work; and so did Sir BECKWITH WHITEHOUSE, who did not much mind whether the examination is made one month, two months, or three months before labour, so long as it is made

Two Scottish representatives, Dr. J B. MILLER and Dr E. K MACKENZIE, explained that in the enlightened north anæsthetics for midwifery can be given only by registered practitioners They were horrified by the discussion. "Good gracious me," said Dr. Mackenzie; "you English people, come to your senses!" But Sir EWEN MACLEAN was unmoved. In many areas south of the Border, he said, more than 70 per cent. of confinements were attended by midwives, and to discourage the use of anæsthesia by them would be a disservice to the public

On the question whether midwives could safely use gas and air, Dr. J C A. NORMAN declared that true anæsthesia could be induced with a Minnitt apparatus, that anæsthetics (an art) could not be taught quickly, and that the presence of another midwife or student as laid down in the regulations made it all the more dangerous, because more gas could be given Another speaker described gas as one of the most dangerous anæsthetics Mr A. M. A MOORE, by contrast, considered the gas-and-air machine absolutely safe and simple; and Dame LOUISE MCILROY described it as safe as far as safety can go.

The more important argument, however, centred round the effect of the regulation and the effect of approving it. Dr. J. E STACEY and many others wanted to stop midwives controlling the midwifery of the country. He thought that few medical men would certify that a woman would a month later be fit for an anæsthetic, and so in fact the anæsthetics would not be given unless (as was proper) a practitioner had charge of the case. Other speakers urged that if the B.M A held that every woman in childbirth should be under the care of a doctor—who was able to meet emergencies, anæsthetic and otherwise—it should say so. "Our job," said Dr FORBES, "is to say what's ideal"; the B M A. decision would not stop midwives giving gas, but there was no reason why the B M A. should go out of its way to authorise it.

Dr P. PHILLIPS almost won the meeting's approval for an amendment allowing midwives to administer analgesia rather than anæsthesia; but Dr. FORBES and Dr O C CARTER successfully claimed that these cannot be differentiated. The meeting then declared itself opposed to the council's decision; and the B M A. policy will therefore make no mention at present of the giving of anæsthetics by midwives.

Information to Insurance Companies

Dr. A. M. JOHNSON, for Bury, questioned the propriety of supplying insurance companies with a "duration of illness" certificate after the death of a patient. The insurance company wanted to discover whether the person insured was healthy when he took out the policy; if not, it would dispute the relatives' claim. But if insurance companies took the risk of issuing policies without medical examination why should they be covered retrospectively if they backed a loser? Often patients in poor health were bullied into insurance If certificates of this kind were refused the companies would see that there was a medical examination before policies were issued. This last argument was not accepted by all speakers and Dr W. J. O'DONOVAN objected that it would be a professional impertinence to say that people shall be insured only "if we have a rake-off first"

Dr. FORBES said it was already possible to refuse a certificate, or to give information only with the relatives' consent. Sometimes the certificate was useful, since it enabled a claim to be settled favourably at once On the other hand if a doctor refused to issue one the company might sub pœna him before an industrial-insurance court. Dr. JOHNSON believed that the companies would never dare to bring these cases into the light of day. Dr. J CLAYRE thought that companies would find the expense of medical examinations offset by a gain in reputation, since great harm was done in the minds of lately bereaved families by contesting their confident claims Dr. G LAURENCE maintained that companies asked for certificates only to evade responsibilities undertaken with their eyes well open: Dr. N E WATERFIELD said that where that seemed to be so he always refused to certify and advised the relatives to stand on their rights But often it saved much bother to give the certificate asked for. Dr. A A LEWIS refused to consider the bother, if the principle was wrong

Dr. BONE incautiously said that this was an old story; it had often been argued before Dr. JOHNSON replied that if it had been discussed for twenty years, there was all the more reason for getting something done The meeting agreed, and said that "the action of medical practitioners in giving 'duration' certificates to insurance companies (or to the relatives of the deceased at the request of insurance companies) relating to the health of their patients before death should be discontinued."

N.O.T.B.

The council has approved a proposal to convert the National Ophthalmic Treatment Board into a private company limited by guarantee. But the steps proposed "to regularise the position of practitioners associated with the work of the board" have been criticised (see *Lancet*, July 22, 1939, p. 227).

Dr. A. ESTCOURT OSWALD said that ophthalmic surgeons, who would have to accept the terms or lose their work under the National Ophthalmic Treatment Board, had not had time enough to consider the scheme finally announced on July 14. Dr. R. H. BALFOUR BARROW complained that they had to agree to rules that might be varied from time to time by the B.M.A. and to penalties not yet stated. Dr. STEVENSON explained that disciplinary control would rest with the association's ophthalmic group committee—a purely professional body whose proceedings had in turn to be reviewed by the council, and Dr. H. CAIGER condemned the objectors as "again the government." Dr. WAND, however, supported the plea for delay, and though Dr. MACDONALD said it was urgently necessary to complete the arrangements in order to secure legal protection for the letters N.O.T.B., the representative body sympathised with Dr. Estcourt Oswald's objection to signing a document she does not find explicit. The council was asked to reconsider it.

First-aid in Industry

Dr. WAND spoke of the loss to industry from injuries—estimated at £50,000,000 a year. Those giving first aid were insufficiently trained, and too much treatment was done by them and expected of them by employers. Industry had never had a lead from the profession. He presented an appendix to the council's report—since reprinted as a booklet "First aid in Industry"—which, he said, gave such a lead. Subsequently a book of training was to be issued, and leaflets on poisoning, applicable to particular trades. He hoped that the association's message to industry might save both money and misery.

Pasteurisation

Dr. WARD, for Torquay, urged the council to persuade members to do their best to convince the public of the value of effective pasteurisation, "which, while preserving the nutritive qualities of the milk, affords a guarantee against the risk of tuberculosis and other milk-borne infections." On a suggestion being made that it affords only a "reasonable degree" of safety Sir KAYE LE FLEMING said there was now no shadow of doubt that it gives complete protection and in no way diminishes the value or (necessarily) the palatability of milk. "We have with us," he said, "the Ministry of Health and the Board of Agriculture, we have against us an ill-informed public opinion, an *ill informed* House of Commons, and an ill *informed* agricultural industry." The ministries said that they could not legislate in advance of public opinion.

Dr. R. MAULE HORNE declared that the new Milk Bill, without mention of pasteurisation, meant that more mothers and more babies will drink more unsafe milk. The cause of safe milk had had a set-back, and effort must be redoubled. Dr. W. S. MACDONALD said that the B.M.A.'s advocacy of pasteurisation had aroused enmity among farmers and small distributors, some of whom were trying hard to clean up their milk, and to produce clean milk was better than to heat dirty milk. Dr. A. W. GARDINER also preferred raw milk and said that it does not cause pulmonary tuberculosis. Dr. P. W. EDWARDS regretted that many pasteurising firms, caring more for money than milk, do their work badly and lead their customers into a fool's paradise. In Scotland, he added, 4 per cent. of pulmonary tuberculosis is due to bovine infections and in his own district 2·2 per cent. These percentages represented very large totals. Dr. C. O. STALLYBRASS also pleaded for pasteurisation and Dr. A. A. EAGGER related how a diet of milk from tuberculin-tested cows had given him undulant fever.

Torquay's motion was passed with only 5 dissentients.

Diphtheria Immunisation

The City of London moved that in view of the small proportion of children immunised against diphtheria and the danger of the disease spreading among those evacuated in war time, steps should be taken to press the public to accept inoculation. Dr. J. FETTES, proposing, said that only 5·6 per cent. of London children had been immunised, and assuming that 20 per cent. are naturally immune, this meant that three-quarters of the child population is susceptible. In Aberdeen county, he was informed, 75 per cent. of parents consented to immunisation and in Aberdeen city over 50 per cent. But in an emergency Aberdeen would have to receive 32,000 child evacuees, and before inoculating any of them written consent from the parents or guardians would have to be obtained. He deplored the apathy of practitioners towards this wholly preventable disease, they often did not care to give two injections at 2s. 6d. each. Dr. C. O. S. BROOKS said this apathy was harder to overcome than opposition, but the B.M.A. could overcome it if its members showed they are convinced of the necessity and safety of prophylaxis. Dr. A. MCCARTHY pointed out that the best publicity is that given by the individual doctor attending his patients. Practitioners should offer their services for this purpose to the medical officers of health. Dr. R. A. WILSON described the measures now adopted by Guernsey, where next week every child between two and ten years old will have been immunised. Dr. MELVIN said that the number of deaths from diphtheria in England and Wales is equal to the number of deaths of women in child-birth. All the deaths from diphtheria could be prevented for a fraction of the money spent on reducing maternal mortality.

After Professor PICKEN, as chairman of the public-health committee, had expressed his pleasure that such an initiative, on a purely preventive issue, should come from general practitioners, the City's motion was carried without dissent. A further motion, suggesting that compulsory immunisation of children should be recommended to the Government, was withdrawn.

A Woman for the G.M.C.?

Two direct representatives are to be elected this autumn to the General Medical Council, and Dr. WARD, for Torquay, besought the meeting to say that one of the nominees of the association should be a woman. Dr. STEVENSON pointed out that no woman is likely to be appointed from any other source, and Dr. T. CRAIG believed that it would be an asset to the G.M.C. to have one. But every other speaker except Dr. A. A. LEWIS, was against the proposal.

Dr. F. A. ROLPH said that there was at present no bar, any electing body could choose a woman. Indeed the late Dr. Christine Murrell had been an outstanding member of the council, though she had

not lived to take her seat. If a woman were elected as B.M.A. nominee for England and Wales the women doctors of Scotland and Ireland might have a grievance. No minority should be given exclusive representation; it would be as reasonable to ask it for doctors with red hair. Dr. WATERFIELD held that women want equality, not privileges, and the only woman speaker, Miss BEATRICE TURNER, agreed with him, saying that women should be appointed on their merits, not as weaker vessels. If a woman was wanted, said Dr. S. A. FORBES, the machinery for her election was fully available.

So far as the association is concerned this machinery will continue to work as hitherto; for the motion was rejected

Officers of the Association

Sir BECKWITH WHITEHOUSE, F.R.C.O.G., was elected president for 1940–41, to take office when the association visits Birmingham next year. Sir KAYE LE FLEMING, chairman of council, was elected a vice-president, and on the retirement of Mr. N. Bishop Harman from the office of treasurer, after fifteen years' service, Dr. J. W. BONE was elected treasurer in his stead. Dr. H. G. DAIN and Dr. PETER MACDONALD remain chairman and vice-chairman of the representative body.

Dr. Dain's most sensational action at last week-end's meeting was to take a roll-call of representatives. About the middle of Saturday morning, the number present had fallen well below the quorum of 50 per cent; and, *horribile dictu*, not every absentee had asked personal leave of absence as standing orders require

(To be continued)

MENTAL HEALTH

SUGGESTED MERGER OF VOLUNTARY AGENCIES

THE formation of the Feversham committee, whose report * has just been issued, was the outcome of a widespread movement towards the coördination of the voluntary mental-health services. The Board of Control, as the central statutory authority for mental health, have taken an important part in coordinating the various branches of the official mental-health services and in bringing together the voluntary organisations associated with these services. The report of the Feversham committee quotes an extract from the annual report of the Board of Control (1935) which states their attitude in clear and forceful terms:—

"The Board have noted with pleasure the growing movement in favour of combining, whether by complete amalgamation or by federation with a central body, all the various voluntary agencies interested in different aspects of mental health. The want of unified direction and a comprehensive central body able to view the problem as a whole has made the mental hygiene movement relatively ineffective in this country. Without some measure of union, or at least of coördination, no effective appeal can be made to the public for financial support and, an even graver source of weakness, no real advance can be made in educating public opinion so that the needs and possibilities of the work may be more fully realised. The development of any health service depends upon close cooperation between voluntary effort and governmental or municipal activities. Legislation in advance of public opinion is almost always inoperative, nor can local authorities be criticised for failing to do more than their constituents want them to do. There are limits to the extent to which central departments can influence or, indeed, ought to attempt to influence public opinion. It is therefore all the more important that the present multiplicity of voluntary organisations should be coordinated if the importance of mental hygiene is to be adequately realised."

This statement of the Board of Control is at once a challenge and an encouragement to the voluntary mental-health services. The Feversham committee have taken up the challenge and produced a comprehensive report showing both the defects of the existing voluntary services—lack of coördination on the one hand, and overlapping and waste of effort on the other—and the methods by which these defects should be remedied. In the preparation of the report the committee have taken evidence from practically every source which might be expected to afford relevant information. Questionnaires were sent to all government departments dealing with mental health from any angle, to the councils of all administrative counties and county boroughs, and to all voluntary mental-health societies and clinics. Besides, special information was sought from individuals selected either because of their specific knowledge of mental-health work or for their general experience of public and social affairs. The replies to these questionnaires were carefully classified by the committee, and the report is the final outcome of the evidence which was studied and sifted.

PRESENT STATE OF MENTAL-HEALTH SERVICES

The Feversham report falls naturally into three main sections. The first deals with the mental-health services, both statutory and voluntary, as they are today. It shows how these services grew up, each in response to a particular need, and how lack of coordination was inherent in this haphazard form of development. The statutory position of mental disorder, mental defect, and delinquency is fully discussed, and special reference is made to defects in the law which have had an adverse effect on the growth of the voluntary services. In the realm of mental deficiency, for example, the stigma of certification before appropriate education can be provided for a child is once more condemned, and the anomalies of notification of defective children to the statutory authority are clearly brought out:—

"There can be no doubt that the object of notification is to secure proper supervision for a child who is socially defective. Yet the law is so framed that (with minor exceptions) . . . only those children who have been in attendance at special schools or classes can be notified to the mental deficiency authority. This restriction is in our opinion indefensible. It is the greatest single obstacle to successful community care of defectives. The replies which this committee have received show that the overwhelming majority of mental welfare associations lament the fact that the very children who are in greatest need of supervision after they leave school are denied this benefit *because they have also been denied the opportunity of receiving instruction in special schools or classes.*"

The report also shows that the statutory powers under the Education Acts are too limited to encourage the development of modern services for the child. The committee feel that the time has come for granting frank specific powers of contribution by local-education authorities to voluntary services such as child guidance and the institutional care of difficult children.

* The Feversham Committee (47, Whitehall, London, S.W.1). The Voluntary Mental Health Services, 2s. 6d.

MENTAL HEALTH CLINICS

In the second main section of their report the committee deal critically with the evidence which they have received A considerable mass of information has been accumulated to show that the establishment of mental health clinics throughout the country is a great and urgent need It is clear, however, that the present position is far from satisfactory Some authorities are paying only lip service to the provisions of the Mental Treatment Act, 1930 Some of the clinics which have been organised meet only once a month and do not provide even the rudiments of an efficient service, some are so overcrowded that individual attention is impossible, and others are either understaffed or attended by inadequately trained personnel The committee take the view that the normal situation for a diagnostic outpatient clinic is the general hospital, except in the great cities where a clinic established for mental health purposes, can within its own bounds provide all facilities for physical as well as mental investigation The minimal requirements of an efficient clinic are discussed, and great emphasis is laid upon the value of fully trained psychiatric social workers Although it is agreed that, in general the most suitable location of an outpatient clinic is in association with a general hospital, it is admitted that few such clinics in fact provide a sufficient number of separate rooms for effective work, and that the accommodation is often otherwise unsuitable— dismal ill decorated rooms, uncomfortable furnishing, and a general lack of attention to those little, delicate homely features of decoration which make all the difference between the cold atmosphere of an institution and the warm, attractive surroundings of a room which inspires confidence and a sense of peace "

The scope and limitations of the mental health clinic are examined, and the view is expressed that the mental health service in the average area should be a single organisation. The clinic should therefore deal with patients of all ages who are likely to benefit by psychiatric treatment Mental defectives as such would be excluded, except in so far as they presented psychoneurotic conditions or problems of conduct and social adjustment susceptible of treatment

INSTITUTIONAL TREATMENT

In the chapter relating to mental-hospital treatment the committee point out that in many areas the provision for early cases is scanty, especially for patients suffering from recoverable forms of mental disorder who are not willing to go as voluntary patients to mental hospitals and yet would be willing to undergo treatment if it were available elsewhere The evidence of existing conditions is summed up as follows —

(1) A steadily increasing use should be made of the facilities for voluntary treatment provided at the more progressive mental hospitals

(2) Very many local authorities have not yet made full use of their powers to admit voluntary patients

(3) There is lack of cooperation between the various agencies providing inpatient accommodation for mental cases—mental-hospital authorities, public-assistance authorities, and voluntary bodies

(4) The need for special accommodation for early and transient non certifiable cases is not fully appreciated

The committee urge that voluntary effort could do much to meet this need if coöperation could be secured The remedy which the committee suggest is resolved into two propositions (*a*) where one of the great medical teaching centres is within reach, a special hospital for early mental and functional nervous disorders should be established in close association with the teaching school, and (*b*) where no teaching centre is available, a special block for early cases should be established in close connexion with or at the general hospital serving the area

MENTAL DEFICIENCY

In the chapter dealing with mental deficiency the most urgent problem in mental health arises from lack of coöperation within the statutory area itself At least four committees of a local authority may have mental health functions, and in many areas little progress has been made towards coöperation The committee feel that one of the most important contributions which voluntary associations can make to the community care of defectives is to link together all the agencies, both statutory and voluntary, in a single enterprise so that no part of the field is left uncovered

MENTAL HEALTH OF CHILDREN

In an interesting chapter devoted to the mental health of children it is suggested that prevention, in the sense of promoting positive health, is the most important aspect of child guidance Child guidance should not stand alone, it operates most effectively through the existing agencies for child welfare and education The great majority of the difficulties and maladjustments of childhood can and should be dealt with inside the ordinary educational system especially through coöperation between home and school Voluntary effort has two functions in relation to the mental health of children preliminary organisation to demonstrate throughout the country the need for a child guidance service, and assistance even in the fully established clinic to the trained personnel to provide the right atmosphere of friendly informality

EDUCATION OF THE PUBLIC

Publicity has come to stay, as a feature of modern life, and propaganda has great powers for good as well as for evil The report of the Feversham committee lays a just emphasis on the importance of public education in mental health and offers constructive suggestions on the best means of making it effective At the same time a salutary warning is given against the risks of unskilled presentation of mental health problems, especially that which lays emphasis on the pathological rather than the normal The aims of public education are summarised thus —

(1) To foster a healthy attitude towards mental illness, regarding it as similar in all essentials to physical disease, with a definite pathology and with genuine possibilities of prevention, alleviation, or cure

(2) To educate the public in the principles of normal psychology and mental hygiene especially with regard to the child

(3) To explain and to spread knowledge of the functions of the mental health services, including mental hospitals clinics for early disorders, and facilities for the promotion of mental health in children

ORGANISATION OF MENTAL HEALTH SERVICES

After setting out in summary form their principal recommendations, the committee proceed to discuss, in the third section of the report, what is in a sense the most immediate problem—the internal organisation of the voluntary mental health services In their view, lack of coördination exists to such an extent that the services do not give full value in return for

the time, money, and effort spent upon them The evidence proves the committee's case beyond doubt and shows that the earlier methods adopted to secure cooperation between the various voluntary agencies have all failed in their object, because they have not achieved unity of effort. The only policy which has a claim to far-sighted statesmanship is complete amalgamation, and the committee's scheme not only promotes amalgamation but also shows in a thorough practical way how it can be carried out. It is recommended that a new central voluntary body be set up for England and Wales to be called the National Council for Mental Health This body is to be the product of fusion between the existing central voluntary associations directly concerned with the promotion of mental health the Central Association for Mental Welfare, the Child Guidance Council, the Mental After-Care Association, and the National Council for Mental Hygiene Agreement has already been reached in principle between three of the associations; it appears that the Mental After-Care Association has not yet seen its way to cooperate.

The aims of the new council are comprehensive; their chief object is to create in the public mind a new outlook on mental health and a new understanding of its meaning. The creation of a single central voluntary association should go far to stimulate the interest of local authorities by organising training and establishing recognised standards of competence. Coördinated voluntary effort is also greatly needed for the promotion of research and the collection of authoritative records It is to be hoped that the new council will be successful in awakening greater public interest and active support in the much neglected field of mental health in this country

BEIT MEMORIAL FELLOWSHIPS FOR MEDICAL RESEARCH

A MEETING of the trustees of the Beit Memorial Fellowships for Medical Research was held on July 19 They received with regret the resignation from the advisory board of Sir Gowland Hopkins, O M, who throughout the long period of 25 years had given wise counsel at the meetings of the board and in his biochemical department at Cambridge had directed the research studies of perhaps a greater proportion of those elected to Beit fellowships than any other head of a department has done They also regretted the resignation of Sir Patrick Laidlaw, F R S, after eight years of keenly attentive work These vacancies were filled by the appointment to the board of Dr. R. A Peters, F.R S, Whitley professor of biochemistry in the University of Oxford, and of Dr Paul Fildes. F R.S, bacteriologist on the scientific staff of the Medical Research Council It was reported that C H O'Donoghue (fellow 1912–13) had been appointed to the professorship of zoology in the University of Reading; J T. Irving (1926–28) to the professorship of physiology in the University of Cape Town, G F Marrian (1927–30) to the professorship of chemistry in relation to medicine in the University of Edinburgh; F H Smurk (1930–34) to the professorship of medicine in the University of Otago; and H P Himsworth (1932–35) to the professorship of medicine in the University of London at University College Hospital

It was in 1910 that the first Beit fellow, now Sir Thomas Lewis, F R S, was elected, and last year's election in 1938 brought the total of all fellows elected to exactly 200 Women are eligible and have been elected from 1910 onwards, their total being 30 out of the 200 Of the 170 men, 6 have been elected to the fellowship of the Royal Society, and no less than 34 have already been appointed to university professorships, of which 5 were in physiology, 5 in pharmacology, 5 in medicine and 9 in chemistry or biochemistry. The Dominions overseas hold 8 of these past Beit fellows as present professors None of the women have yet been promoted to university professorships, though at least 6 of them are doing work of much distinction and one has for some years been director of an important research laboratory. The opportunities for a woman to obtain a university chair in scientific subjects are still restricted Though the fellows have come from all parts of the British Empire and have subsequently gone to laboratory posts all over the world, in their choice of a place of research during their fellowships they have tended to group themselves at three main centres. Out of the total 200 the laboratories of the University of Cambridge have held 55 fellows, and 29 of these were personally directed by Sir Gowland Hopkins in the great biochemical school that he developed in the Dunn Laboratories immediately after their opening in 1925 University College and University College Hospital in London together have provided opportunities for the work of 39 fellows. The Lister Institute of Preventive Medicine has accepted 35 A total of nearly £190,000 has been disbursed to fellows since 1910.

The following elections to fellowships were made:—

FOURTH-YEAR FELLOWSHIPS

ISAAC BERENBLUM, M D, M Sc Lond To continue his work on the production of cancer by skin irritants, and to study the metabolism of living cells in tissue culture. At the school of pathology, University of Oxford

THOMAS ARTHUR HOWARD MUNRO, M B Edin, F R C P E To continue his studies of the rôle of inheritance in mental disorders At the Royal Eastern Counties Institution, Colchester

ALBERT NEUBERGER, M D Wurzburg, Ph D Lond To extend his work on the chemistry of amino sugars in elucidation of the structure of natural compounds At the department of pathological chemistry, University College Hospital medical school, University of London.

RICHARD JULIUS PUMPHREY, Ph D. Camb To continue his studies on the nervous system of cephalopods and on the auditory processes in insects At the zoological laboratory, University of Cambridge, and the laboratory of the Marine Biological Association, Plymouth

JUNIOR FELLOWSHIPS

VERNON HOLLIS BOOTH, Ph D. Camb. George Henry Lewes student, 1935–38 Ramsay memorial fellow for chemical research, 1938–39. Proposed research. (1) the analysis of internal constituents of bacteria with a wet-crushing mill, (2) carbonic anhydrase At the physiological laboratory, University of Cambridge

ERIC GEORGE LAPTHORNE BYWATERS, M B Lond, M R C.P. Assistant clinical pathologist, Middlesex Hospital, 1935–36, Rockefeller research fellow in medicine, 1937–38 Proposed research: rheumatoid arthritis At the British Postgraduate Medical School, University of London.

WILFRED INGRAM CARD, M D Lond, M R C P Since 1935 medical registrar and tutor to the medical unit, St Thomas's Hospital Louis Jenner research fellow at the hospital, 1938 and 1939 Proposed research: the inhibition of gastric motility and secretion by experimental studies on man At the medical unit laboratories and Sherrington school of physiology, St Thomas's Hospital medical school, University of London

HANS HELLER, Ph.D Prague, M B Camb Assistant to professor of pharmacology, University of Vienna,

1929–34 Proposed research the antidiuretic principle of postpituitary extract At the medical unit laboratories, University College Hospital medical school, University of London

MAXWELL SHAW JONES, M D Edin, D P H Walter Smith Kay research fellow in psychiatry, University of Edinburgh, 1934–36 Commonwealth Fund fellow, 1936–38 Proposed research insulin treatment of schizophrenic mental states At the Maudsley Hospital, University of London

BARNETT LEVIN, Ph.D Lond Fedler research scholar, Institute of Chemistry, 1931 32 Since 1932 lecturer in chemistry at Guy's Hospital medical school University of London Proposed research the effect of spatial configuration of antigens on immunological reactions At the clinical chemical laboratories of the London Hospital, University of London

IAN MACKENZIE, M B Edin, F R C S E Vans Dunlop scholar in bacteriology, University of Edinburgh, 1933 Rockefeller research fellow 1938 Proposed research immunological investigations on constituents of tumours At the department of surgical research, University of Edinburgh

ALEXANDER FRANCIS RAWDON SMITH Ph D Camb Senior student of the 1851 exhibition, 1936–37 and 1938–39 Rockefeller Foundation fellow, 1938 Proposed research congenital deafness At the physiological laboratory, University of Cambridge

BASIL ROLAND RECORD, Ph D Birm Department of Scientific and Industrial Research award, 1937–39 Proposed research the specific soluble substance found in the tissues in acute vaccinal infection At the Lister Institute of Preventive Medicine, University of London

All correspondence of fellows and candidates should be addressed to Prof T R Elliott, F R S, hon secretary, Beit memorial fellowships, University College Hospital medical school, University Street, London, W C 1

AUSTRALASIA

(FROM OUR OWN CORRESPONDENT)

CHAIR OF MEDICINE AT DUNEDIN

Prof F H Smirk of Cairo has been appointed to the chair of medicine at the national medical school, University of Otago At present professor of pharmacology in the Egyptian University, and physician in the postgraduate section of the University Hospital, Prof Smirk was chosen from a large field Since graduation at Manchester in 1925 he has stuck closely to practical scientific medicine and research, working at Manchester, Vienna, University College Hospital, and Cairo His chief interest in recent years has been high blood pressure, but in the past he has worked at problems connected with heart and kidney

Dr D W Carmalt Jones and Dr F Fitchett, who are retiring at the age limit, have shared the responsibilities of the chair of medicine for twenty years They had endeared themselves to their students and will carry universal goodwill with them into retirement Their appointments were part time ones The new appointment is a full time one, carrying a higher salary than most other academic appointments in New Zealand

An urgent need in the Dominion is the development and better organisation of clinical teaching in the other three large centres—Auckland, Wellington and Christchurch—where students may go for their sixth, solely clinical, undergraduate year Postgraduate teaching also awaits development

MEDICAL EDUCATION

As a fitting conclusion to the recent postgraduate course conducted in Brisbane, Sir Alan Newton, senior surgeon at the Royal Melbourne Hospital, delivered the Bancroft oration on "The Making of Medical Men" He said that the number of medical students in Australia has greatly increased in the last few years, and in an attempt to discover the explanation an analysis has been made of reasons given by a group of students for choosing medicine as a career In 12 per cent of these parents insisted, 7 per cent found it the least objectionable of all the academic courses, 7 per cent took it up as an auxiliary hobby (such as being a medical missionary), 7 per cent followed in their fathers' footsteps, for 10 per cent it had been an ambition since childhood, and for 31 per cent it was due entirely to chance. With these figures in mind the natural inaptitude of a large percentage of students is not surprising, and Sir Alan suggested that some method of selection and elimination of the unfit should be instituted, based on the first year's work at the university In this way some control could be exercised over the quantity and quality of men entering the medical profession

In order to relieve the increasing tendency to overcrowd the curriculum he proposed that first year subjects should be delegated to schools and taught with English and history to form a cultural background, leaving the first year at the university for anatomy and physiology, that biology should also be taught in schools, importance being attached to principles rather than structural detail, that botany should be eliminated seeing that pharmaceutical preparations are now mostly in standardised form, that psychology, radiological diagnosis and pharmacology should also be omitted (this last being merged into therapeutics), that lectures on anæsthesia should be replaced by demonstrations, and that the time spent in studying the physiology of the special senses should be reduced Special subjects would then be taught after graduation On the other hand, he suggested that every medical school should have attached to it a medico social clinic with provision for students to visit the homes of patients so that they might understand their social and economic background and its relation to their physical condition

REFUGEE DOCTORS

In all the Australian states refugee doctors are now debarred from immediate registration as medical practitioners even though their qualifications and experience may be beyond all reasonable doubt In most cases applicants are required to graduate through an Australian medical school. These restrictions are designed, of course, not only to ensure that a foreign doctor is fitted to practise his profession in Australia but also to protect those already in practice from undesirable competition, and to safeguard the prospects of the younger men and women who are now qualifying At the same time it seems foolish for Australia to reject the medical knowledge skill and experience that are being brought in by refugees from Europe, especially as there is always a difficulty in supplying the medical requirements of remote country districts Legislation is under consideration in several states by which a system of regional registration would be instituted for foreign doctors who have the necessary qualifications This regional registration will allow a foreigner to practise only in a specified area It is proposed that certificates should be issued for one year only, subject to renewal at the end of that time After five years a foreign doctor would be entitled to seek registration among the general body of medical practitioners in the state

The British Medical Association maintains that,

since the shortage of medical practitioners in country areas is caused not so much by there being too few doctors as by the inadequate remuneration, these districts are as little likely to attract refugees as Australians. The local branches of the association contend that the proposed subsidy of £500 per annum is quite insufficient for any practitioner whether of foreign or British training, and that it should be increased to £1000 The association feels confident that there would then be a good supply of British practitioners for the country districts, but if not it would not object to foreign graduates filling the positions.

EXTENSION OF MATERNITY SERVICES

The institution by the health department of New South Wales of better medical facilities for mothers during the actual natal period opens up a new development in the state's maternity services. Extended antenatal and postnatal facilities have been available for some time The present scheme will cover the *vital* intermediate period It provides that the services of accredited obstetric consultants will be made available in any abnormal maternity case, irrespective of the financial circumstances of the patient; that a mobile blood-transfusion unit attached to one of the metropolitan hospitals will be established; that blood-donors will be paid at the rate of £5 per pint of blood; and that the whole of this cost, together with that of bringing in specialists, will be borne by the department of public health It also provides that every maternal death shall be reviewed within a reasonable time by a special committee, with a view to discovering any loopholes in the scheme and reducing still further the maternal *mortality*-rate.

UNITED STATES OF AMERICA

(FROM OUR OWN CORRESPONDENT)

MEDICAL CARE AND THE STATE

THE responsibility of the state for the provision of medical care was discussed at the annual conference of health officers and public-health nurses of New York state held in Saratoga Springs on June 27 and 28 Dr. E. S. Godfrey, commissioner of health, said that the impression he gained at the National Health Conference was that there is a vast social demand for a change in the method of payment and method of delivery of medical care, and that this demand will not be diverted by a distortion of factual material. He did not favour the Wagner Bill in its present form but not for the 22 so-called reasons promulgated by the American Medical Association. He believed that there should be a single federal authority, that the present procedure for obtaining grants should be simplified and that except for very broad purposes the appropriations made from the federal treasury to the states should be aggregated and that their segregation for specific purposes should be in the discretion of the administrative officer rather than in that of the Congress. In conclusion, he remarked —

"I have no desire to add fuel to a fire that is producing so much heat and so little light, but I do wish to voice at this time a resentment to the implication that men and women in public service are any less worthy, in education, in capacity, in attention, in interest, in devotion to duty, than those who are in what we call 'private life.' I resent the imputation that a salary stultifies, that we must receive a fee for every service rendered or else perform it grudgingly or inefficiently or both. This is no more true of the medical and the nursing professions than it is of those who are by established custom paid for their services in this way. Granted a satisfactory standard of living, the remaining satisfactions are not those derived from monetary income, but from an appreciation of work well done."

Assemblyman Lee B. Mailler pointed out that although the largest volume of medical services in New York state is arranged on an individual basis between doctor and patient the state does spend between 100 and 120 million dollars of its funds for the provision of medical care. He drew a distinction between the availability of medical resources and their utilisation. Services are available in a varying degree because of geographical or other physical barriers. They are utilised to a varying extent because of the more imponderable—but none the less real—economic, psychological or social barriers. Nation-wide surveys have shown that 4 out of every 10 people who are sick receive no medical care either because they *do not* ask for it, do not know where they can get it, do not know that they need it, or think that they cannot afford it.

SCOTLAND

(FROM OUR OWN CORRESPONDENT)

DEATH OF PROFESSOR YOUNG

ON the occasion of his retirement from the regius chair of surgery in the University of Glasgow and from his position as senior surgeon in the Western Infirmary Prof Archibald Young was last week presented with his portrait painted by James Gunn. His death on Sunday has only made the occasion more memorable. Sir George Mitchell, chairman of the Western Infirmary, sketched Professor Young's distinguished career and mentioned that he had been attached to the Western Infirmary for 37 years. Professor Young recalled the many changes which had taken place in the Western in his time. He remembered the time when members of the staff were hardly on speaking terms with each other Now the work of the hospital was better and the benefit to the patients greater for the improved liaison between members of the staff Healthy rivalry had also replaced the old sharp competition between the hospitals of the city. He asked the principal, Sir Hector Hetherington, to accept the portrait on behalf of the university. Sir Hector, in accepting, spoke of the successful manner in which Professor Young had upheld the traditions of the chair of Macleod and Macewan He was a man of strong individuality and—something all Scots respected—a bonnie fighter He imagined that there was hardly anyone present who had not at some time been Professor Young's opponent, but there was no-one with whom Professor Young had been brought in contact who had ever been his enemy. He was a man of great kindness, and nothing had been more characteristic of him than his zeal for the welfare of his students.

RETIREMENT OF COLONEL GREIG

Lieut.-Colonel E. D W. Greig, C.I.E., F.R.C.P.E., is retiring from the lectureship in diseases of tropical countries in Edinburgh University. For many years he has been a well-known figure in Edinburgh medical circles and at the Royal Infirmary, and his cheerful and good-natured presence will be missed The university, however, is to be further indebted to him, for it was announced at the last meeting of the

court that Colonel Greig [illegible] the University his collection of microscope slides, [illegible] photographs, and journals and books dealing with tropical medicine and hygiene.

MEMORIAL LIBRARY TO SIR DAVID WILKIE

In an address at the opening of the Wilkie Memorial Library in the Edinburgh [illegible] Secondary High School Yards, Edinburgh, Dr. T. H. A. Marshall, F.R.S. said he had known Sir David Wilkie as a student. There was a [illegible] which endeared him to all. He had a [illegible] a keenness and a joy in [illegible] he was essentially modest and almost shy about [illegible] which added to his charm. Dr. Marshall said he could speak of Wilkie as a colleague, as a member of the Medical Research Council, and as a friend. He referred to the great and untiring [illegible] which Sir David and Lady Wilkie had taken in the well-being of the work of the settlement. It is a reason [illegible] that funds have been raised for the improvement of the library and its facilities. After the cost of the work has been met a sum of money will be [illegible] for further additions to the shelves.

IRELAND

(FROM OUR OWN CORRESPONDENT)

ACTUARIAL INVESTIGATION OF NATIONAL HEALTH INSURANCE

ABSTRACTS of the report of a special actuarial investigation that has been made into national health insurance in Ireland were published last week. The investigation is distinct from the usual quinquennial valuations, and is intended to help to a judgment of the result that amalgamation of the approved societies has had on the working of national health insurance. It deals, therefore with the first three years—1933–37—following the establishment of the united National Health Insurance Society. The investigation has been carried out by Mr. G. S. W. Epps, of the general actuary's department, London. He has discovered some remarkable differences between the incidence of claims for benefit in Ireland and in Great Britain.

"It will be noted," says Mr. Epps, "that the disablement benefit claims in all three categories—men, spinsters and widows, and married women—range from twice to two and a half times the respective standards of the British valuation basis. Whereas the proportion of men claiming sickness benefit in Eire is only about one-half of that in Great Britain, the average duration of such claims is about 50 per cent. longer. In the case of disablement benefit, however, not only is the duration of claim about 15 per cent. longer, but the proportion claiming the benefit is more than one and a half times as many. Similar features appear in the case of women. As regards sickness benefit, the proportion of all classes is roughly three-quarters of the British proportion, but the average duration is 50 per cent. greater. In regard to disablement, the numbers of spinsters and widows claiming range from one and a half times to double the British figure, but the average duration is not much longer; in the case of married women, however, not only is the proportion claiming from two to three times the British proportion, but also the duration of claim is from 15 to 30 per cent., or more, longer, the disparities being most marked at ages under about thirty-five."

The report notes that in Ireland medical attendance for insured persons does not form part of the national health insurance scheme, provision being made only for the certification of incapacity [illegible] for the work. Whatever effect this absence of benefit for medical treatment may have on the health of the members, it is likely to lead to a considerable increase in the number of claims and, what is more to the point, prolongation of claims. The suggestion is made also that the relatively large proportion of spinsters who continue from Ireland may be a factor which tends to increase the proportion of claims among the small number of those who remain, as those who emigrate are largely drawn from the healthier section of the population.

It is clear that if the claims rate of the society generally [illegible] the amount of [illegible] in the insured population, then the provision [illegible] the financial basis of the system is [illegible]. If the finances of the scheme are to be regulated without abandonment of the principles which have hitherto governed national health insurance in both Great Britain and Ireland, there will then be an increase in the rates of contribution or a decrease in the rates of benefit, or both. Before arriving at such a conclusion however, the actuary remarks:—

"It would appear to be necessary to supplement investigations into genuineness of claims, suppression of claims, certification of continued incapacity, supervision of claims by the society, &c., to ascertain whether the present experience must be accepted as normal and adopted in the consideration of the financial basis governing the future operations of the society."

For several years past those interested in questions of health have been pressing on the government of Ireland the need for a thorough revision of the national health insurance system, and the establishment in connexion therewith of a system of medical treatment. There are inherent difficulties in such a development arising from the necessity for adjustment of a system of medical treatment of insured members with the present system of dispensary treatment for the poor. There is also, from the point of view of the government, the knowledge that any development will give cause for an increase in the state grant, and this difficulty is not diminishing. Again, there are some critics who hold that a system of health insurance directly administered by the state would be both more efficient and more economical than the present system of administration by a society under state supervision. How much and in what direction the actuary's report will influence future development is a matter of conjecture.

BUDAPEST

(FROM OUR OWN CORRESPONDENT)

BUDAVAR

Dr. Sulyok, leader of the national public health institute in Székesfehérvár, investigated some time ago the origin, course and treatment of mud fever. This disease was epidemic in some parts of Germany in 1926–27, and chiefly attacked labourers working barefoot in meadows. Typically, it has a sudden onset, with shivering or shuddering, great prostration, tormenting headache and photophobia; to these symptoms are added loss of appetite, nausea and tenderness of the abdomen on pressure. Now and then rashes appear, sometimes similar to those of morbilli or scarlatina or, more rarely, toxic spots as in typhoid. Fever usually rises to 104° F. and lasts for days. The cause of the condition is the *Leptospira gryppotyphosa*. When an epidemic was raging in

Germany, the disease occurred sporadically also in Russia Last year the disease reached Hungary, and at the Székesfehérvár institute several such typhoid-suspicious cases were reported, which gave negative results to all laboratory tests Although the whole course of the disease very much resembled the initial stage of abdominal typhus, yet all manifestations suddenly came to an end after the lapse of a week. It soon became clear that this was mud-fever. In one village, of 22 men making hay in a wet meadow, 7 fell ill with symptoms pointing to incipient abdominal typhus Their abrupt recovery after 8 to 10 days suggested to the parish doctor the possibility of mud-fever At the same time, in the county hospital in Székesfehérvár, private patients were suffering from a similar complaint. Among them were two physicians who both contracted the disease at a swimming-pool, where they took sun-baths lying on wet grass.

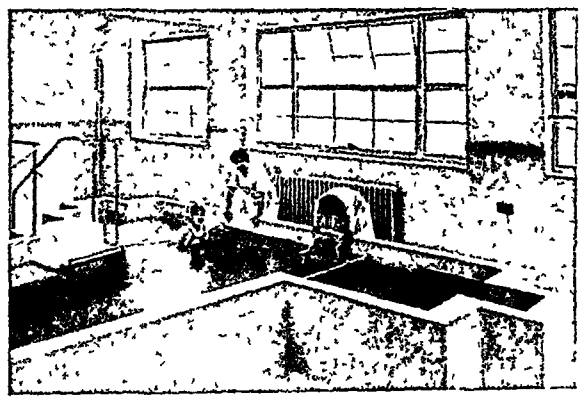
THE NUMBER OF HOSPITALS IN HUNGARY

In the ten years between 1926 and 1936, Prof Georg Gortvay reports a considerable increase in the hospitals of Hungary The number of state hospitals rose from 9 to 31, of clinics and midwifery centres from 33 to 36, of county hospitals from 37 to 41, and of private hospitals of public character from 29 to 41. Private hospitals in which the selection of patients admitted is left to the discretion of the management increased from 62 to 109 Hospitals maintained by the Misericordian Order increased from 4 to 5 The number of prison hospitals decreased from 29 to 24 The number of patients who attended all these institutions rose from 311,898 in 1926 to 584,809 in 1936.

STANMORE ORTHOPÆDIC HOSPITAL

OPENING OF NEW TREATMENT BLOCK

ON July 19 Mrs Walter Elliot opened the new treatment block at the country branch of the Royal National Orthopædic Hospital The hospital had its beginnings in an orthopædic dispensary founded in Bloomsbury by W. J. Little in 1838 which, after two years, developed into the first orthopædic hospital in London. The hospital soon moved to better accommodation in Hanover Square, and in 1845 when it was granted a Royal Charter became the Royal Orthopædic Hospital As interest in orthopædic surgery grew a second hospital was founded in Hatton Garden in 1851, and was called the City Orthopædic Hospital In 1865 yet another hospital was opened—namely, the National Orthopædic Hospital, which was built on the now familiar site in Great Portland Street. In 1905 these three hospitals amalgamated to form the Royal National Orthopædic Hospital In 1922 the hospital bought the Mary Wardell Home at Stanmore, and thus became its country branch. At first there were only thirty-four beds and all the work, operating and radiography, was done in the rooms of a Victorian country house. But the growth of the hospital has been phenomenal. There is now accommodation for 276 patients with a convalescent block for another 44, and a training college for 112 boys handicapped by some permanent crippling defect. With this rapid growth came the necessity for enlarging the facilities for physical treatment, and particularly for the victims of poliomyelitis who have been admitted in increasing numbers during recent years. The provision of a pool for under-water remedial exercises was considered essential; such pools exist in a number of hospitals in this country and have long been a feature of orthopædic hospitals in the United States and Scandinavia where poliomyelitis is a constant and serious problem. Their essential features are that they shall contain warm water and be easy to manage. The pool at Stanmore has been designed to make the task of the masseuses as light as possible The sides of the pool come well above floor-level, and there is a central deep trough for adult patients, and two bays for the treatment of infants. The corners of the bays are indented so that the masseuse can lean over the child without undue discomfort. The capacity of the pool is approximately 2500 gallons, the temperature of the water is maintained at 90° F. by thermostatic control, the circulation is continuous, and the water is filtered and treated with alum. Adjoining the pool are cubicles where patients may be sprayed with hot or cold water, dried, and given massage and exercises



R Fox

The pool for under-water remedial exercises

R Fox

The new treatment block

The block has cost £17,000 A donation of £5000 from the executors of the late Caleb Diplock enabled the work to be commenced It was their wish that the money should be devoted primarily to the construction of the swimming pool, and the committee of management decided at the same time to erect a larger building for all the departments dealing with physical treatment, though this has meant waiting until other funds became available

The other features of the treatment block are a large gymnasium which can also be used as a lecture-room, a light treatment room containing Hanovia lamps, a large massage room more than sufficient for the present needs of the hospital, a dental room (dentistry is an important part of treatment in long-stay cases), and a small lecture room which is also used as a pathological museum On the first floor is a large central linen room sufficient to contain the linen for the whole hospital There are over three hundred cupboards and each is aired by warm water circulating through pipes placed between adjoining cupboards, there is also a blanket store, sorting and receiving rooms

GRAINS AND SCRUPLES

Under this heading appear week by week the unfettered thoughts of doctors in various occupations Each contributor is responsible for the section for a month, his name can be seen later in the half-yearly index

FROM A WOMAN PUBLIC HEALTH OFFICER

V

Some time ago I met what is technically known as a Lovely at a hen party The fact that it was a hen-party alone explains why the much photographed and paragraphed beauty confided in the likes o' me She had it appeared been electioneering for a boy friend with disastrous results "The Reds in that neighbourhood," she complained, "are a dreadful set They have secret meetings where they practise making up difficult questions to catch us, and anyone who makes up a question that *no one* can answer gets half a crown"

Even more successful than the Reds at this nefarious game, in my estimation, are the Young, especially the Young who are confronted prematurely by the great issues of birth or death On several occasions non medical parents, after introducing their offspring to the simple facts of reproduction, have offspring to the simple facts of reproduction, have referred them to me for the answer to any rashly referred them to me for the answer to any supplementary questions (in the parliamentary sense) Here are some of the queries—*ipissima verba*

From a little girl of 6 "How does God know for certain that a lady would be kind to a baby and really wants to have one? Of course He would never send a baby to a lady if she *didn't* want one, would He?"

From a small boy, just under 7 "Mummy says the muscle in the womb is like the muscle of the heart and acts without us telling it to Then how does the womb *know* when a baby is ready to come out and meet its Daddy?"

From another boy aged 7 "Mummy told me all about the way babies come but there is one thing I don't understand It sounds awfully uncomfortable Why do ladies do it?"

Can you blame me if I remembered with gratitude the base tactics of the Reds? Each child was hurriedly dispatched to the nearest Woolworth's—with a well earned half crown

* * *

High in the list of unanswerable questions pro pounded by those of riper years one would place the professional conundrum so often discussed in these columns full time service or private practice? Most of the writers seem to take the same view of full time service that Calvin Coolidge a preacher did of sin On the whole they are against it It would sometimes be easier to agree with their conclusions if they did not state their reasons Public medical services only exist because the country has found that certain things it wants are better supplied by communal effort So long as they were left to private enterprise they were either not done at all, or were badly or inadequately done That is a matter of medical history It does not logically follow however that the whole of medical practice would be better conducted by whole time officers Surely this is a purely empirical question to be settled by careful testing and experiment item by item, rather than by the doctrinaire pronouncements one hears from either side

As for the effect on the life of the doctor himself of whole time or private practice, it is difficult for me, as an Irish politician once said, to be either partial or impartial in this dispute Life is a series of compromises and we have all to decide which of the modes of life open to us will enable us to live nearest to our desire "Take what you like—and pay, says God" For many, a full time public service really does enable them to do the sort of things they want most, and at no heavier payment than any other choice would exact Probably the true reasons why one decided as one did are known only to our Creator and our Analyst (if any) and it is not necessary to pretend here that such reasons are always altruistic I can remember a fellow student at the Rotunda who was overheard lamenting to his mates that a constitutional dislike for leaving his bed left him with no alternative but to become a (?) M O H or marry a woman doctor who would take the night calls Sometimes however Youth is genuinely moved by an irresistible impulse towards what American health literature pompously calls Human Betterment, but may be more modestly described as tidying up the grosser muddles humanity has made for itself, such as slums or venereal disease It is even alleged that men have been drawn into the public service by a strange passion for statistics, satiable in no other way Or again by lazily taking the first chance that offers and without conscious plan at all

* * *

But having rightly or wrongly made the choice, what of the payment? "You surrender clinical interests," says one critic, but he is obviously out of date, for a state or municipal service may nowadays provide unrivalled chances for developing purely clinical or scientific bents—"You become callous and lose touch with the individual," says another Do we? Administrative work consists largely in seeing that obscure and helpless people get a fair deal, and in securing the rights of individuals who hardly know they possess them And if the critics think that they can do work under public bodies at clinics or hospitals and neglect the interests of the patients they had better not come and try—"You surrender

your freedom," says the voice that penetrates most clearly. Unlike the millions of our fellow human beings who inhabit the totalitarian states (and the few thousands whom I saw prostrating themselves in the Earls Court stadium one Sunday) we still consider that a reproach. My generation of youth believed that Freedom was a thing to die for and not a thing to trade for a coloured shirt. I am inclined to believe that British youth thinks so still It is altogether wholesome that there should be a dread of a slave status in any branch of the medical profession.

How far is the fear justified? Members of a highly organised profession must from the moment they register as students with the General Medical Council suffer restrictions on their liberty of action for the common good. Nor do the fetters fall off when one is qualified. I have no desire to emulate the author of "The Citadel," but do general practitioners —the chosen guardians of British liberty—never have to compromise to keep their patients and their appointments? As for the specialist, when we in the health services watch him staggering along the rolling English road to Harley Street via the voluntary hospitals, are we not sometimes moved to almost pharisaical thankfulness for our own lot?

* * *

Having decided, as we surely must, that every branch of medicine has its own perils, let us admit handsomely that the production of the yes-man is the great occupational risk of a full-time service. One knows how it begins A friend once told me that she could do no research in her school medical work, could not even become properly acquainted with local conditions, or follow individual cases. In her county the assistant school medical officer's duties were regulated by a clerk whose whole idea was to keep down travelling expenses. None of them ever protested . . . after one man had been sacked for doing so. If in subordinate ranks yes-man-ship leads to a wicked waste of opportunity, in the higher ranks it becomes a public menace There is no-one competent and available to do a big job when it is required, perhaps for the *national safety*, and the lay administrator is hoist with his own petard

An unpleasant variant of the yes-man is the official who adopts what has been described as the "racing-cyclist attitude." His back is bent to his superiors and his feet are busy treading down those below, and *sometimes* (in an ill-managed service) he may go far and fast. As we all recognise, the Jabberwock of whom we must beware is the Lay Administrator who would in time kill any service There is no reason why he should be given the chance. "What has that fellow got we haven't got?" is a fair question to ask, and we've got any amount of relevant knowledge and experience that he hasn't

* * *

What is the fundamental secret of this freedom? One of the Fathers of the Church has said that it is to learn such subordination of the senses to the spirit that one is able to act as one believes to be right on any issue and at any time. I recalled this definition vividly at the finest moving-picture I have ever seen—Paul Muni's Zola. On each of my three visits the audience thrilled to this abstract idea as I have never seen them moved by a love scene. You will remember that Zola who had known years of privation and fought his grim battles with entrenched privilege has won through to ease and honour And now comes a call to surrender everything and start all the battles over again, but equipped now with the tired body and brain of old-age instead of the urgent vigour of youth. He could respond as he did because he had never become a slave to his own success. That is the real freedom—and to this humble observer it appears as a rare treasure of the human spirit, hard to win and hard to retain whatever one's path in life.

Now I get back on the fence again—no doubt to the relief of the spectators—with an added respect for those who came before and greetings to those who come after.

Next month Doctor Don will be responsible for these columns.

INFECTIOUS DISEASE

IN ENGLAND AND WALES DURING THE WEEK ENDED JULY 15, 1939

Notifications.—The following cases of infectious disease were notified during the week: Smallpox, 0; scarlet fever, 1838; diphtheria, 836; enteric fever, 23 (51 "expected"); pneumonia (primary or influenzal), 508; puerperal pyrexia, 192; cerebrospinal fever, 33; acute poliomyelitis, 16; encephalitis lethargica, 1; dysentery, 32; ophthalmia neonatorum, 112. No case of cholera, plague or typhus fever was notified during the week.

The number of cases in the Infectious Hospitals of the London County Council on July 21 was 2900, which included. Scarlet fever, 777, diphtheria, 458 (carriers, 18), measles, 22, whooping-cough, 753; puerperal fever, 16 mothers (plus 8 babies), encephalitis lethargica, 306, poliomyelitis, 7 At St Margaret's Hospital there were 23 babies (plus 10 mothers) with ophthalmia neonatorum

Deaths—In 126 great towns, including London, there was no death from smallpox or enteric fever, 4 (0) from measles, 2 (0) from scarlet fever, 14 (3) from whooping-cough, 9 (0) from diphtheria, 26 (9) from diarrhœa and enteritis under two years, and 5 (1) from influenza. The figures in parentheses are those for *London itself*.

Manchester reported 3 deaths from whooping-cough Fatal cases of diphtheria were scattered over 7 great towns, Manchester reporting 3

The number of stillbirths notified during the week was 245 (corresponding to a rate of 37 per 1000 total births), including 41 in London.

THE LANCET 100 YEARS AGO

July 27, 1839, p. 650.

From a lecture at the Metropolitan Free Hospital by Mr P. Bennett Lucas.

Of the several ulcerations to which the tongue is liable, none are more likely to be confounded with each other than the cancerous and venereal, and this arises from the hardness which accompanies both; the hardness of the cancerous ulcer in this situation, as when situate in any other organ of the body, is, however, of the stony kind, whilst that of the venereal ulcer is more of the cartilaginous hardness, in the cancerous ulcer, also, the surface is very irregular, and presents granulations in one part, and in another a sloughy appearance, whilst the venereal ulcer is much less irregular, and presents the same kind of appearance for its whole extent There are other symptoms in both these diseases of the tongue which will guide us in forming a correct diagnosis; of these the occasional darting pain which accompanies the cancerous sore, and the rapid extension of the ulceration, when contrasted with the comparatively stationary condition and slighter irritation caused by the venereal ulcer, are very *characteristic*. The history of the symptoms which preceded the venereal ulceration, the presence of other venereal symptoms, together with the salutary influence which the exhibition of mercury almost *immediately* exercises over the venereal sore, are the most unequivocal guides to the surgeon

LETTERS TO THE EDITOR

DISTURBANCE OF MEMORY AFTER CONVULSION TREATMENT

SIR,—*Having read with great interest* the article by Drs G Tooth and J M Blackburn, in your issue of July 1, we should like to point out that we have been working on the same subject and our article was published in full in the *Zeitschrift fur das gesamte Neurologie und Psychiatrie* 1939, 166, No 1

We append a short summary of our results We in the Budapest University Hospital for Mental and Nervous Diseases followed up 1–4 years after treatment 419 cases of schizophrenia, comparing the cases actively treated with those not actively treated or treated by other methods We examined after treatment 85 cases with insulin, 50 with Cardiazol (Tetracor), and 132 cases which did not undergo active treatment The results may be thus briefly summarised

In the cardiazol group we had 23 8 per cent full and good remissions examined after treatment, in the insulin group 30 6 per cent, and in the untreated group 35 per cent Thus later examination showed that better results were obtained in the untreated group If we consider separately those later remissions which occurred more than 6 weeks after the treatment had been stopped and those which could not directly be ascribed to the active treatment, the actual figures for cardiazol are 13 per cent and for insulin 15 per cent

We must confess that these results are very depressing, the number of recoveries observed by us being no larger than before the introduction of cardiazol therapy

We are, Sir, yours faithfully,

LENOCZKY, HORÁNYI,
FSZENYI, BAK

Budapest Istenhegyi ut, 4/F, July 20

TRANSFUSION SYPHILIS

SIR,—There was a suggestion in your issue of July 15 (p 170) that there are many more cases of syphilis insontium than are revealed and a recent syphilis insontium than are revealed and a recent example was quoted of the conveyance of infection by blood transfusion An annotation of the same date in a contemporary[1] mentions the risk of syphilis being transferred from an infected donor to a healthy recipient That risk is a very real one, and, as far as can be ascertained, there are few blood-transfusion empanelling centres in which examination of volunteer donors for syphilis is carried out as a routine In a recent letter to the public press[2] Lord Dawson states "All that is required of volunteers now is a few drops of blood to enable a grouping test to be made" That, however, is not nearly enough At the time the grouping test is done the volunteer should undergo a thorough clinical examination by a syphilologist and a specimen of blood should be submitted to the Wassermann and Kahn tests Only after these investigations have yielded negative results in respect of syphilis should the volunteer be placed upon the list of *potential* donors Positive clinical or serological findings would exclude the volunteer as a blood donor When the time comes for any volunteer on the list to provide a specimen either for immediate transfusion or for storage, there should again be carried out a clinical and serological examination before the specimen is used

Since 1915 the following authors have reported cases of transfusion syphilis —

(1) Fordyce J A *Amer J med Sci.* 1915, 149, 781, (2) Bernheim, B M., "Blood Transfusion" London, 1917, p 62 (3) Brem, W V., *J Amer med Ass* 1923, 81, 852 (3 cases) (4) Spillman L and Morel V., *Bull Soc franç Derm. Syph* 1926 33 453 (5) Levy, I I and Ginsburg L, *Amer J Syph* 1927, 11 447 (6) Feldman, V., *Rev franç Derm Vénéreol* 1928, 4, 341 (7) Dufour, H., *Bull Soc méd Hôp Paris* 1929, 45 511 (8) Tzanck, A., *Ibid* Marshal, A., *Ibid* (9) Schuimann, L., *Prof méd franç* 1929, 3, 393 (10) Constantinescon E and Vatamann, N *Ann. Mal vénér* 1929 24 161 (11) Aubertin C and Fleury, J., *Bull. Soc méd Hôp Paris* 1930, 54 69 (12) Gougerot H et al *Ann Mal vénér* 1931, 26 174 (3 cases) (13) Polayes, S H and Lederer M, *Amer J Syph* 1931 15, 72 (14) Cordiviola, L A., *Sem méd* 1932 39 45 (15) Pinard M and Robert P, *Bull Soc méd Hôp Paris*, 1932 48 214 (16) Post, C D, and Cooney, G C *J Amer. med Ass* 1933, 100, 258 (17) Cummer C L, *Amer J med Sci* 1933 185, 787 (2 cases) (18) Williamson, G R, and Strong, R A., *Amer J Syph.* 1933 17 484 (19) Minami S and Asabi Fukuoka, *Derm Urol* 1933, 1, 27 (20) Moore, J E *Modern Treatment of Syphilis* Springfield 1933, p 456 (3 cases) (21) Pinard, M., *Bull Soc méd Hôp Paris* 1934 50 416 (3 cases), (22) Carnot et al, quoted in *J Amer med Ass* 1934 101 1773 (23) Garner V *Arch Derm Syph Wien*, 1934 30 480 (24) Jones, H W et al *Amer J Syph* 1935 39, 39 (4 cases) (25) Morgan, H J, *Amer J med Sci* 1935, 189, 808 (26) Perin, M L, and Lefevre, M *Bull Soc franç Derm Syph* 1935, 42, 954 (27) Mandelbaum, H and Saperstein A N *J Amer med Ass* 1936 106 1061 (28) Pautrier, L M *Bull Soc franç Derm Syph* 1936 43 503 (29) Klauder, J V and Butterworth T, *Amer J Syph* 1937 21, 652, (30) Rein C R, et al *J Amer med Ass* 1938, 110, 13

This gives a total of over 40 cases of transfusion syphilis occurring under peace time conditions, and probably a great many more instances have occurred but have not been diagnosed as such It is obvious that if, as Lord Dawson states, one out of every ten persons wounded in air raids requires blood-transfusion, the danger under war time conditions will be much greater unless measures are taken to eliminate syphilitic donors In most instances it would appear that the donors causing transfusion syphilis were in the latent phase of the disease and were unaware of their infection In some instances the donors were serologically negative, being in the pre chancre or incubation stage of syphilis

There are certain points to which I would particularly direct attention —

(1) The positive Wassermann test will detect only the most obvious risks of infection

(2) The presumptive precipitation test such as the Kahn should be the test of choice since it is more sensitive and more easily and quickly applied than the Wassermann in emergency

(3) A thorough physical examination, carried out by an experienced syphilologist, should be done on every donor before being put on the list and again before a specimen is taken for storage or immediate transfusion, in addition to a Wassermann and/or presumptive Kahn test

(4) Clinical examinations and serological tests done at intervals are valueless

(5) Donors should be carefully selected from persons of the highest moral and of satisfactory social status in order to minimise as far as possible the use of blood from a person in the incubation period of syphilis

In the annotation already mentioned it is stated "In any event, the risk (of syphilis) is borne by the recipient and not the donor" There are, however, several cases on record where the donor has been infected by the recipient owing to cannulas being inadvertently exchanged, and to other errors of technique With stored blood this danger ceases to exist but in all direct transfusions carried out in normal times for conditions such as haemorrhage or aplastic anaemia, the donor ought to be as well assured

1 *Brit med J* July 15 1939, p 121
2 *Daily Telegraph and Morning Post*, July 6 1939

of protection against accidental syphilis as is the recipient.

It would be interesting to have the medicolegal position with regard to these matters authoritatively clarified.

I am, Sir, yours faithfully,

E. T BURKE,
July 18 Director, L C C (Whitechapel) Clinic

*** Colonel Burke raises points of obvious interest and importance at a time when the possibility of blood-transfusions on the largest scale has to be envisaged They show, however, only one side of the picture, and perhaps overemphasise it. No person in imminent risk of death from hæmorrhage would hesitate to accept the very slight risk of infection, with syphilis or with any other infective disease, involved in a blood-transfusion, nor would any medical man hesitate to take that risk on his or her behalf That this risk should be reduced to a minimum all would agree, and Colonel Burke's letter is particularly valuable in emphasising that an adequate clinical examination, and a Kahn test, at *the time the blood is taken for storage or administration*, are a better safeguard than similar tests carried out weeks or months before, when a donor is enrolled. So far as an emergency permits we have no doubt that all possible precautions will be taken Any risk to the donor, as Colonel Burke is careful to point out, ceases to exist when, as in the present emergency scheme, all blood is taken into bottles for storage, or for indirect administration —ED. L

ORTHOPTICS

SIR,—In your report (July 15, p 135) of the Oxford Ophthalmological Congress I was not surprised to learn that members were divided in their opinions about the value of orthoptic training for heterophoria. I was, when in practice, well satisfied with the result of the treatment I adopted for this condition and very rarely had to resort to operation It is most important that treatment should commence as early as possible—this is much more easily done now that child welfare and municipal eye clinics are the rule.

After retinoscopy under atropine glasses are prescribed in all cases. These glasses should be worn constantly, not only during the day but at night as well I have never known a child having received any injury from this Young children generally awake much earlier than their nurses or parents and they pass this time with all kinds of ocular exercises If a squint already exists it is necessary to prevent amblyopia developing. The occlusion of the fixing eye is irritating to the child and can better be done by slightly smearing with vaseline or butter the lens of the fixing eye, taking care that the lens of the squinting eye is meticulously clean After instruction and explanation the mother or nurse carries this out A month or so of this treatment will soon improve the vision of the squinting eye; of course the vision of the fixing eye will suffer to some extent, but by alternating this treatment the equal development of each eye can be assured and the vision the same If with correction both eyes come to normal then the ordinary games and occupations will develop as much fusion sense as they are likely to get The strabismus disappears gradually, only to appear at times of mental excitement or bodily disorder.

I am, Sir, yours faithfully,

G. AUBREY JELLY.
Lytham, Lancs, July 20.

THE VACCINATION OF QUEEN VICTORIA

SIR,—In the note on Jenner as Royal Physician on p. 170 of your issue of July 15 you state that the vaccination of Queen Victoria in 1819 cannot be traced to him. Actually this vaccination was done by T. J Pettigrew, and is described in his Medical Portrait Gallery, vol iv, section Pettigrew, p. 15, as follows:—

"Upon the birth of the Princess Victoria, His Royal Highness (the Duke of Kent) was pleased to entrust to me, in conjunction with his domestic physician, Dr. (now Sir Isaac) Wilson, my old and much esteemed friend, the selection of a proper subject from whom the vaccine lymph for the inoculation of the Princess was to be obtained. This honour was conferred on one of the children of the late John Elliot, Esq., of Pimlico, who married a daughter of my dear friend, Dr Lettsom. I attended at Kensington Palace, and there vaccinated her present Majesty, to the entire satisfaction of her illustrious parents"

Vaccination, it should be remembered, in those days was from arm to arm, and it was extremely important that the child from whom it was taken should be free from hereditary disease That is why Dr Lettsom's grandson, Edmund Elliot, was chosen He died a lieutenant in the Madras Infantry in 1841, and there is a portrait of him on p 472 of my "Life of Lettsom" John Lettsom Elliot (1804–98), an elder brother of Edmund Elliot, held the infant princess in his arms when she was being inoculated from his baby-brother, and he was in the habit of describing this episode in his old age occasionally at the Athenæum, of which he was for years the last surviving original member. There is a wax medallion of him by Lucas preserved in the library of the club

The story of the vaccination was retold to Queen Victoria about the time of the Diamond Jubilee She was most interested, and it was arranged by Sir Lionel Cust that she and Lettsom Elliot should meet But nothing came of it. They were both too old and feeble by then.

I am, Sir, yours faithfully,

J. JOHNSTON ABRAHAM
Queen Anne Street, W 1, July 24

TRANSMEATAL ATTICOTOMY

SIR,—Mr. Tumarkin, in his article in your last issue (p. 189), is in error in saying that his operation of transmeatal atticotomy has apparently never been performed in England, although no doubt his assertion is made in all good faith. More than thirty years ago, when the old operation of ossiculectomy was becoming obsolete, I performed from time to time, in selected cases and with excellent results, an operation entailing the removal *per meatam* of the outer attic wall to drain the attic and allow of the removal of any granulation tissue present. It became clear to me that this comparatively simple procedure would in many cases save patients from the more serious radical mastoid operation and, in addition, ensure better preservation of hearing From that time onwards I have performed the operation in suitable cases, and it should in my opinion be deemed the operation of selection.

Mr Tumarkin may, with reason, ask why I have never published my results, and I once had a friendly argument upon this question with my friend Dan McKenzie My reason for silence was that a clinical assistant at the Royal Ear Hospital, whose experience was less than three months, essayed to perform the

operation, without consulting me, on a patient of his own He succeeded in dislocating the ossicles and injuring the facial nerve After this untoward event I decided it would be better not to publish any description of the operation, but to impart it only to those who could be trusted to perform it safely

I am, Sir, yours faithfully,

Harley Street, W 1, July 21 MACLEOD YEARSLEY

INSULIN RESISTANCE

SIR,—The problem of "insulin resistance" attracted attention almost as soon as insulin came into general use The term is not, unfortunately, well defined and may on the one hand be employed to include cases such as that of R ot in which the patient died in coma though taking 1686 units of insulin a day, and on the other the relatively resistant cases which are a commonplace of daily practice It is also applied to the transient resistance encountered in infections and to the resistance met with in thyrotoxicosis and acromegaly We presume that Professor Himsworth, in his last Goulstonian lecture, is dealing with the relative resistance to insulin shown by a large proportion of unselected diabetic patients

Himsworth states that in the diabetics the insulin sensitive and insulin resistant case are clearly differentiated by his insulin glucose test, and do not merge into each other This has not been our own experience Using the insulin glucose test, we have found every gradation from sensitive to resistant There is no reason to believe as Himsworth suggests, that this is due to infrequent blood sampling Two samples taken half and one hour after administration of glucose and insulin, the period during which the difference between the groups is stated by Himsworth to be most marked, should obviously suffice to determine the general direction of the curve and to differentiate, if this is possible, two clearly demarcated types This is obvious from the curves given by Himsworth himself Though in some diabetics insulin resistance may be permanent, we have shown that in others insulin resistance, as determined by the insulin glucose test, is purely transitory and may be converted by suitable dietetic measures to insulin sensitivity

Himsworth believes that the difference between the two types under the conditions of the test lies in the inability of the peripheral tissues of the insulin resistant diabetic to remove sugar from the blood, insulin sensitive subjects, on the other hand, showing a marked arteriovenous blood sugar difference He misinterprets the work of one of us when he states that he (W J G) found a difference in the peripheral insulin effect in the two types of sufficient magnitude to afford support for this contention Actually no significant indication of a difference in the peripheral response was found, and it was this fact that led us to conclude that the cause of the difference in the arterial blood sugar curves of the two groups in the insulin glucose test was to be sought for centrally—that is, in the liver storage

We are Sir, yours faithfully,

O L V DE WESSELOW,
W J GRIFFITHS

PARLIAMENTARY INTELLIGENCE

ON THE FLOOR OF THE HOUSE

By MEDICUS M P

THE decision of the Special Commissioners for Income tax that the sick pay of a member of a sickness annuity and life assurance society and of the Dentists Provident Society was assessable to income tax has already been the subject of a statement in Parliament by Sir John Simon Chancellor of the Exchequer Last week further questions were asked, but as the decision is now the subject of an appeal its implications were not fully dealt with The matter is one of interest not only to members of the medical and dental professions, although the decision was given in the case of a gentleman qualified as both doctor and dentist and practising as a dentist, but to every person who draws sick pay The decision on appeal must be awaited before further comment is made, but the facts of the case are interesting

The gentleman concerned originally joined a friendly society registered under the Friendly Societies Acts which at a later date became a company but continued to insure its members for sickness benefit on the same terms as those originally agreed The Dentists Provident Society to which the same gentleman also belonged has always been a registered friendly society In both cases the right of a member to receive sickness benefit depends on the continuance of the payment of subscriptions by way of premiums The member concerned has drawn sickness benefit since January, 1931, when he was incapacitated from following his profession as the result of an accident Each year since that time the member has returned a statement of his income to the Inland Revenue authorities and has included each year the amount of sick pay he received from both sources In October, 1938, the member for the first time received an assessment under Schedule D on this sick pay which was described as follows "From profits of trade &c of—Pensions" In November, 1938, the member received notices of assessment under Schedule D for each of the six years 1932–33 to 1937–38 inclusive

If the decision is upheld on appeal it will presumably apply to any sick pay for any period

* * *

Another matter which is now being considered just behind the parliamentary stage—by parliamentary advisers of some of the most important local authorities—is that of the conditions under which children are kept when "minded" for the day The child minded for the day is, of course, quite distinct from the foster child, whose interests are safeguarded by the child life protection clauses (in London) of the Public Health (London) Act of 1936 There is no obligation on the part of those minding children by the day to notify the fact that they do so, it is in consequence not possible to state how many of such minders there are nor under what conditions children are minded But some bad cases are known It is hardly likely that the total of minded children is less than half the number of foster children and there may be many more than that

The new parliamentary secretary to the Ministry

of Health is Miss Horsbrugh, who is known to be interested in this problem and it is to be hoped that she will activate this and other questions concerned with the health of women and children. Such activities are always welcomed by Parliament and Miss Horsbrugh has all-round good wishes in her new work.

* * *

Most of the parliamentary week has been taken up with war-risk insurance and kindred subjects related to the present disturbed international situation. But on Friday the Opposition had chosen the Home Office vote so that the matter of juvenile labour could be considered. The debate revealed the fact that there are still about half a million juvenile workers under 16 in factory employment. Of these there were 44,000 in trades connected with the cotton industry, where exemptions had been given by the Government for the children concerned to work forty-eight hours a week and 29,000 in the printing and book-binding trade for forty-five hours a week, the week in the last case being one of five days of nine hours each. The rest of the children will work forty-four hours a week. There was a curious far-off echo of ancient debates on the employment of infants in the cotton mills at the time of the industrial revolution. One member supporting the longer hours for children said that work in the cotton industry was found "particularly suitable for them Their employment in this work would help to train them and lead them into adult employment" Practically no one else took this view. Lady Astor asked: "Do you really suggest that the cotton industry cannot just as well engage children of 16 as children of 15?" Mrs Tate said that "if the welfare of an industry depended on the overworking of children the sooner it was wound up the better." Mr Wakefield said that cases of young people being employed for long hours were far too numerous. "The work of fitness and youth organisations," he said, "was being steadily interfered with because young people were too tired when they arrived at their clubs" Mr Tomlinson, the Labour M P. for Farnworth, said his father went into a cotton mill at 8 years of age, and he looked back himself to the days when "he attempted to find his way on the arm of his father, finishing his sleep as he went through the fields," to the factory, and wondered how people could manufacture a phrase and describe this as "beneficial employment"

The undesirability of long hours for girls of 14—the future mothers of the nation—and of spending large sums on education wasted by children going into industry too young, and many allied matters, were raised by speaker after speaker Fitness and health have become political questions of parliamentary importance. The House evidently agreed with Mr. Ridley when he said that they were dealing with children and should "completely disapprove of conditions for other peoples' children which they would not tolerate for their own"

Behind the fog of war, or rather of war measures in Parliament, an opinion is shaping which is ready for an extension of improved conditions at both ends of the wage-scale A raising of the age of entrance into industry would take many young people off the labour market, and an increase in old-age pensions, which has become a very live issue and on which Parliament debates this week, would take some more off at the other end.

Despite the Dictators things move.

FROM THE PRESS GALLERY

The Milk Industry

IN the House of Lords on July 21 the Earl of FEVERSHAM, parliamentary secretary to the Ministry of Agriculture, moved the second reading of the Milk Industry (No. 2) Bill, which has already passed through the House of Commons. Although this bill was necessarily limited in scope it was, he said, a further contribution to the main objective of milk policy—to increase the consumption of milk. Steps were being taken by the Government to secure that the greatest possible advantage was taken of the milk-in-schools schemes. As regards mothers and young children, although a scheme was introduced by the Scottish Milk Marketing Board early this year, it had not been possible to begin such a scheme in England, but agreement had been reached within the last few days with the English Milk Marketing Board as to the financial basis for such a scheme, and the board would submit a scheme at an early date This would provide for the supply of milk to local authorities for maternity and child-welfare purposes at 2*d* a pint, or 1*s*. 4*d*. a gallon, little more than half the ordinary retail price.

The development of the scheme would depend on the initiative shown by local authorities, and on the response of the mothers and children. It would be for the local authorities to prepare their proposals and submit them for the approval of the Ministry of Health. They would be able to authorise the supply of milk to the consumer free, for part payment, or at the reduced price of 2*d*. a pint The balance of the cost of any milk supplied at less than 2*d*. a pint would fall on local authorities' funds. The Exchequer grant until the end of September, 1940, would be sufficient to bring the board's returns on milk supplied under the scheme up to an average of 1*s*. 2*d*. a gallon on the year. The rate of any grant for the future would be reviewed before the end of September, 1940, in the light of the experience gained. It was proposed that the distributive margin on milk sold under the scheme should be not more than 8*d*. per gallon

The bill could, of course, only be regarded as an interim measure. Nevertheless, it provided for improvement in the quality of the milk-supply, which was an essential feature of a policy directed towards increasing milk consumption. The objective of permanent milk policy must be a self-supporting milk industry, assisted only so far as might be necessary to prevent the price structure from being undermined by competition from overseas.

The Earl of ONSLOW, Chairman of Committees, recalled the outbreak of typhoid on the south coast three years ago. He said that the corporation of Poole, very properly desiring to extend every protection to their inhabitants and visitors, brought in a clause in their general bill dealing with pasteurisation of milk. In the same session quite a different scheme was brought in by Glasgow. After some controversy the Government through Lord Halifax expressed the view that pasteurisation would be more properly dealt with in general rather than in local legislation. Lord Halifax had added that it was the intention of the Government to bring forward long-term legislation dealing with general milk policy in the near future. On that announcement the Poole clause was withdrawn and Glasgow dropped their bill That speech of Lord Halifax was made in April, 1937, but it was not until this spring that the first Milk Bill was introduced in the House of Commons. That bill included provision for pasteurisation, but the measure had had to be dropped and the present bill was only of an interim character. Lord Onslow asked what the Government's attitude would be if a local authority brought forward a private bill for next session dealing with pasteurisation on lines similar to those of the Poole and Glasgow bills

Lord LUKE said that the milk-control schemes had served a useful purpose, but hospitals had suffered

severely from them The cost of milk at the higher price they paid today as compared with 1932–33—the year before the milk control came into being—meant an expense of about £115,000 more per annum to the hospitals A hospital with 500 beds required at least 100 gallons of milk a day At present prices a quarter of the total cost of hospital provisions was for milk. The quantity of milk supplied to the hospitals was 7,000,000 gallons per annum out of a total of 1,100,000,000 gallons—under a 150th part of the whole milk scheme He was not asking for milk for the hospitals at the low price that butter manufacturers paid, but that the price should be reduced to what it was before 1932 Hospitals were not business concerns, and they could not raise their prices

The Earl of FEVERSHAM in reply said that the proportion of accredited and T T milk on the market was now 40 per cent of the total. Attested herds were producing over 50,000 000 gallons a year He agreed that if it was considered as a long term measure this bill would not be a satisfactory solution of the problems that confronted the milk industry There was no more justification for the provision of milk at specially cheap rates with Exchequer assistance to hospitals than for the provision of other essential requirements, such as gas, coal, electricity, bedding and medicine The fact that hospitals were doing beneficent work was surely not a reason why producers of milk should give them preferential treatment to the extent of selling milk at an unremunerative price The Milk Marketing Board had already granted such concessions as they usefully could. The question of pasteurisation was clearly unsuitable to be dealt with in a short-term bill of this kind, and he could not give any statement of the Government's view on the general question It was open to local authorities to promote private bills containing pasteurisation provisions and if they did so the Government would consider such provisions on their merits

Working Hours of Young People

In the House of Commons on July 21 a debate took place on the Home Office vote on the hours of employment of juvenile labour Mr RIDLEY said we moved with leaden feet in this matter With all the tremendous advances in technical productivity the most that could be done was to think of an eight-hour day for children of fourteen Conditions were permitted that required children of fourteen to rise at 5 45 in the morning when still overcome with sleep He had a youngster of that age, and for all the money in the world he would not permit that child to engage in a process of running its health by compelling it to wake up for arduous work winter and summer at that hour By the regulations the Home Secretary was depriving 38,000 young people of sleep and recreation They were too tired at the end of a day's work to cycle or swim What part could such young folk play in the national keep fit campaign?

Sir CYRIL ENTWISTLE said that there were many factors in the question of the employment of young persons Costs of production were important if an industry was to survive A committee which spent five days hearing all the evidence put before it was satisfied that the processes on which young persons were employed in the cotton industry were not injurious to their health It was true that no employment in a factory could be good for anyone, adult or young person, everyone would be better if they spent all their time in the open air All these matters were, of course, relative, but it was found that the processes on which these young persons were employed were not arduous in the sense of being heavy manual labour or imposing a strain on them—Mr TOMLINSON said he himself went into a cotton mill at eleven years of age / If it was prejudicial for children to work 44 hours it was prejudicial for them to work 48 hours It was all a question of degree of prejudice One did not say that because a man had been poisoned for 23 minutes but would die in 25 minutes therefore the poison was good for him for 23 minutes—Viscountess ASTOR said there must be something radically wrong with an industry if it depended on children of fourteen working 48 hours a week If she had gone into a cotton mill at eleven years of age, or a child of hers had done so, the Red Flag would not have been red enough for her Of all the countries in the world we ought to look after our juveniles in view of our falling birth-rate—Mrs TATE said the girls who were going into industry at fourteen were the future mothers of the nation Whether they were going to be perfect for motherhood depended perhaps more than anything else on how they were treated between the ages of twelve and eighteen—Mr SEXTON suggested that a major factor in the reduction of accidents was the increased age of entry into industry, and that was a powerful argument for keeping children at school until they were fifteen—Mr MACQUISTEN said that 8 hours a day was too long for young people to work, and the half time system would be much better for them The foundation of national welfare was a healthy well-paid population, and people must not be overworked The Home Secretary should reconsider these regulations—Mr COVE said that if he liked the Home Secretary could take a strong line on this question and say with the backing of the House of Commons that 44 hours was the maximum time which these children ought to work.—Mr WAKEFIELD said that the work of fitness and youth organisations was being steadily interfered with because young people were too tired when they arrived at their clubs We ought to see to it that our young people were given reasonable opportunities after their hours of work of building up their mental qualities, developing their physique, and being able to play games and continue their education

Mr RICKARDS, speaking as managing director of various textile firms, said that if these regulations were passed they would not make 1 per cent difference to the young people going into the industry What was damaging Lancashire far more was the malnutrition consequent upon low wages, and the main reason for that was foreign competition

Mr PEAKE, under-secretary, Home Office, replying to the debate, claimed that the legislation passed since 1933 showed that the Government was not unsympathetic to the claims of juvenile workers It could not be said that certain industries had made use of the rights given to them by Parliament to claim exemption under section 71 of the 1937 act in regard to the employment of young persons for 48 hours a week An industry had to pass through a very narrow mesh of conditions to secure that exemption In a large number of cases an inquiry had been refused because a prima-facie case was not made out Altogether about sixty representations had been made by relatively important bodies in respect of more or less distinguishable industries, and a considerable number from individual firms and smaller groups of employers There were three cases in which regulations had been recommended and had already been issued in draft These regulations provided that the longer hours should only apply to those who had reached fifteen years and upwards, except that those at present employed should continue in the present hours In two other cases the recommendation of the court had been in favour of making regulations and these would shortly be issued in draft In the case of one of these, the textile bleaching and dyeing industry the same provisions as to hours had been made In the other case, that of printing and bookbinding, the recommendation was that only one extra hour should be worked a week—45 in place of 44—by all juveniles under sixteen The number of young persons employed in the five industries in respect of which draft regulations had been made or were going to be issued was between the ages of fourteen and fifteen 29 000, and between fifteen and sixteen 44,000—a total of 73,000 That was out of a total of about 500 000 juvenile workers under sixteen in factory employment He claimed that the administration by the Home Office of section 71 of the act had been fair and judicial

QUESTION TIME

JULY 20–26

M. & B. 693

Dr. SUMMERSKILL asked the Minister of Health whether he would state the chief considerations which led him to refuse to allow the drug popularly known as M & B 693 to be generally used by medical practitioners for patients who were treated under the National Health Insurance Acts.—Mr. ELLIOT replied: It is not correct that I have refused to allow M & B. 693 to be used for the treatment of insured persons. Insured persons are entitled to this remedy in all cases in which practitioners responsible for their treatment consider that it is advisable. Prescriptions for M. & B. 693 have been given to insured persons ever since the drug came into use. I greatly deprecate the suggestion that permission to use this remedy has been refused, as it might lead to medical practitioners withholding it in cases where it would be of use. The suggestion may thus prejudice the chances of recovery of insured patients. No possible question even as to accounting can arise save in the small number of cases where the doctor receives a capitation fee for himself dispensing drugs, and then, if he considers that the cost of using this remedy is more than should be borne by his capitation fee receipts, he may apply to the Minister for sanction for a special payment. This also has been allowed in a number of cases.

Dr. SUMMERSKILL: Is it not a fact that the Minister was asked if he would put this drug on the special list of expensive drugs by the committee which deals with national health insurance work and that he said he could not allow that, but that in a year's time, when the price of the drug was reduced, he would reconsider it?—Mr. ELLIOT: No, the hon. lady has no right to say that at all. I have given the reasons for my answer. I say that this drug is available, always has been available, and always will be available for insured persons and the suggestions that it is not are totally unfounded and, what is more, dangerous to the health of the insured public.—Dr. SUMMERSKILL. I must protest. (Cries of "Order.") May I ask whether the Minister will give me a direct answer "Yes" or "No," whether he did not refuse to put this drug on the special list at the request of the British Medical Association, and is it not a fact that in the current issue of the journal of the British Medical Association there is a statement that the minister has refused to put it on the special list and will reconsider it in a year? Can I have an answer "Yes" or "No"?—Mr. ELLIOT. Certainly. I have refused to put it on the special list because it is obtainable under the ordinary arrangements for insured persons; and I have refused to put it on the special list because arrangements are made for dealing with these things separately. It is a matter of accountancy. The suggestion that this drug is withheld from insured persons is quite unworthy of the medical profession.

Dr. SUMMERSKILL asked whether the Minister was aware that manufacturing chemists possessed a monopoly of certain drugs, and by charging prohibitive prices prevented poor patients from receiving the most modern form of treatment, and whether, in the best interests of the community, he would take steps to remedy this.—Mr. ELLIOT replied: If the hon. member will give me particulars of the drugs which she has in mind, I shall be happy to look into the matter.

Dr. SUMMERSKILL. Is the Minister aware that the drug I have in mind is the drug I referred to in my last question, which he has refused to put on the special list, and which is being sold on the market at 7*s*. 6*d*. for 25 tablets, and because he has refused to put it on the special list it is being sold at a prohibitive price and is therefore unavailable for poor people?—Mr. ELLIOT. I think I have dealt pretty thoroughly with the hon. lady's suggestion, and I am perfectly willing to consider the question of these drugs if she will bring the facts to my notice. But, as I am informed, the actual cost of this drug is 4*d*. per dose, and not the figure which she gave.

Blood-transfusion Services

Mr. MANDER asked the Minister of Health whether the forms and other registration documents as used in the organisation of the emergency blood-transfusion services in the London area could be made available for the provinces, and whether, in order that the expense might not fall entirely upon voluntary organisations, financial and other assistance might be made available for the organisation of these services in the provinces as well as in London.—Mr. ELLIOT replied: I hope to be able to give some financial assistance, where necessary, towards the work of testing and registering blood donors in some of the main centres in the provinces. Forms and other registration documents similar to those used under the arrangements for London would be made available for the provinces.

Captain PLUGGE asked whether when the first supplies of transfused blood were exhausted additional supplies would be obtained on a similar system of bulk collection, or whether those registering for transmission would be required to travel to different parts of the metropolis or the provinces for the purpose of blood-transfusion.—Mr. ELLIOT replied: The arrangements which are now being made are for selecting and registering donors of blood, and these volunteers will not be asked to give any blood unless and until an emergency arises. Their services will be required at the places where they have been registered, or, if they have moved, at the nearest hospital where the blood is being collected.

Medicine Advertisements in Stamp-books

Sir ARNOLD WILSON asked the Postmaster-General how many stamp-booklets had been issued, or prepared for issue, containing an advertisement of a proprietary medicine which promised immediate results to sufferers from rheumatism, backache, painful joints, and affections of the kidney, bladder, and prostate gland, on what date the existing contract for this advertisement would terminate, and whether his department had sought any expert advice as to whether or not it was in conformity with the restrictions proposed by the Select Committee of 1912.—Major TRYON replied: The answer to the first point is 10½ million, to the second, that there is no standing contract, and to the third, in the negative. Advertisements which specifically purport to cure any of the diseases mentioned in paragraph 58 (2) of the Select Committee's report are rejected. As the Assistant Postmaster-General stated in answer to a question on June 28, I am looking further into the policy of the Post Office in this matter.

Sir A. WILSON asked if the Postmaster-General would canvass the Government departments and the marketing boards with a view to pointing out the great opportunities offered to them by the space in these booklets.—Major TRYON said that the whole matter was being considered.—Mr. HARVEY asked if the right hon. gentleman would consult the Minister of Health on the matter of these advertisements.—Viscountess ASTOR: If you cannot advertise a cure for cancer, why can you advertise a cure for all these complaints?—No further reply was given.

Inoculation and Dental Treatment of Militiamen

Mr. NAYLOR asked the Secretary of State for War whether it was intended that militiamen should be subjected to inoculation and/or vaccination, and whether they would be given the option of refusing *without* penalty.—Mr. HORE-BELISHA replied: Militiamen will not be compulsorily inoculated or vaccinated.

Captain ELLISTON asked whether, except in cases of urgent emergency, militia recruits requiring artificial dentures might be directed to secure treatment in the manner authorised by the National Health Insurance Acts—namely, by obtaining dental letters from their approved societies for presentation to any registered dentist.—Mr. HORE-BELISHA, Secretary of State for War, replied: Militiamen reporting sick on dental grounds during training will receive any necessary *treatment* from the army, free of charge, including artificial dentures when they are essential. While under training they will not be eligible for dental benefits under the National Health Insurance Acts. Those militiamen who were insured persons under the National Health Insurance Acts before being called up for service will continue to be insured throughout their training, the whole of the contributions being paid from army funds. They will, therefore, re-enter

civil life in exactly the same position with regard to dental benefits in their approved societies as if they had remained in insured civil employment

Foreign Doctors

Mr GEORGE STRAUSS asked the Home Secretary whether, in view of the shortage of doctors that would arise in the time of war, and the serious results of that shortage in the treatment of air raid casualties and the morale of the civilian population, he would consider increasing the number of work permits to well qualified refugee German and Austrian doctors.—Mr PEAKE, Under Secretary, Home Office, replied: After consultation with representatives of the medical profession permission has been given to a certain number of foreign doctors who have come here as refugees to practise or to take appointments in this country, but there is a limit to the number of foreign practitioners who can properly be absorbed in the medical profession. The information my right hon. friend has as to the present position does not suggest that there is any such shortage or prospective shortage of doctors as would warrant any large addition to the number of foreign practitioners.

Insurance Benefits and Income-tax

Mr BENN asked the Chancellor of the Exchequer under what statutory authority an income tax assessment was made on benefits paid to persons under the National Health Insurance Acts.—Sir J. SIMON replied: Benefits under the National Health Insurance Acts are not regarded as constituting income, and consequently as attracting income tax. There is no express definition of "income" in the acts but the above view has always been maintained in administering the acts.

Milk in Industries Scheme

Mr ROBERT GIBSON asked the Minister of Agriculture how many firms had taken advantage of the milk in industries scheme, how many workpeople, men and women, respectively were employed by those firms, how many of these took advantage of the scheme and if he would give the names of the larger firms that had recently joined the scheme.—Sir REGINALD DORMAN SMITH replied: I am informed by the National Milk Publicity Council that at the end of June this year 7123 firms in England and Wales were taking advantage of the milk in industries scheme. These firms employ 2,237,500 persons, but I am unable to say how many of these actually take milk under the scheme. A similar scheme is organised by the Scottish Milk Marketing Board in its area and I understand that about 1200 firms are taking advantage of it. While I cannot say how many persons are employed by those firms, I am informed that about 60,000 people are consuming milk under the scheme. As regards the last part of the question, I am told that the scheme has recently been adopted in England in the Vickers Armstrong works at Barrow in Furness and in the Imperial Chemical Industries works at Billingham, and in Scotland by Messrs. Barclay, Curle and Co. and Messrs. Stewart and Lloyds, both of Glasgow, and by Messrs. Redpath, Brown and Co. of Edinburgh.

Milk for Civil Servants

Mr ROBERT GIBSON asked the Minister of Health whether negotiations for providing milk for civil servants in Whitehall had been completed, what arrangements had been made for the distribution of milk, when the arrangements would come into operation and at what times of the day the milk would be available, and how many civil servants would be able to avail themselves of the scheme.—Mr ELLIOT replied: So far as my department is concerned arrangements are being made as indicated in the question by the departmental Whitley council through the National Milk Publicity Council. The delivery of milk will be between the hours of 10 and 11 A.M. to such of the staff as wish to participate. The date agreed provisionally for the commencement of the scheme is Sept. 4.

Pithead Baths

Mr CAPE asked the Secretary for Mines how many mines were equipped with pithead baths up to the end of June, 1939, the districts covered, and the number of men and boys provided for in these baths.—Mr GEOFFREY LLOYD replied: 287 pithead baths with accommodation for 361,732 men and boys and 760 women had been completed up to the end of last month. They are distributed equitably amongst all the coalfield districts, as shown in the published List of Pithead Baths (1939 edition), a copy of which I am sending to the hon. member.

Sulphanilamide Preparations

Mr JOHNSTON asked the Secretary of State for Scotland to what extent the circular letter of Feb. 16 1938, from the Department of Health for Scotland had stimulated a more extended use of sulphanilamide preparations for streptococcal and urinary infections, and if he had any information as to the hospital bed accommodation which might thereby be made available for war emergency purposes.—Mr COLVILLE replied: The use of these preparations by the medical profession in Scotland is, I am informed, increasing, but some of the newer derivatives particularly are still in the experimental stage. The answer to the last part of the question is in the negative.

Infectious Disease at Anti-aircraft Camps

Sir THOMAS COOK asked the Secretary of State for War what arrangements had been made to deal with possible outbreaks of infectious disease at the anti aircraft camps at Weybourne and Stiffkey and other War Office establishments in Norfolk.—Mr HORE BELISHA replied: Arrangements have been made for cases of major infectious disease to be admitted to civil isolation hospitals, and for cases of minor infectious disease to be admitted to the Military Hospital, Colchester.

Pharmaceutical Services in Army and R.A.F.

Mr THORNE asked the Secretary of State for War if he would consider setting up a committee, under the director-general of Army Medical Services, with the object of organising an efficient pharmaceutical service for the Army and the Royal Air Force.—Mr HORE BELISHA replied: My right hon. friend the Secretary of State for Air and I are both satisfied that the dispensing requirements of the Army and the Royal Air Force are adequately met by existing arrangements.

Production of Antitoxic Sera

Mr LYNCH asked the Secretary of State for War whether, in view of the valuable work rendered by army horses, he would prevent the sale of those horses no longer fit for active service to manufacturing chemists to be used for the purpose of producing antitoxin.—Mr HORE BELISHA replied: The production of antitoxic sera is a work of the utmost national importance, and I am advised that cast army animals are for technical reasons, the most suitable for this purpose, and the process involves no cruelty to the animals.

Treatment of Disabled Ex-Service Men

Mr BURKE asked the Minister of Pensions how many disabled ex-Service men had received treatment by the Ministry of Pensions during the last twelve months, and of these how many received special full treatment allowances, as laid down in article 6 of the Royal Warrant.—Sir W. WOMERSLEY replied: The number of disabled ex-Service men who received treatment at one time or another in the course of the twelve months ended June 30 1939, was 13,013 including 5637 cases in mental hospitals. The records of my department do not enable me to give the precise information asked for in the latter part of the question, but it may be taken that in the great majority of cases full treatment allowances were payable.

"An old English physician has written 'It is allowed that our first master Hippocrates never showed more wisdom and greatness of mind than in confessing his mistake in taking a fracture of the skull for the natural suture.' Hippocrates put that mistake on record, but we are not told that he made the confession of it to his patient. A doctor may hide his mistakes from his patients without loss of truth, but he must never conceal them from himself."—Prof. CHARLES MCNEIL addressing graduates of the University of Edinburgh on July 19.

MEDICAL NEWS

University of Cambridge

At recent examinations the following candidates were successful :—

D M R E

Part I—R D Howat and S R Reynolds
Part II—H N Bhatt, J P Bostock, Frederic Bush, F M Crawshaw, W G S Harden, T M. Hennebry, C W Horncastle, K A K Kassem, C F MacGuire, S A Maddocks, R T Marshall, G F Rees-Jones, Zoë C Rutherford, Eric Samuel, Ida B S Scudder, and W E M Topping

University of London

At recent examinations the following candidates were successful :—

M S

Branch I (Surgery)—F R Kilpatrick, Guy's Hosp.; W R Merrington, B Sc, Univ Coll Hosp, and J E Spalding, Guy's Hosp
Branch III (Ophthalmology)—C J F. Blumenthal, Guy's Hosp

Dr. W. G. Barnard has been appointed to the university chair of pathology at St. Thomas's Hospital medical school.

Dr Barnard is 46 years of age He began to study medicine at the London Hospital, but his studies were interrupted by his war service in France in the Field Artillery for two years He was gazetted out of the Army in 1917 in order to qualify, and in 1920 obtained the M R C S, L R C P After holding a clinical appointment at the London Hospital he worked in the pathological institute there, becoming junior assistant director of the institute From 1923 to 1931, he was pathologist to University College Hospital and lecturer in morbid anatomy and curator of the museum in the medical school; during this period he worked for six months in 1927 as voluntary assistant to Professor Aschoff in Freiburg In 1931 he was appointed consultant histologist to the London County Council and pathologist-in-charge of the Council's central histological laboratory at the Archway Hospital He has examined in pathology for the Conjoint Board for the past three years Dr Barnard was elected to the fellowship of the Royal College of Physicians last year He published a textbook entitled "Elementary Pathological Histology" in 1928 and has written many other papers on pathological and medicolegal subjects

The title of reader in medicine in the university has been conferred on Dr E F Scowen in respect of the post held by him at St Bartholomew's Hospital medical college.

Dr. R M. Calder has been reappointed to the Graham scholarship in pathology for a further period of one year.

Applications are invited for the William Julius Mickle fellowship of the value of at least £200. It will be awarded by the senate to the graduate of the university, resident in London, who has done most to advance medical art or science within the last five years. Further information will be found in our advertisement columns

University of Edinburgh

At a graduation held on July 19 the address to the new graduates was delivered by Prof Charles McNeil. The following degrees and diplomas were conferred :—

M D—P C Davie, †H L deWaal, I J Freedman, J A Guy, Robert Hardy, F D Hart (*in absentia*), * J S Jeffrey, J A M'Lauchlan, ‡W M. Millar, ‡R A. Miller, A R M Moir, J M Rogan (in absentia), Maud I Smith, and *Harry Stalker
C M—‡C F W Illingworth

† Awarded gold medal for thesis
‡ Highly commended for thesis
* Commended for thesis

M B, Ch B—W J Abel, Catherine J. A Aitken, Han Ap Thomas, M W Archdall, G W Baker, G W Balfour, Beatrice M Bartlet, Murdoch Beaton, Thomas Black, James Borrowman, Anne E Boyd, D K Bradley, G A R Brown, H M Brown, Kathleen M Buchanan, D W Burton, C S Campbell, I D Campbell, William Carruthers, T S Chalmers, A J Clarke, J C Comline, Leonore S Cooke, Monica de S Craig, W G. *With honours

B Sc—G W A Dick, M B, and William Forbes, M B (with first-class honours in pathology)
D P H.—G F Anderson, C E S Bailey, D W Graham (in absentia), Alison M B Hamilton (in absentia), Betty C Hamilton (in absentia), M S Khan, R B Lucas, Edith M Martin, R M Ross (in absentia), Jasmine Taylor (in absentia), and R M. White (in absentia)
D T M & H—H L de Waal, Thomas Evans, and Joan F M E Lamplugh
Diploma in Psychiatry—S I Ballard, Kathleen B Cobb, J J M Jacobs, W W Laughland, James Leckie, Antranig Manugian, W M Millar, and R M Young
D M R—W. N Brown, and Joseph Phelan

The following awards of prizes were made —

Cameron prize in practical therapeutics to Gerhard Domagk, Elberfeld, in recognition of his discoveries which initiated the treatment of diseases of bacterial origin by compounds belonging to the sulphonamide group; Ettles scholarship and Leslie gold medal, R H Girdwood, M B, Scottish Association for Medical Education of Women prize, Leonore S Cooke, M B; Mouat scholarship in the practice of physic, D W Burton, M B, Buchanan scholarship in midwifery and gynæcology, Betty P M'Clements, M B., James Scott scholarship in midwifery and gynæcology, Leonore S Cooke and Nancy S M Milne, M B; Dorothy Gilfillan memorial prize, Glenys M M Donaldson, M B, Conan Doyle prize, D W Burton; Beaney prize in anatomy and surgery, Keith memorial prize in systematic surgery, Royal Victoria Hospital Tuberculosis Trust gold medal, and Wightman prize in clinical medicine, R H Girdwood, Annandale gold medal in clinical surgery, Leonore S Cooke; Murdoch Brown silver medal in clinical medicine, Glenys M M Donaldson, Sir Robert Jones prize in orthopædic surgery, Constance F Hardy, M B; Sir Humphry Rolleston prize, Maxwell Gardiner, M B, Marchison memorial scholarship in clinical medicine, A J M Drennan, M B; M'Cosh bursaries, James Innes, M B, and F H. Robarts, M B., Vans Dunlop scholarship in public health and clinical therapeutics, I A G MacQueen, M B, Gunning Victoria jubilee prize in bacteriology, in therapeutics, and in child life, and health, H L de Waal, M D, J D Allan, M B, and R. A Miller, M D, respectively; Thomson memorial medal in child life and health, R. A. Miller, Wellcome medals and prizes in the history of medicine, H L de Waal and Sarah H Graham, M B

Royal College of Physicians of Edinburgh

A meeting of the college was held on July 18, with Dr. Alexander Goodall, the president, in the chair. Dr Basil George Tonge Elmes (Nigeria) and Dr. Alistair Gibb Stevenson (Durban) were elected to the fellowship

Royal College of Surgeons of Edinburgh

At a meeting of the college held on July 21, with Mr W. J Stuart, the president, in the chair, the following were admitted to the fellowship :—

Robert Randolph Mutrie, M D, Queen's Univ, Kingston, George Alexander Hay Adam, M B Glasg; Henry Israel Baigel, M B Cape Town; Arthur Fawcett Miller Barron, M D Edin, Thomas John Beresford, M B Melb, Arthur Bickford, M D Man, Willem Christiaan Botha, L R C P E, William Scott Charlton, M B Sydney; Sidney Joel Cohen, M B Witwatersrand, David Hunter Cummack, M B Edin Tulsi Das, M B Punjab, Edmund Were Dorrell, M R C S; Gordon Walter Duncan, M B Lond, John Woodward Hannay, M R C S, Edward Spcld Jamieson, M B N Z, Beatrice Mary Joly, M D Lond; Marcus Matthew Kennedy, M B, Sydney, James Tait Laurenson, M B N Z, Donald McIntosh, M B Edin, Ronald Duncan Macrae M B Aberd Kenneth Ian Macrosson M B Glasg, George Brown Mair, M B Glasg., William Alfred Mort Marrow, M R C S; Mahmuda Ghulam Mohamed M B Punjab, Frederick Thomas Moore, M R C S, Horace Gordon Page, M B Edin, William Mathias Quin, M B Edin, Harold Roche Robertson, M D McGill, John Mannix Robins, M R C S, John Alfred Shepherd, M D St And, Max Leonard Slotover, L R C P I, Kenneth James Talbot, M B N Z, Jacob Jozua van Niekerk, M R C S, and Edwin Perry White, M D, Queen's Univ, Kingston

Naval Medical Compassionate Fund

At the quarterly meeting of the directors of this fund, held on July 14, with Surgeon Rear-Admiral C V. Griffiths, deputy medical director-general of the Navy, in the chair, the sum of £66 10s was distributed among the several applicants

Society of Apothecaries of London

At recent examinations the following candidates were successful —

Surgery—M G Braham A N Coondoo M E Davies, E A Griffiths, I M Monare C E S Myers, C J Pollard D Pryser-Jones W E Roden and W N Vellacott

Medicine—C V Arthur, J J Brenner A N Kalra, S T Nakib, C J Pollard S A Schuyler W Simpson and A T M Wilson

Forensic Medicine—C V Arthur, N F Bishai, J J Brenner, A N Kalra S T Nakib, C J Pollard S A Schuyler, W Simpson, S Smith, and A T M Wilson

Midwifery—D Gallivan J N Hunt A G McPhillips, N A St C Marley, T Owen C J Pollard and D Pryser Jones

The following candidates, having completed the final examination, are granted the diploma of the society entitling them to practise medicine, surgery and midwifery —

C V Arthur, St Mary's, N F Bishai, Birm and West London, A N Kalra Univ Coll Hosp I M Monare, Roy Colls, Edin C J Pollard, Lpool and West London, S A Schuyler Charing Cross W Simpson St Mary's, and S Smith, Manc

Royal College of Obstetricians and Gynæcologists

At a meeting of the council held on July 22 Prof W Fletcher Shaw was re-elected president, and Mr Eardley Holland and Prof Miles Phillips were elected vice presidents The following officers were also elected hon treasurer, Dr J P Hedley, hon curator of museum, Mr Alcock Bourne, hon librarian, Mr Frederick Roques, and hon secretary, Mr G F Gibberd

The following were admitted by the president —

Fellowship—Douglas Hamilton MacLeod (London)

Membership—J L Cameron (London) W M Capper (Bristol) Anthony Charles (London) Alice E Dickie (London), and C M Hopkins (Australia)

The following were elected to the membership —

R I Ritchie (New Zealand) B H Anderson (Melbourne) A W Andison (Canada), G W Blomfield (Leeds), D R Cairns (London), W D A Callam (Edinburgh), D G W Clyne (London) Gilbert Dalley (London) D S Greig (London), T N Hart (Bolton), William Hawksworth (New Zealand), W M Lennon (Melbourne) G G Lennon (Birmingham), F H Lord (Melbourne), Ruvin Lyons (Canada), T A Macfarlane (New Zealand) D M W Maxwell (Windsor) Shivaprasanna Misra (Calcutta), C W Salisbury (Sydney), Everall M. Shippam (London), Richard de Soldenhoff (Lyme Regis), P A Thomas (India), G B Thomas (Lahore), S L Townsend (Melbourne) J D Watt (Romford) and Lila Windeyer (Sydney)

National Radium Trust

Mr E S Hill has been appointed secretary of the Trust in place of Mr R Stanton, who has resigned the secretaryship on his promotion in the Ministry of Health

London School of Hygiene and Tropical Medicine

On the results of the D P H examination the Chadwick Trust prize has been awarded to Dr R C Wofinden On the results of the D T M & H examination the Duncan medal has been awarded to Dr R J Riddell and the Lalcaca medal to Dr D A Cannon

Prize-giving at the Middlesex

On July 20 Sir Edward Mellanby K B S presented the prizes gained at the Middlesex Hospital medical school at the Queen's Hall Mr S A Courtauld, chairman of the school council presided, and Prof W B Tuck delivered an address on the chemical elements Dr H E A Boldero the dean said that for the whole year the work of the school had been carried on under the shadow of a national emergency The Government plan for the treatment of casualties had its advantages as regards clinical teaching in that Middlesex physicians and surgeons would be attached to the various hospitals of sector 5, and students would be able to go to the same hospitals The preclinical students who had done two terms of anatomy and physiology would go to a university in the west of England and their teachers would go with them It had been a remarkable year he said in the way of research, striking work having been done at the Bland Sutton Institute under the leadership of Professor McIntosh, on M & B 693 and at the Courtauld Institute, under the direction of Professor Dodds on stilboestrol The new block of school buildings was nearing completion and would be ready for occupation at the beginning of next term A sum of £20 000 was still needed to pay for the new buildings

University College Hospital

The Bilton Pollard fellowship has been awarded to Dr M L Rosenheim

Postgraduate Orthopædic Course in Paris

A postgraduate course on "technique chirurgicale concernant l'appareil moteur" will be held at the Faculty of Medicine in Paris from Oct 16 to Nov 4 The lecturers will include Prof L Ombrédanne and Prof Paul Mathieu Further information may be had from Prof Mathieu at Hôpital Cochin, Paris

National Hospital, Queen Square, London

Two courses of lecture demonstrations on neurology will be held at this hospital, one from October to December and one from January to March Further particulars may be had from the dean of the medical school

International Council of Ophthalmology

Prof J Meller (Vienna) has been nominated president of the next congress of the council, which is to be held in Paris in 1940 on the day before the opening of the annual meeting of the Société Française d'Ophtalmologie The main subjects for discussion will be plastic operations on the eyeball and the pathology of retinal detachment An international standard for the determination of the axes of astigmatism will also be considered at the congress

Royal Society of Medicine

The Royal Society of Medicine has made the ninth award of the William Gibson research scholarship for medical women to Miss Diana Kinloch Beck, who is working at the Radcliffe Infirmary, Oxford, for her proposed research on the cerebral vascular system in relation to cerebral aneurysms and their surgical treatment

Royal East Sussex Hospital, Hastings

At a meeting on July 11 the general committee of this hospital decided to close one large and three small wards, and seven clinics in the outpatient department The hospital has an overdraft of over £36,000 and an ultimatum has been received from the bank that this must be reduced by £2500 by the end of the year The money can only be found by revising the ordinary expenditure Special arrangements have been made in the outpatient department to deal with members of the benefident fund and other contributory schemes, and the agreements with local authorities will also be unaffected by the changes A special committee has been formed to launch an appeal for funds Last year's income was £28 000, a further £6000 will be required annually if the wards and clinics are to be reopened

International Congress for Radiology

The sixth International Congress for Radiology will take place in Berlin from July 31 to Aug 4, 1940 General subjects proposed for discussion include special methods of examination in radiological diagnosis, and the development of therapeutic methods, their achievements and the demarcation of their indications A series of lectures will describe the present state of knowledge as regards the effect of rays on the living cell, and the development of radiophysics The congress will also meet in the following sections radiological diagnosis; radiotherapy; radiobiology physics and technique; and electrology and light Further information may be had from the secretary general, Prof W Baensch, Liebigstrasse 20 Leipzig, C 1

University of Basle

On the occasion of the inauguration of the new university buildings the honorary degree of M D was conferred upon Dr Max Hartmann of St Gall, chief of the research laboratories of the Ciba works at Basle It was Dr Hartmann's interest in the chemical aspect of biological problems which inspired his activity in the field of chemotherapy and led him first to the discovery of the properties of Coramine, then to the isolation of the hormones of the corpus luteum, and more recently to the isolation of substances regulating arterial tension Two derivatives of this latter group are now available for clinical use The medical faculty of Basle has recognised the high scientific standard maintained in the chemo pharmaceutical research laboratories which has enabled them to render great service both to practical medicine and the advancement of medical science

OBITUARY

WILLIAM ALEXANDER POTTS

M.A CAMB., M D EDIN. AND BIRM

Dr W A. Potts, who died on July 23 at his home in Edgbaston, Birmingham, at the age of 73, will be chiefly remembered in his capacity as psychological adviser to the Birmingham justices. It was in the year 1919 that Mr. Gerald Blesley, deputy chairman of the Birmingham bench, suggested that a physician with expert knowledge of psychiatry should be attached to the court with whom the justices could take counsel. The suggestion was based on the example of Chicago where in 1914, at the instance of chief justice Harry Hobson, a psychopathic laboratory was instituted under the direction of W J. Hickson which demonstrated the utility of psychiatric assistance in deciding on the treatment of offenders. Later that year the prison commissioners appointed Hamblin Smith whole-time medical officer to Birmingham prison and Potts was attached to the court to advise where accused persons were remanded on bail or charged on summons. Thereafter, when an alleged offender was suspected of being mentally abnormal, the court agreed to postpone action until a full medical inquiry had been made Potts was regularly to be seen about the police-courts offering advice in a difficult case and more formal evidence under mental-deficiency procedure To the casual glance he was cold, aloof and official in manner but the dour exterior scarcely hid a gentle and painstaking spirit, anxious to relieve human distress

[Whitlock, Birmingham

By education and upbringing Potts was singularly qualified for his task Coming of a well-known family of brass-founders in Birmingham, his father was a schoolmaster and he was himself trained to be a pedagogue until his father's death when he was 23 left him free to study medicine He had been head-boy at Fettes under his father's headship, had taken honours at Emmanuel in the mathematical tripos, and had taught at Bilton Grange, Rugby He won a Thomson bursary to Edinburgh and after qualifying in 1895 was house-surgeon to William Annandale, after which a year spent at the East Riding mental hospital gave the turn to his career, for he discovered there that the mentally defective was not unamenable to moral suasion. After further resident experience at Edinburgh he went into partnership at Edgbaston with W. S Mann, whose third daughter he married in 1899 They had four sons, one of whom is now a doctor and one a schoolmaster. He had twenty years in busy general practice, becoming physician to the Maternity Hospital and lecturing on pharmacology in the University, and these years confirmed his growing interest in the mental and physical equipment of the adolescent and its effect on conduct

When the Royal Commission on the care and control of the feeble-minded was constituted in 1904 and it was decided to make regional investigations into the incidence of feeble-mindedness in the general population in selected areas, Potts was chosen to carry out this survey in Birmingham and neighbourhood Through the enthusiasm of Mrs Hume Pinsent, Birmingham had done pioneer work, before the 1899 act, in the education of feeble-minded children, and in due course Potts became chairman of the special-schools aftercare committee, where he was closely associated with G A Auden The commission's report led to the Mental Deficiency Act, 1913, and it was then that Potts's long experience and detailed knowledge marked him for medical adviser to the Birmingham mental-deficiency committee—an appointment which he held until within a few weeks of his death His energies were not confined to the routine duties of this office; he was in request as a speaker and lecturer, whether to teachers on the springs of delinquency or to parents on the adventure of adolescence. He collaborated with G E Shuttleworth in the later editions of "Mentally deficient Children," his chief contribution being the chapter on the psychopathies of puberty and the severance of juvenile delinquency from the hazy notion of moral imbecility He also acted as adviser to the Great Barr Park colony and to the mental wards of the Hallam Hospital Later he became consultant to the Royal Albert Institution at Lancaster and the Tavistock Clinic in London Everywhere he was a courteous and kindly colleague who did his duty with a full sense of his responsibilities to the individual under examination and to the public whom he served —and this in spite of increasing physical disability from progressive osteo-arthritis

Dr. Freize Stephens writes: "To those who met Dr. Potts for the first time in the last ten years of his life his unfailing courage must have been a source of continual admiration, for often, when obviously racked with pain, he would insist on going a tiring journey to comfort some patient who had consulted him, or to attend a medical meeting on some topic dear to his heart, or to support a young colleague reading his first paper to a learned society's gathering, and on all those occasions to the anxious inquiry of an older colleague would come the challenging reply. 'There's nothing wrong with me. I'm all right—quite all right' It was the same spirit of defiance which stood him in good stead in those early pioneering days that he devoted so ardently to the welfare of the mentally defective and juvenile delinquent. His courage and his gentle forbearance of ignorance and ridicule were the outstanding characteristics of his life; he would never accept defeat, and when all seemed lost he would quietly marshal his forces again and march them on to an abiding success Today we appreciate and value the results of those achievements in the surer understanding of the problems involved, in the better provision for the institutional and community care of the feeble-minded, and in the humane clauses of the Criminal Justice Bill—we appreciate these successes and forget the disappointing delays, the long and tedious discussions, the patient bouts with wilful misunderstanding and dull authority, and the interminable and often most unnecessary investigations and inquiries which eventually led to those triumphant results. In the light of what has happened it is interesting to note that Potts was successively a schoolmaster, an assistant medical officer in a mental hospital, a general practitioner of over twenty-years standing, and the chairman of the aftercare committee of the special schools of Birmingham before he decided to enter

the civic arena in order to gain statutory recognition for his psychological ideals So long and patient an apprenticeship was surely worthy of a great psychologist, and a great psychologist he was without a doubt Many an honour he received testified to this fact but his most treasured possession was the gratitude of his poorest patients, outcasts of the city, to whose homes a visit from Dr Potts made a day of splendid memory He too delighted in those visits, and to the end they remained his happiest activity"

HUGH NEVILLE TAYLOR

M A, CAMB, M D DUBL, I R C S E

Dr Neville Taylor died on June 28 at Newport, Mon, whither he had retired three years ago from his life work at Ebbw Vale Born at Coltcshall, Norfolk, and educated at Oundle, Taylor gained first class honours in 1883 in the natural sciences tripos at Cambridge and went on to Edinburgh where he qualified in 1891, later taking the F R C S E After a further period at Trinity College, Dublin, he settled in practice at Llandovery About 30 years ago he accepted appointment as surgeon to the Ebbw Vale general hospital which was then run by the workmen's medical society of which he became president This venture, which was at first in the nature of an experiment, was attended with remarkable success and Taylor gradually extended his sphere of influence in the neighbourhood On the death of Dr J W Davies he became medical officer of health and school medical officer under the urban district council, which he induced to appoint a separate committee for health and sanitary matters Under his direction many important improvements took place including a reorganisation of the water supply After giving up his official position he was elected to the council for the central ward, securing 1438 out of a total of 1500 votes, having conducted his election campaign without outside help He soon became chairman of the health committee and also of the parliamentary committee Early in his professional life Dr Taylor married Ethel Winifred Hughes Morgan and together they worked without ceasing for the betterment of one of the most distressed areas in the country Some revival of industry has now come to the valley and it was a satisfaction to Taylor that he lived long enough to see the beginnings of that revival.

Taylor was a barrister at law and medical referee for the Ministry of Pensions, during the war he served with the rank of major in the R A M C (T), and in his early days he contributed a number of clinical notes on interesting cases to the medical journals His position at Ebbw Vale came under some criticism from colleagues who could not fail to recognise not only his great ability but also his high ideals and sense of professional ethic

WILLIAM EDMUND COOKE

M D LIVERP F R C P

Dr Cooke, director of the pathological department at Wigan Infirmary, and an authority on diseases connected with coal mining, died suddenly on July 20 at Euston Station He was the son of Luther Cooke and was born at Aspull, Wigan, in 1881, being educated at Bullingham Ampleforth, and Liverpool University, where he took his M B in 1904 During the years before the war his main interest was in tuberculosis After a time at Walthamstow sanatorium he was head of Ochil Hills sanatorium and Coppins Green industrial sanatorium, doing some original work on the pathology and radiology of phthisis He took the D P H and the M R C P L in state medicine in 1913, and during the war was first in charge of the isolation hospital at Aldershot and later served in Egypt On his return he took over the pathological and bacteriological work at Wigan Infirmary, becoming also consultant pathologist to various sanatoria and borough councils in the neighbourhood and hon medical adviser to the Wigan mining and technical college Dr Cooke was responsible for the section on anthracosis, asbestosis, and kindred conditions in the Encyclopædia of Medical Practice

PANEL AND CONTRACT PRACTICE

Militiamen and Territorials

THE Minister of Health has decided that although militiamen are not entitled to medical benefit during the period of their service with the forces their names will not be removed from the lists of their insurance practitioners Any question of reinstatement on discharge to civil life will not accordingly arise The necessary financial adjustments are being effected centrally by reducing the amount of the medical pool Officers and men of the reserve and auxiliary forces who are called up for service and were previously insured will continue to pay contributions at the full employed contributor rate during their period of service, and will remain entitled to all benefits Insurance practitioners must accordingly be prepared to provide treatment for any such men included in their lists who may need it The period of service in the Territorial Army, the Royal Naval Volunteer Reserve and the Auxiliary Air Force will be about a month, and in the Army Reserve the Royal Fleet Reserve and Air Force Reserve about three months

Expensive Drugs

The Minister of Health, as we report on another page, denied that he had refused to allow M & B 693 to be used for the treatment of insured persons He was asked if it was not a fact that when he was requested to put this remedy on the special list of expensive drugs he had said that he could not allow this but in a year's time when the price of the drug was reduced he would consider it Mr I Hall replied that this drug is available, always has been available and always will be available to insured persons, and the suggestions that it is not are totally unfounded and, what is more, dangerous to the health of the public

The main point is whether practitioners who dispense for insured patients must provide this drug as part of their obligation or whether they should be allowed to make a supplemental charge on the ground of its expense According to the report of the June meeting of the insurance acts committee the Minister had been asked to include M & B 693 or any approved substitute in the list of drugs appended to the second part of the distribution scheme This list serves a twofold purpose It sets out the drugs and appliances which may be either prescribed by or supplied by practitioners who ordinarily issue prescriptions and it is also a list of drugs and appliances which if supplied by a dispensing doctor are not regarded as falling within the quarterly payment,

now 7½d per patient. Thus a doctor is entitled to be paid for any of the items included in this list which he supplies to his patient whether he is a prescribing or dispensing practitioner. The departmental view was that it was unlikely that the present price of the preparation would be maintained and therefore the question should be deferred for twelve months, but it was added that the Minister had in the past given and would continue to give favourable consideration for special payment in respect of the supply of the preparation.

Vacancies

For further information refer to the advertisement columns

Ashton-under-Lyne, Lake Hosp —Res obstet O, £350
Bedford County Hosp —First and second H S, at rate of £155 and £150 respectively
Birmingham City Education Committee —Asst school M O, £500.
Birmingham, Dudley Road Hosp.—Jun M O, at rate of £200
Birmingham, Monyhull Colony Mental Deficiency Institution —Med supt, £1000
Bristol Royal Infirmary and Bristol General Hosp —Locum tenens, at rate of £500
Bristol University —Asst lectureship in pathology, £300
Bucksburn, Aberdeenshire, Rowett Research Institute —Head of physiology department, £800
Cardiff, King Edward VII Welsh National Memorial Association Three half-time asst. tuberculosis O's, each £250 Also asst res M O for Sully Hosp, £200
Chester, Barrowmore Tuberculosis Sanatorium and Settlement, Great Barrow —Jun asst M O, £200
Chester City Hosp —Jun. res M O, at rate of £150
Derbyshire Education Committee —Asst school M O., £500.
Dorchester, Dorset County Hosp —H S, at rate of £150
Dorset County —M O H, £800
Dover, Royal Victoria Hosp —Two R M O's, each £140
Dudley, Guest Hosp —Res surg O, at rate of £250–£300 Also H S, £150
Dumfries County Council —County bacteriologist, £650
Durham County Hosp —H S, at rate of £150
Elizabeth Garrett Anderson Hosp, Euston Road, N W 1 —Hon asst anæsthetist, 10 guineas
French Hosp and Dispensary, 172, Shaftesbury Avenue, W C 2. Res M O, £100
Golden Square Throat, Nose and Ear Hosp, W 1 —House anæsthetist, £150
His Majesty's Colonial Service —Two health officers for British Guiana, each £650
Huddersfield Royal Infirmary —Cas O, at rate of £200
King Edward Memorial Hosp, Mattock Lane, Ealing, W.13 —Cas O and H S, at rate of £150
Liphook, Hants, King George's Sanatorium for Sailors —Asst. M O, at rate of £200
Liverpool University —Demonstrator in physiology, £300.
London Chest Hosp, Victoria Park, E 2 —H.P., at rate of £100
London Hosp, E 1 —Surgical first asst and reg, £300 Also first asst and reg to ear, nose and throat depts, £150
London University, W C 1 —William Julius Mickle Fellowship, £200
Malda Vale Hosp for Nervous Diseases, W 9 —H P, at rate of £100
Maidstone, West Kent General Hosp —H P and H S, each £175.
Manchester, Christie Hosp and Holt Radium Institute, Withington Res M O, at rate of £150
Manchester, Royal Children's Hosp, Pendlebury —Res surg O and asst M O for outpatients' dept, each at rate of £150
Manchester Royal Infirmary —Jun asst M O for radiological dept, £350 Also asst M O for massage and electric dept, £100
Manchester, Saint Mary's Hosps —Res obstet O for Whitworth Street Hosp, £150 Asst res obstet O for Whitworth Street Hosp and jun res anæsthetist, each at rate of £100
Middlesbrough County Borough —Deputy M O H, £750
Newcastle General Hosp, Joint Committee's Clinic —H S. and jun clin asst, £250
Newcastle-upon-Tyne Hosp for Sick Children —H P and two H S's, each at rate of £100
Newcastle-upon-Tyne, Royal Victoria Infirmary —Res M O, £350 Also sen accident room H S, £150
Newport, Mon, Royal Gwent Hosp —Cas O at rate of £175
Portsmouth Royal Hosp —Cas. O, at rate of £130
Prescot, Whiston County Hosp —Sen res M O, £100
Preston, Sharoe Green Hosp —Jun asst res M O, at rate of £100
Queen's Hosp. for Children, Hackney Road, E 2 —H.S. and cas. O, each at rate of £100
Reading, Royal Berkshire Hosp —Res anæsthetist, at rate of £250 Also res M O, at Blagrave Branch Hosp and asst to pathologist (combined post), at rate of £150
Rotherham County Borough —Asst M O H, £600
Royal Army Medical Corps —Vacancies
Royal Eye Hosp, St George's Circus, S E 1 —Sen H S and two asst H S's, at rate of £150 and £100 respectively
Royal Free Hosp, Gray's Inn Road, W C 1 —Clin asst in gynæcological dept Res cas O, at rate of £150 Also first asst in children's dept, £100
Royal Naval Medical Service —Medical officers
St Mary's Hosp, W 2 —Jun asst radiologist, at rate of £75.
St Thomas's Hosp, S E 1 —Temp res asst physician, at rate of £225
Sheffield City —Asst tuber O for Winter Street Hosp, £350
Sheffield, Royal Infirmary and Hosp —Res H S to ophth dept, at rate of £80–£120
Southampton Children's Hosp and Dispensary for Women —Res. M O, at rate of £150
Southampton, Isolation Hosp and Sanatorium —Jun res M.O, £200
Southampton, Royal South Hants and Southampton Hosp —Sen H S, £200 Also res anæsthetist and H S to general surgical and ear, nose and throat wards, each at rate of £150.
Torquay Borough —Deputy M.O H and asst. school M O, £600
Truro, Royal Cornwall Infirmary —H P, £120
Wakefield City —Jun asst M O., £500
Walsall General Hosp —Res surg O, £300
West Riding of Yorkshire County Council —Asst bacteriologist, £650

Appointments

AINSCOW, C B, M B Manc, assistant school medical officer for Derby.
BODKIN, KATHLEEN M, M R C S, D P H, assistant medical officer of health and school medical officer for Hendon.
BULL, J W D, M B Camb, M R C P, D M R, hon radiologist to the Maida Vale Hospital for Nervous Diseases
CLIFF, MARGUERITE E, M D Manc, D P H, senior assistant medical officer of health for Staffordshire
COLLINS, G H., M B Glasg, junior assistant medical officer at the Isolation Hospital, Romford
COPE, R W, *M R C S, D A, anæsthetist to the Chelsea Hospital* for Women
CRIDLAND, NIGEL, B M Oxfd, D O, hon consulting ophthalmic surgeon to the Bognor Regis War Memorial Hospital
*DAVIES, D O, M B Lond, F R C S, resident surgical officer at the Crumpsall Hospital, Manchester
EVANS, BARBARA D. F, M R C S, assistant pathologist at the Elizabeth Garrett Anderson Hospital, London
*EVANS, W. G, M B Camb, D P H, medical officer of health and school medical officer for Canterbury
JAMES, URSULA, M B Lond, *medical registrar at the Elizabeth* Garrett Anderson Hospital, London
LAURIE, EDITH, M B Edin, D P H, assistant medical officer of health for Stirlingshire
LEYSHON, V N, M B Lond, D P H, assistant medical officer *of health for Bristol*
MCLEOD, G L, M B N Z, resident medical officer at the Royal Northern Hospital, London
NEWNS, G. H, M D Lond, M R C P, assistant physician to the Princess Elizabeth of York Hospital for Children, *London*
PEET, E W., M B N Z, F.R C S, hon assistant surgeon to the ear, nose, and throat department of the Radcliffe Infirmary, Oxford
PRATT, J S, M B Camb, resident medical officer at the City Hospital, Chester
REID, A C, M B, outpatient officer at the Royal London Ophthalmic Hospital
ROSS, H. J T, L R C P E, assistant resident medical officer in the tuberculosis section of the public health department, Birmingham
STALLWORTHY, J A, M B N Z, F R C S, M R C O G, hon assistant obstetrician and gynæcologist to the Radcliffe Infirmary, Oxford
STANFORD, SYDNEY, M B Lpool, junior assistant medical officer at the *City General Hospital, Plymouth*
THOMPSON, S M, B Chir Camb, F R C S, surgical registrar at the Stanmore branch of the Royal National Orthopædic Hospital, London
WHITE, R. A, M R C S, resident *medical officer at the King* George Hospital, Ilford
WILSON, A. H, M B Aberd, D P M, medical superintendent at Meanwood Park Colony, Leeds
WISEMAN, D C, M B. Glasg, resident medical officer at the City General Hospital, Leicester
WOODWARD, V. J, M B Lpool, D P H, assistant county medical officer of health for Derbyshire

* Subject to confirmation

". . The bad psychological effects of overcrowding of passengers will place a limitation on the size of long-range transport airplanes, it was reported at the San Francisco meeting of the American Society of Mechanical Engineers . The most crowded condition is represented by a trip of six people in a small motor-car. About 114 cubic feet of space is available, or about 19 cubic feet per person. This is tolerable only for a group of friends or relatives with common interests and then only because the scenery is changing very rapidly near-by the car. High overhead in an airplane the scenery frequently is monotonous except on those particular flights which may traverse a mountainous region Over-ocean flying is notoriously monotonous after the first few hours It is probable, according to experts, that 19 cubic feet of space for each passenger is the lower limit at which passengers can be attracted to aerial transport."—*Science* (suppl), July 14, 1939, p 8

NOTES, COMMENTS, AND ABSTRACTS

HOLIDAY RESORTS AND EVACUATION

SPEAKING at a conference of local authorities at Tunbridge Wells on July 19, Mr Walter Elliot said that he saw no reason to believe that evacuation would have to take place during the holiday season, but if it had special difficulties would arise in holiday resorts The Government's plan contemplated the dispersal of 3,000,000 people—mainly school-children with their teachers, younger children with their mothers, and expectant mothers—from the congested areas into relatively safer parts of the country in three or four days This operation was so gigantic and complex that one railway timetable—that of the Southern Railway for the evacuation of 475,000 persons from London alone—ran to 180 pages of close printing This timetable was only one of many To try to arrange for varying numbers of evacuees to be delivered to holiday centres according to the season of the year would, he said, introduce an unworkable complication People on holiday should not attempt to take their children back to an evacuable area if an emergency arose, but all who had essential work to do would be expected to return to their posts There would inevitably be overcrowding in holiday towns at the beginning of an emergency, and for a short time the ordinary standard of one person per habitable room would have to be exceeded The overcrowding would not last long because the evacuees would be redistributed

The Minister said that the transfer of handicapped children, expectant mothers and blind persons would be possible only where special arrangements for their reception had been made in advance, but difficulties were being surmounted For example, the London County Council had now been able to arrange for the reception in large houses and existing institutions of practically all handicapped children in their special schools Householders would not be expected to accommodate expectant mothers except on the understanding that the confinement would take place elsewhere

OVARIAN SYMPATHECTOMY

DESTRUCTION of the sympathetic nerve supply to the ovary, like many other operations on the sympathetic nervous system, has been practised on grounds rather of pious hope than of exact knowledge For example, R Démarez and L Devos (*Echo méd Nord*, 1939, 10, 233) base their advocacy of sympathectomy for certain ovarian lesions, particularly for sclerocystic ovaries, on the most meagre array of experimental evidence They admit that little or nothing is known of the influence of the sympathetic on the functions of ovulation and menstruation, and on the blood-supply and sensibility of the ovary, and that operations on the ovarian sympathetic supply are often unsuccessful Yet they then proceed to describe a large number of operations for the destruction of the ovarian sympathetic fibres either by section or by injection The reader cannot avoid feeling that a more critical attitude towards such procedures would save a number of patients from unnecessary operations

THE CHIROPODISTS' REGISTER

CHIROPODY is now a fully recognised and approved auxiliary medical service It has a status equal to that of the chartered masseur or masseuse, radiographer and biophysical assistant A degree of recognition was granted by the British Medical Association in July 1938 The details of control and supervision are delegated to the Board of Registration of Medical Auxiliaries This body is composed of representatives of the British Medical Association, the Society of Apothecaries of London the Chartered Society of Massage and Medical Gymnastics the Society of Radiographers, the Association of Dispensing Opticians and the Chiropody Group Council The council last named was formed by the board to act as the qualifying body to control and regulate the entry of chiropodists to the National Register of Medical Auxiliary Services, which is published by the board

In future, all chiropodists who satisfy the requirements of the board will be enrolled on this register A minimum course of training of two academic years has been laid down to allow for adequate clinical experience Chiropodists on the register have undertaken to confine themselves to their special subject, and not to treat anything below the level of the true skin, except under the direction and supervision of a medical practitioner Advertisement is forbidden to them, except "the insertion (subject to approval of the Chiropody Group Council) of announcements in appropriate approved newspapers concerning commencement of practice" The registrable qualifications in chiropody are member, fellow or associate of the Incorporated Society of Chiropodists (M I.S Ch , F I S Ch , and A I S Ch), and member fellow or associate of the British Association of Chiropodists (M.B.A Ch , F B.A Ch , and A B.A.Ch)

The register is supplied free to members of the medical profession, members of the public may obtain it on payment of 2*s* It is published by the Board of Registration of Medical Auxiliaries, B M.A House, Tavistock Square, London, W C 1

TREATMENT OF LAMBLIASIS

RESEARCH on the treatment of lamblia infection has been stimulated by a realisation that the disease is by no means confined to tropical regions A paper by M Maffi (*Arch Ital Sci Med colon* 1939, 20, 70) describes many methods of treatment which have been in vogue in some of these the aim has been direct intestinal antisepsis, as by bismuth or quinine, in others, use has been made of the indirect action of such drugs as neoarsphenamine or methylene-blue, through the liver and bile Maffi has developed a scheme whereby Atebrin is given by mouth in doses of 0 30 to 0 10 g (according to body weight) daily for some five days He has had uniformly good results in many cases, noting the disappearance of lamblia, both vegetative and cystic forms, from the faeces The treatment has caused no discomfort and he thinks that atebrin is now the remedy of choice in lambliasis

DOCTORS INTO MIDWIVES

THERE is, at the moment, a shortage of pupil-midwives, so we must welcome the scheme of the Midwives Department of the Coördinating Committee for Refugees for placing women refugee doctors in midwifery training schools They will train in these schools for two years, after which they will work for two further years as midwives in rural districts The intention is that they should eventually emigrate On starting their training they each need a good English textbook of midwifery, and doctors who no longer use their standard works would be doing a kindness by forwarding them to the chairman, Midwifery Department, Bloomsbury House W C 1 Doctors with spare books but no spare time to despatch them can drop a postcard to Bloomsbury House when arrangements will be made to collect them

GASTRO-ENTERITIS RESEARCH UNIT

A COMMITTEE was appointed in 1937 by the Medical Officer of Health for London to inquire into the ways of carrying out clinical and pathological research into the etiology, transmission and treatment of gastro-enteritis in children The committee suggested that a special unit should be established at a fever hospital for this purpose This suggestion was discussed at a conference with representatives of the Medical Research Council in January of this year and it was recommended that a research team should be formed at the North Eastern Hospital South Tottenham, consisting of a whole time non resident clinician, a whole-time assistant pathologist and two laboratory

technicians. One of the resident medical officers will also work with the clinician, and the pathological work will be under the general direction of the pathologist of the group laboratory at North-Western Hospital, Hampstead. As the question of ward infection enters into the problem of spread, the unit will collaborate with Prof. H. D. Wright, of Liverpool, Dr. W. H. Bradley, of Cambridge, and Dr. Joyce Wright, of London, who are already engaged in the study of ward infections with the support of the Medical Research Council. Adequate laboratory and other facilities are already available at the hospital.

ILLEGITIMACY AND THE LEAGUE

THE League of Nations has just published a short study on the legal position of the illegitimate child in the principal countries of the world.[1] In the last few years there has been a change in public opinion on the *illegitimate child, which is being regarded* more as the innocent victim of the irregular position of its parents. It is being granted rights similar to those of the legitimate child, or alternatively social measures are improving its position.

The study opens with a historical survey. This is followed by an analysis of the various laws on the civil status of the illegitimate child, its name, nationality, and legal domicile, measures to prevent disclosure of illegitimacy in official documents, re-establishment of the legitimate status, and inheritance rights. There is a chapter on the unmarried mother's rights, including her right to maintenance. The last part of the book deals with social insurance laws (which, in many countries, are definitely favourable to illegitimate children) and with special social welfare measures, including public assistance and preventive health measures.

MEDICAL RESEARCH COUNCIL

THE council invite applications for a fourth series of studentships and fellowships in clinical science and experimental pathology intended to encourage young British medical graduates of special ability and original mind to become investigators in branches of medical science which are concerned directly with disease as it occurs in human beings *Postgraduate studentships* are offered for medical graduates who have already held house-appointments and are strongly inclined to a career in clinical science or experimental pathology Each selected student will receive a stipend at the rate of £200 per annum, during a period not exceeding twelve months, for personal maintenance while undertaking approved courses of study in this country to advance his training in methods of research. This study may include modern languages and advanced physiological, pathological, and special clinical work under recognised teachers; but the approved course may not include studies of which the purpose is to enable the student to pass further examinations The council also offer *research fellowships* for candidates of similar qualifications who have already had some experience in the use of research methods Each fellowship will be tenable for one year at the ordinary value of £250 per annum, and will be renewable in approved instances at the rate of £300 per annum for a second year These fellowships are intended as probationary *appointments for research* in clinical science or experimental pathology under suitable direction in this country. Research expenses may be provided in addition to stipend. Applications should be lodged with the secretary of the council, 38, Old Queen Street, London, S W 1, before Oct 1

INDEX TO "THE LANCET," VOL I, 1939

THE Index and Title-page to Vol. I, 1939, which was completed with the issue of June 24, will be ready shortly A copy will be sent gratis to subscribers on receipt of a postcard addressed to the Manager of THE LANCET, 7, Adam Street, Adelphi, W.C 2 Subscribers who have not already indicated their desire to receive Indexes regularly as published should do so now

Births, Marriages and Deaths

BIRTHS

FINEGAN —On July 22, the wife of Dr G A Finegan, of Southgate, N 14—a daughter

ROBERTSON —On July 18, at Little Waltham, Essex, the wife of Dr H D Robertson—a daughter

ROFFEY —On July 15, at Sevenoaks, the wife of Dr Alec Roffey—a son

THOMAS —On July 14, the wife of Mr J M Ridley Thomas, F.R.C.S.E., of Norwich—a son

WIGGINTON —On July 16, at Eltham, the wife of Dr D J Wigginton—a daughter

MARRIAGES

O'DONOVAN—GILL —On July 22, at St Columba's Catholic Church, Selsdon, Denis Henry O'Donovan, M B , of Dublin, to Phyllis Marjorie Gill

ROBIN—CROFT —On July 19, at St Mary's, Lambeth, Ian Gibson Robin, F R C S , to Sheilagh Marian Croft

SMITH—BELL —On July 19, at St Mary's Church, South Kensington, H S Cunningham Smith, M R C S , to Rosemary Bell

DEATHS

COOK —On July 22, Herbert George Graham Cook, C B E , M D Lond , F R C S , of Cardiff

COOKE —On July 20, William Edmund Cooke, M D Lpool, F R C P , of Wigan

MARETT —On July 22, Philip Janvrin Marett, M R C S , lieut.-colonel R A M C (retd)

MARRIOTT —On July 21, at Leicester, Cecil Edward Marriott, M Chir Camb , F R C S

POTTS —On July 23, at Birmingham, William Alexander Potts, M.A Camb , M D Edin , M D. Birm

ROBERTSON —On July 18, at Storrington, John Robertson, M A. Edin , M D Lond , aged 76

TAYLOR —On July 17, at Edinburgh, James Anderson Taylor, M A St And , M D Edin , late of Dunkeld

VALLANCE —On July 21, at Lewes, Herbert Vallance, M R C S , aged 73

YOUNG —On July 23, at Glasgow, Archibald Young, T D , B Sc , M B Glasg , F R F P S G , regius professor of surgery in the University of Glasgow

N B —A fee of 7s 6d is charged for the announcement of Births, Marriages, and Deaths

STERNAL PUNCTURE —Prof. John Plesch (London, W.1) writes " In his article in your issue of June 17 on this subject Dr. Martin Hynes gives a brief survey of the history of bone-puncture May I point out that in 1906 there appeared an article in No 18 of the *Deutsche medizinische Wochenschrift*, under the title 'Probebohrung als Diagnostisches Hilfsmittel,' describing the method and its purposes ? "

The fourth annual general meeting of the Ethical Pharmaceuticals Association was held in London on July 14, with Mr. A W Edwards, the chairman, presiding, who, in the course of his report, announced that three more firms had joined the association during the past year He urged the importance of increasing the membership of the association still further if it was to play its part both in registering opposition to retrograde and unfair proposals and undertaking constructive measures on its own initiative in the interests of medicine and pharmacy in general and its own members in particular.

" . The Universities have unconsciously done an ill-turn to the service of biology as a national asset by favouring research at the expense of school teaching, the best men are usually guided into the paths of scientific investigation, and second raters are often looked upon as good enough for the services of scientific education and the investigations it so badly needs Yet if there is any situation that requires re-examination in the nations today, it is the chasm between scientific progress and the knowledge and spirit to use that progress solely for the benefit of mankind No certain method of bridging this gap is evident. But any reasonable suggestion is worthy of trial, and if, as has been suggested, the national teaching of biology is likely to create a scientific attitude of mind such that appreciation of the social and moral implications of science becomes second nature, then the best men and women are not too good for a task upon which may depend the ultimate progress of humanity."—*Nature, Lond* July 22, 1939, p. 130

ADDRESSES AND ORIGINAL ARTICLES

VISCERAL NEUROSES

By JOHN A RYLE, M D Lond, F R C P

REGIUS PROFESSOR OF PHYSIC IN THE UNIVERSITY OF CAMBRIDGE, CONSULTING PHYSICIAN TO GUY'S HOSPITAL LONDON

I*

An invitation to lecture before this College compels a considered selection of subject, title, and material which may in itself be held worthy of brief analysis In my choice of subject I have been influenced partly by developing personal interest and by the nature and quantity of the material within my reach, and partly by a desire to examine accumulated observations in such a way as to clarify my own thought and, where possible, to assist the thought and practice of others I have always preferred the appeal of familiar phenomena to the excitation of the strange or rare, and rightly or wrongly, but as time and the opportunity of a physician's life dictated, have set my training in recognition, description, and classification before the call to intimate or particular research In my clinical philosophy the general human problem and the special pathological problem, alike only in their complexity, have claimed, if not the same attention at least an equal regard The title of these lectures is borrowed from a distinguished predecessor at Cambridge, one of our own most scholarly Fellows, the late Sir Clifford Allbutt In 1884 Clifford Allbutt gave his Goulstonian lectures on the Visceral Neuroses Many besides myself must have enjoyed and often re read the slender booklet in which they were later published The fifty five years which have since passed have witnessed great advances in the methods open to us for the objective study of the normal and morbid physiology of the viscera, and, although many of Allbutt's observations are as sound and instructive today as when they were first written, others would require revision in the light of our newer and more precise knowledge Although his understanding of men, women, and temperaments may still serve to correct our over-mechanistic interpretation of certain visceral disturbances, modern chemistry, radiology, and endoscopic technique, had they been then available, would certainly have traced some of his 'neuroses" to an organic defect

But we have advanced not only in the realm of objective physical inquiry, for psychology too has begun to assist the elucidation of bodily disords in a more methodical way Moreover, those peculiar humoral disturbances now commonly called allergic are today regarded as capable of influencing other structures besides the bronchioles and the skin In the scientific field the fundamental contributions of two great physiologists, Pavlov and Cannon, have thrown light in dark places and given us explanations and experimental proof of numerous phenomena which clinical study alone could never have unravelled

It seemed to me therefore, that the time was ripe for a reconsideration of Allbutt s problem If I do no more than point the way to a clearer classification and understanding and a better diagnostic of the functional misdemeanours of certain organs my observations may yet serve a useful purpose and suggest fresh lines for future study

My information has been mainly culled from the files of my private cases Intimate personal histories, adequate family histories, careful symptom-analysis, and a systematic exclusion of organic possibilities are a necessary preliminary to the diagnosis of the visceral disorders These evidences are better obtained in the atmosphere of the consulting room or the sick room than in a ward or outpatient department It is probable too that the visceral neuroses are of more frequent incidence in those classes which do not earn their livelihood or control their homes by manual labour Furthermore, the disability accompanying a visceral neurosis, although often prolonged and considerable, is not as a rule so severe as to call for admission to hospital Writing of the colonic neuroses Hawkins (1936) said "Intestinal neuroses diminish in frequency as we descend the social scale" The same can be said of the other visceral neuroses, although allowance must always be made for the greater frequency with which the prosperous classes seek medical advice and for their better aptitude for describing symptoms

NATURE AND DEFINITION OF VISCERAL NEUROSIS

The visceral neuroses may be held to embrace those disorders of visceral movement, secretion, or sensation which occur in the absence of organic disease I shall not include in my category mere *anxiety about an organ* in the absence of good evidence of such disorder It is not rare for patients to present themselves in a state of anxiety about an organ on account of symptoms having no connexion with it, or because a suspicion of disease affecting it has been created by the remarks of friends or an unwise medical opinion Although, therefore, anxiety may and often does cause or contribute to a visceral neurosis, and although a visceral neurosis may in turn maintain anxiety, the concept of such a neurosis should include some real disturbance of visceral function To make our meaning more precise we must also exclude the operation of remote as well as local organic disease, for disease in one viscus may propagate nervous impulses which disturb the function of another viscus, and blood states or structural disease of the central nervous system may be expressed by disorders of function in one or more of several intact organs Of such disorders the dyspepsia (as distinct from the primary gall bladder pain) which accompanies cholecystitis, the cardiac dysfunction of anæmia, and the vomiting of tabetic crises are familiar examples.

All the functional disorders of the hollow organs which we have in mind can, broadly speaking, be regarded as due to an interference with the nervous regulation which derives from the sympathetic and parasympathetic systems and controls the rhythm, quality, and quantity of the contractions in plain muscle and the secretions, blood supply, and sensations of these organs We must further refine our concepts when we come to consider dysfunction due to chemical stimulation Such stimulation must be accompanied by local metabolic change although not by organic disease in the sense of persisting tissue modifications, the avoidance of which is probably due to the counteraction or reversibility of a chemical change Chemical stimulation may be exogenous, as in the case of foods poisons, and drugs, or endogenous, as in the case of the secretions of the pituitary or the suprarenal glands We also accept, on the basis of the researches of Loewi and Dale and their co workers, that the nervous impulse

* The first Croonian lecture delivered at the Royal College of Physicians on May 18 1939

itself, however initiated, is associated with a chemical discharge

Now, it is a remarkable but frequently confirmed observation that certain clinical phenomena, such as angioneurotic œdema and bronchial spasm, can be precipitated, on the one hand, by emotional causes, which presumably operate through the nerves, and, on the other, by an inhaled, ingested, or injected foreign protein, which presumably operates through the tissue fluids. So specific in type are these clinical or biological responses, that it is difficult to believe that the determining stimuli in the two instances are widely dissimilar. In other words, whether we regard certain disturbances (among which we may come to include some of the hollow-organ neuroses) as due to emotion or to allergy or sometimes to one and sometimes to the other, we can simplify our ideas by supposing in each case the immediate influence of a similar or identical chemical stimulus. A nervous subject is sometimes but not necessarily shown to be sensitive in the allergic sense. An allergic subject is frequently, perhaps, but not always shown to be sensitive in both senses. His sensitiveness may be increased or conditioned in many new ways with the passage of time. The immediate or determining stimulus, however, for his particular clinical or biological response may for the present be presumed to be specific and chemical.

Finally, in so far as pharmacological counteraction of the visceral or vascular phenomena of emotion or of allergy is possible, we find that certain well-defined substances, such as atropine, eserine, and ephedrine, are the most effective. There are observations available, as Gaddum (1938) and Fraser (1938) have lately reminded us, which suggest that the influence of these substances is intimately related with the interactions of certain endogenous substances now held to be the chemical determinants of the local muscular reaction to a nervous impulse. These substances include adrenaline with its counteragent amine oxidase and acetylcholine with its counteragent cholinesterase.

Briefly we are coming nearer to an understanding of clinical symptoms (or biological responses) variously and loosely attributed in the past to nervousness, idiosyncrasy, and allergy. Whether we include these responses under the generic title of "neuroses" or invent a better name for them, we are finding experimental and clinical justification for considering them together and not separately and for regarding them, however originated, as dependent on specific physiological disturbance rather than hypothetical nervous influence or structural change With very rare exceptions the responses themselves, however frequently and for however long a period they may be repeated, remain uncomplicated by secondary structural change, for the most careful examination of the organs and tissues concerned reveals no lasting abnormality. In each episode, in fact, the eventual counteraction of an excessive chemical stimulation is complete and perfect

Analogies have been drawn between the visceral neuroses and stammering Sir James Paget (1879) in a classical paper on "Stammering with other organs than those of speech," in which he discusses the neuroses of the bladder in particular, wrote: "Stammering, in whatever organs, appears due to a want of concord between certain muscles that must contract for the expulsion of something, and others that must at the same time relax to permit the thing to be expelled" The result, as with the speech stammerer, is inhibition or disorderly action with distress or, in the case of some viscera, actual pain

The victims of visceral stammering are of kindred temperament with the speech stammerers. Visceral and speech stammering not infrequently occur in the same person. Again and again we can trace the symptoms of the visceral neuroses to a failure of relaxation or to a too precipitate contraction of plain muscle, or to a loss of the normal tonic or peristaltic habit Kennedy and Williams (1938) have also drawn attention to the association of stammering and the allergic disorders. From this we must rather conclude that there is an association between nervousness and allergy than that stammering is an expression of allergy. The terms "vagotonia" and "sympathicotonia," associated with the names of Eppinger and Hess (1917), sought to explain liability to many of the visceral disturbances, but I am not satisfied that a simple separation into these reactive types is clinically justifiable.

FUNCTIONAL AND ORGANIC

In considering, as we shall later do, the individual nature and symptomatology of the visceral neuroses it should be emphasised that, although generally distinguishable by careful clinical analysis, they can and do imitate organic disease sufficiently closely to lead again and again to erroneous diagnoses The recognition of a visceral neurosis depends largely on the recognition of its subjective phenomena, and we would here do well to remind ourselves that all subjective symptoms, whether due to structural disease or other physical cause or to nervous or chemical unrest, express only a disturbance of function, and that a similar disturbance of function may result from any one of these causes. A symptom, in other words, is specific for a disturbance of function and not for its cause. A carcinoma or a nervous spasm may each cause colonic pain; in both instances the pain accompanies abnormal tension, perhaps with attendant ischæmia, in the muscle-fibre. Cardiac pain may be due to emotional stimuli, to anæmia, or to sclerosis of the coronary arteries; in each of these instances we believe the pain to be related to chemical disturbance arising from anoxia in the cardiac muscle-fibre.

To call an organic disease functional is an old and regrettable error. It may be as grave an injustice to a patient to call a functional disease organic. It is melancholy to contemplate the countless abdominal operations which have been performed and the countless physical treatments which have been prescribed in the past for disorders affecting the stomach, the bowel, the heart, the uterus, and other organs, which are no more "organic" than bronchial asthma, extra-systoles, blushing, or blepharospasm.

Differential diagnosis must be decided partly, it is true, by the quality and degree of a subjective symptom, but partly also by associated phenomena, and by temperamental assessments and routine objective tests Without a physiological interpretation of symptoms, however, all diagnosis remains incomplete

HISTORY AND LITERATURE

To attempt to combine a condensation of personal experience with an adequate digest of the scattered literature of so wide a subject as the visceral neuroses would be a difficult task. In a large but compact volume running into 430 pages and with a bibliography of 150 pages Dunbar (1935) has lately reviewed and abstracted the literature relating to the psychosomatic disorders covering the period 1910–30. Of this literature a considerable proportion is concerned with the emotional disturbances of the viscera, but it must be allowed that the advancement of knowledge

in a clinical regard within that period and since has been neither very methodical nor very extensive Cannon and Pavlov have given us basic knowledge and a host of fruitful ideas, but these have not influenced contemporary medical thought as they should have done

In recent years important observations on the influence of the emotions on the organs have been made by Wittkower (1935) and his collaborators, who have employed psychological experiment in conjunction with physiological and radiological studies and the psychiatric approach More attention, however, is paid at present to the psychology and psychiatry of these disorders than to their morbid physiology, their symptomatology, and their differential diagnosis from organic states Careful description and differentiation should surely anticipate or at least accompany therapeutic innovation Where psychiatry will be as liable to failure as the therapeutics of the physical school is in its omission to study the type or mode of the physiological disturbances consequent upon emotion Furthermore it has not been sufficiently emphasised that numerous factors other than emotion may contribute to the establishment and perpetuation of a visceral neurosis

Perusal of the literature and contact with the practice of the last quarter of a century reveal stages of thought and changes of fashion in which sometimes the organ, sometimes the nervous system, sometimes a mechanistic, sometimes an infective, emotional, or chemical hypothesis has focused attention for the time being Terms such as "vagotonia" or "organ inferiority" have replaced local pathological concepts such as "colitis," and in the field of treatment surgical trial and error and other physical measures are making way for psychiatric experiment With patient winnowing wheat may, it is true, be found among the chaff of much vague and unsatisfactory pathology From close clinical study, however, and from such study alone, emerges the prime necessity of observing and investigating the "whole man" if we are to reveal the pathogenesis and paint the true picture of a visceral neurosis and effectively to assess, for purposes of understanding and management, the contributions of heredity, temperament, physique, environment, emotion endocrine dysfunction, allergy, and the conditioned reflex Together with such study, and not separately from it, we should seek, whenever possible, to employ such special methods as physiology and psychology can prove to be effective

CRITERIA OF ALLERGIC PHENOMENA

In describing some of the visceral neuroses I shall have occasion as already indicated, to consider the possible contribution of natural sensitivity or allergy The list of manifestations attributed to allergy has already been unduly expanded Many of the newer additions have been made with little justification The term itself is providing a new cloak for ignorance I suggest that no visceral, cutaneous, or vascular symptoms should be held to be allergic unless some, and preferably several, of the following postulates are fulfilled

(1) The symptoms should bear close comparison with symptoms observed in human anaphylaxis or serum-sickness

(2) There should be a history of "idiosyncrasy" in respect of some food, beverage, tobacco drug or other extraneous substance or a well defined response to specific cutaneous tests

(3) There should be observed in conjunction with the suspect phenomenon, whether coincidentally or at other times, other accepted allergic phenomena, such as asthma, hay fever, urticaria, and angioneurotic œdema

(4) There should be a family history of these disorders

(5) The disturbances should show some such intermittency or periodicity as obtains in these disorders

(6) Every care should have been taken to exclude the presence of irreversible structural disease

(7) As additional tests Hurst (1933) mentions a favourable response to adrenaline and the presence of eosinophilia

The only final proof of allergic sensitiveness is a specific response to a specific allergen, but we must recall that this is by no means universally obtained even in such conditions as bronchial asthma and urticaria, hence its absence in other conditions need not be held to exclude them The clinical observations reported hereafter suggest that we have latterly, in our clinical assessments, attached too much importance to the idea of specific sensitivity, and that the so called allergic response is only one of many expressions of a hypersensitiveness to adverse stimuli (whether physical, chemical, or psychological) which attaches to certain types of human constitution It is a common observation that the same individual may manifest the same intestinal intolerance to a food-stuff, an east wind, fatigue, or a mental problem Angioneurotic œdema, although it may be induced by a bee sting or the injection of a serum, is often evoked by emotion The general and nervous health or balance of the individual at the time of exposure to an adverse stimulus may also determine the appearance or non appearance of the specific response, much as other forms of reflex activity may be heightened or diminished by an attendant but unrelated circumstance Nervous unrest and allergy are often partners, both may be capable of evoking the same symptoms in the same patient, but it remains for us to discover the nature of the relationship and the reason for the similarity of their effects The primary evidence for these statements is to be found in the daily experience of the clinic, the final explanation of the observed phenomena will only be attained by experimental methods

SCHEME OF INQUIRY

I propose to confine myself to a consideration of functional disorders affecting certain of the hollow organs Of the solid organs the liver particularly may also have its nervous disturbances, but these have not yet acquired clear definition, the nature of the disturbances is uncertain they are rarely painful affections or locally manifest, and they seldom lead to serious misinterpretations Nor shall I consider the respiratory neuroses Asthma is too large a subject Other disturbances of respiratory rate or rhythm under the influence of the emotions are scarcely visceral in the true sense Of the hollow organs I shall review in turn the gullet, the colon, the rectum, the urinary bladder, and the heart The uterus for lack of special knowledge, although its spasmodic neuroses are well known, I have left out of account Omission of the stomach may seem a peculiar decision, but I have to confess that, although much of my time and thought have been devoted to gastric physiology and pathology, and although gastric neuroses are common enough the difficulties of separating them from organic states, from associations of organic change with functional super additions (including the effects of atrophigy), or from reflex disorders of gastric function due to organic disease in neighbouring structures remain so considerable that I have preferred to concentrate on other viscera Alvarez (1940) in America, with his sensible physiological approach, has made valuable contributions to

the clinical study of the gastric neuroses, but they await a more intimate investigation. The organs chosen for consideration in these lectures are less liable than the stomach to inconspicuous inflammations and ulcerations and to reflex disturbances and can be more certainly passed as free from organic defect by modern methods of investigation. We shall, perhaps, be in a better position to segregate the gastric neuroses when gastroscopy has added to radiology and chemical analysis a more direct and reliable knowledge of the living mucosa. In the meantime the principles which should govern their clinical study differ in no essential from those to be described in the case of other organs.

The descriptions and discussion which follow are based upon a perusal of the records of 33 cases of œsophageal neurosis, 321 of colonic neurosis, 15 of rectal neurosis, 2 of serious bladder neurosis (the minor neuroses of the bladder being too numerous for analysis and not separately indexed in my files), and 63 of cardiac neurosis Many of the descriptions will be familiar; others may seem to have gained something through added detail and a closer symptom-analysis than is usually accorded them Among the visceral neuroses some are of indefinite type and some of more constant pattern. It is with the second group that my descriptions will be chiefly concerned The more constant the clinical pattern the more likely is it that we are confronted with a specific physiological error To attempt an analysis of the indefinite types of visceral neurosis would scarcely as yet prove a fruitful labour. In classifying results I debated at first whether it would be better to take each organ separately and to consider its important neuroses or under the several ætiological headings to consider examples of various visceral manifestations. The more I considered my case-histories the more pronounced became their ætiological complexity, even though competence for the recognition and sifting of likely causal factors in the individual may be allowed to have increased with experience It was also clear that different stimuli repeatedly caused or appeared to cause the same response. For these reasons and because anatomical classifications in medicine still have their uses the first plan appeared the only reasonable one to adopt. Brief mention will be made, in passing, of organic states which may be confused with the neuroses and particularly certain states which have recently been given distinctive portraiture by improved methods of objective study. Multiple neuroses often coexist in the same patient and are among the best evidences of a general or emotional cause To these associated neuroses frequent reference will be made

ÆTIOLOGY

Certain general ætiological considerations must claim our attention before the particular neuroses are passed in review When a patient presents himself with a complaining organ, when no evidence of structural change in that organ is forthcoming, and when symptom-analysis and the circumstances of his life and temperament suggest that he may properly be regarded as a victim of a visceral neurosis, diagnosis in the full sense still remains incomplete until we can suspect an exciting stimulus and have obtained demonstration or at least framed a reasonable physiological explanation of the mechanism of the neurosis Clinical, radiological, and other objective investigations have done much to explain the morbid physiology of the hollow organs and can discover or exclude organic states with increasing certainty. Intimate clinical histories and hypothesis based upon them and strengthened by the work of Cannon and by Pavlov's classical experiments on the conditioned reflex can at least carry us a stage further in the study of ætiology and may at present be held to justify the following conclusions in regard to the origins and perpetuating causes of the visceral neuroses.

(1) The origin of a visceral neurosis may be found in a previous but finally departed organic injury. Thus a past dysentery may leave in its wake a spastic or irritable colon, or a cystitis be followed by a nervous frequency In similar fashion a bronchitis is sometimes succeeded by asthma, or a conjunctivitis by habitual blinking "Conditioned irritability" would, perhaps, be an apt definition of such a neurosis. In each example quoted the local inflammatory irritation has passed, but the habit of irritability remains. In each example a central or peripheral irritation, sometimes minimal and often far to seek, is required to determine the active dysfunction.

(2) The origins of a visceral neurosis may be found in an inborn, or more rarely an induced, sensitiveness or allergy In such case the "irritability" is conditioned by a "humoral" instability, while the active dysfunction is determined by specific stimuli. As with asthma, however, the passage of time may result in a more ready determination of attacks by both old and new stimuli The sensitiveness becomes less specific The active irritation, as distinct from the irritability, is determined in new ways As will be shown, colonic and rectal neuroses, which are sometimes associated in the same individual with asthma, urticaria, hay-fever, or migraine, can rarely be traced to a single specific cause.

(3) The origins of a visceral neurosis may be found in a psychological instability unassociated with the conditioning factors named above but manifest as anxiety or other emotional unrest. Prominent among the perpetuating factors is the patient's fear that the visceral symptoms may be due to organic disease

(4) As with bronchial asthma, so with the disorders of the abdominal viscera any or all of the provocative factors named may operate simultaneously or at one time or another in the same individual and may serve as reinforcing stimuli. A humoral state may provide the condition for an emotional reaction, or an emotional state for a humoral reaction An asthmatic tendency based on a native allergy, and the asthmatic attack itself due primarily to pollen or some other specific factor, may, as the years pass, undergo aggravation or be occasioned by a variety of other factors, physical or psychological, and including dust, fatigue, locality associations, or emotional repressions A similar evolution may eventually be found to be true for the neuroses affecting the abdominal viscera.

(5) Whatever conditioning or determining causes we invoke, we have good reason to suppose from studies of temperament, physique, and family history that hereditary predisposition is a main foundation upon which the visceral neuroses are based Both conditioning and determining extraneous stimuli—e.g., a past inflammation or present irritation—operate frequently but with little or no effect in persons lacking the nervous or humoral predisposition or diathesis In most cases of visceral neurosis there is a history of nervousness on one or both sides of the family The inherited tendency or diathesis is best regarded as a biological variation Variations may be observed in degree as well as kind Correlated variations, here as elsewhere in nature, are common

(6) Finally (although such cases cannot strictly come within our category) an organic state incapable

of producing symptoms under favourable conditions may, in the presence of anxiety, lead to visceral disorder Thus, I have seen achalasia of the cardia with pronounced œsophagectasia causing small inconvenience in quiet times or even under the crudest dietetic conditions in times of holiday, but under the worrying conditions of professional life, domestic infelicity, or international crisis occasioning a return of the usual troublesome dysphagia and regurgitation Anxiety may also perpetuate angina pectoris, which will again disappear with relief of mind, even though we have good reason to suppose that the primary basis of the pain was organic coronary artery disease

I have thought it well to formulate these views relating to etiology in advance of the evidence on which they are based This evidence has been sought and must be sought again in clinical experience which constantly checks and modifies its own conclusions, in the frequent re-reading of case notes, and, where possible, by "follow up" inquiry I believe and shall hereafter support the belief that the classification of causes outlined above, although it may stand in need of fuller proofs, is a useful one, if only as an aid to the management of cases and as a reminder that the visceral neuroses are not all or wholly emotional in origin, not all or wholly implanted in allergic soil, and not all or wholly a consequence of physical factors in the shape of present or past organic irritation

The whole man and his environment will remain an essential part of the study of the visceral neuroses, whatever refinements of knowledge may accrue from physiological, biochemical, or psychological inquiry

"The world of today is suffering from a crisis of disillusion and resentment against reason, simply because it believed too much in it before Human life can only stand one homeopathic dose of reason at a time In love with logical perfection, and also afflicted by the injustices and inequalities of everyday life, the men of the nineteenth century tried to force the pace of human progress by establishing the perfect society ruled by rationalist justice This noble effort was the dream of the French Revolution Under the Revolution itself human life turned with unheard of violence against the domination of rationalised logic, and the world saw this strange paradox the triumph of the most unbridled irrationalism in the name of the most rigid reason This affliction has gone on in various forms during the whole of the nineteenth century, and it is even today the keynote of many happenings, both large and small which we see around us But England never took part wholeheartedly in this rationalistic mania of our epoch However much she might be in love with ideas she always retained a certain reserve for the unexpected the errors of men, and the ways of unfathomable nature As an external and positive symbol of this attitude, England never gave the first place in her public life to the intellectual or the thinker But, actually because of that, the intellectual and the thinker still occupy the high place in England that they have always had, while one sees them dethroned and persecuted in countries that have suffered from an excess of intellectualism and where political advance was wont to be preceded by philosophical standard bearers"—SALVADOR DE MADARIAGA The Island of Commonsense,' in *The Listener*, July 20 1939, p 110

ENCEPHALOMYELITIS FOLLOWING ADMINISTRATION OF SULPHANILAMIDE

BY J H FISHER, M B Sydney, M R C P.

A MEDICAL CHIEF ASSISTANT AT THE ROYAL INFIRMARY, MANCHESTER LATE MEDICAL REGISTRAR AT THE SOUTHEND ON SEA GENERAL HOSPITAL

With a Note on Histological Findings

BY J R GILMOUR, M R C P

JUNIOR ASSISTANT DIRECTOR OF THE BERNHARD BARON INSTITUTE OF PATHOLOGY, LONDON HOSPITAL

NUMEROUS toxic manifestations are known to have followed the use of sulphanilamide Many of these are not serious, for example cyanosis, dermatitis, febrile reactions, nausea, vomiting, and enteritis Others, which are uncommon but more important, are anæmias, agranulocytosis, and hepatitis Their cause seems to be an idiosyncrasy to the drug, for they develop very rarely, and often after only small amounts of the drug have been taken Toxic effects on the central nervous system have seldom been recorded In the two following cases symptoms of encephalomyelitis appeared after administration of small quantities of sulphanilamide

The First Case

A woman of 33 was admitted to the Southend on Sea General Hospital on Sept 7, 1937

History.—Four years previously she had begun to suffer from arthritis of the fingers, ankles and knees, and for this she was treated with gold injections Six months later she developed lupus erythematosus

Examination.—The lupus erythematosus affected chiefly the nose, face, ears and back of the hands The rheumatoid arthritis involved the fingers, wrists, knees and ankles, and she complained of pain in the affected joints There was moderate anæmia, the blood-count being:—

Red cells	4 096 000	Polymorphs	70%
White cells	5700	Lymphocytes	26%
Hæmoglobin	65%	Large mononuclears	4%
Colour-index	0 8		

Progress.—The temperature rose occasionally to 99° or 100° F On Sept 28 treatment with sulphanilamide was started, and she was given 0 5 gramme twice daily Even on this small dose she became cyanosed on the second day, but as she was in no way distressed, administration of the drug was continued On Oct 11 the temperature rose to 101 5° and she had a slight headache Next day the temperature was 104° and the headache more severe The drug was stopped Two days later (Oct 14) she suddenly developed complete flaccid paralysis of both legs, her neck was a little stiff, the knee- and ankle-jerks and the abdominal reflexes were absent, and the plantar reflexes were not elicited Sensation for light touch was lost up to the level of the iliac crests, and sense of position in the feet was also lost; but pain and vibration sense remained

The cerebrospinal fluid (C S F) removed on Oct 14 was turbid and under increased pressure Cells 16 000—almost all polymorphs, with a few red blood-cells Protein 100 mg per 100 c cm Chloride 660 mg Globulin, marked excess No tubercle bacilli seen, and culture sterile Leucocytes 4700 (polymorphs 70 per cent, lymphocytes 27 per cent, large mononuclears 2 per cent, eosinophils 1 per cent)

On Oct 15 sensation was completely lost up to the level of the fifth thoracic segment, and retention of urine developed On the 17th the anæsthesia had ascended to the second thoracic segment and there was consolidation at the bases of both lungs She died on the 18th.

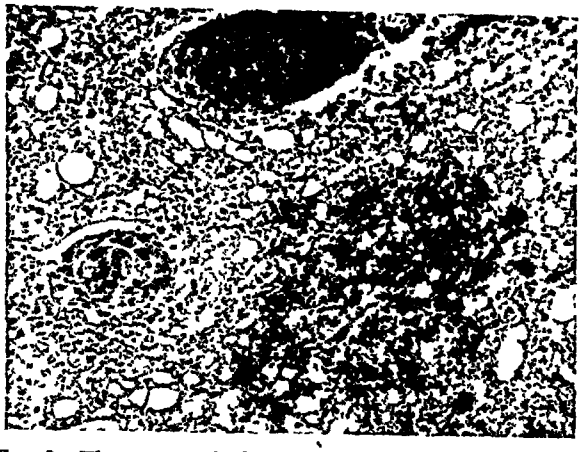

FIG. 1—*Thoracic cord. Hæmatoxylin and eosin.* Thrombosis of two small vessels and a hæmorrhage in white matter. (× 115.)

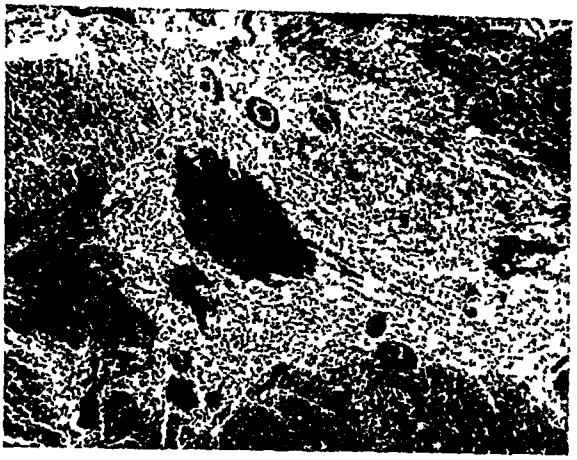

FIG. 2—Thoracic cord Loyez Hæmorrhages in substance and in sheaths of vessels in grey matter. (× 30)

Post-mortem examination.—There was hypostatic pneumonia of both lungs, with caseating hilar glands. The liver showed chronic venous congestion, with caseating glands at the hilum. The lumbar region of the spinal cord was softened and diffluent. The thoracic cord showed injected vessels and minute streaked hæmorrhages.

HISTOLOGY OF BRAIN AND CORD

(DR. GILMOUR)

Sections were made from the following tissues received in 4 per cent. formaldehyde. cerebral cortex, 3 portions; cerebellum, 1 portion; medulla, 2 portions; spinal cord, 4 portions (1 upper cervical, 2 thoracic, and 1 lumbar). Paraffin sections prepared from all the tissues were stained with Ehrlich's hæmatoxylin and eosin, Weigert's iron hæmatoxylin and van Gieson, Hart's modification of Weigert's elastic method, and Loyez's method for myelin. Frozen sections were stained by Herxheimer's method. Weigert-Pal preparations were made from one of the thoracic portions of the cord.

The *medulla*, two portions of the *cerebral cortex*, and the *basal ganglia* were normal histologically. There was a very slight desquamation of leptomeningeal cells forming round free cells with abundant cytoplasm in places on the surface of the cerebellum, and in the depth of a sulcus in the third portion of the cerebral cortex. These are of doubtful significance.

In the *upper cervical cord* a few lymphocytes and round leptomeningeal cells were present about a few veins in the leptomeninges.

In one portion of the *thoracic cord* three small veins in the leptomeninges showed recent thrombosis Some round leptomeningeal cells were present about vessels in the anterior fissure, and associated with some lymphocytes also in the adventitia of vessels in the posterior median septum. Three small vessels in the white matter were thrombosed (fig. 1 illustrates two of these) Fibrin was precipitated in a few, and hæmorrhage was present (fig. 2) in many Virchow-Robin spaces. All vessels in the cord were congested One showed necrosis of its wall (fig. 1). Many scattered minute hæmorrhages were to be seen in both grey and white matter (figs 1 and 2). The peripheral white matter in many places showed great ballooning of myelin sheaths by a clear fluid-like substance (fig. 3) The grey matter was slightly shrunken and œdematous, and the bodies of the neurones were usually very degenerate, and many had disappeared. Slight proliferation of rounded microglia cells was seen in the grey matter, and about some vessels in the deeper parts of the white matter. There had been some loss of myelin in the ballooned areas, in the grey matter, and about the vessels in the deeper white matter (figs. 4 and 5).

The other portion of the thoracic cord and its meninges were congested. Fibrin was present in a few, and hæmorrhage in other Virchow-Robin spaces in the cord. Œdema, and degeneration and loss of many bodies of neurones were evident in the slightly shrunken grey matter. There was much ballooning of the peripheral white matter. In the grey matter, and around vessels in the deeper white matter, many rounded microglia cells were noted. The subarachnoid space was filled with crushed and softened cord substance which had come from the lumbar region during the process of removal of the cord. In frozen sections one or two fat granule cells were present in the adventitia of a few vessels in the cord.

The *lumbar cord* was collapsed from loss of much of its substance, and the pia was wrinkled. A small artery in the pia showed fibrinoid necrosis, thrombosis, and slight leucocytic infiltration and fibrin deposition in the adventitia A few veins in the leptomeninges showed recent thrombosis. There was frequently slight lymphocytic and leucocytic infiltration or hæmorrhage in the adventitia of the congested vessels within the cord. Some vessels showed necrosis and slight leucocytic infiltration of their walls. The cord substance was greatly reduced in amount, fragmented and structureless. There was hæmorrhage in a spinal nerve-root. Much fragmented structureless cord tissue was present in the subarachnoid spaces, derived from the cord by trauma during its removal.

The pathological changes consisted of softening of the cord substance, and various vascular lesions. The latter consisted of congestion, hæmorrhages, and thrombosis in small arteries and veins, and fibrinoid necrosis of the walls of small vessels The softening was shown by ballooning of the myelin sheaths in the superficial white matter, proliferation of rounded microglia cells and demyelination around some vessels in the deeper white matter and in the œdematous slightly shrunken grey matter, and by the loss of many bodies of the neurones. This was seen in the thoracic region, but softening had been so marked in the lumbar region that the tissue was semifluid, and readily escaped into the subarachnoid space during removal of the cord.

The Second Case

A woman of 28 was admitted to the hospital on Nov. 4, 1937, complaining of painful red swellings on the legs.

History.—For ten days she had had sore-throat, generalised aches and pains, sweating and fever.

There was no swelling of joints On the day before admission she developed raised red tender spots on the front of both her legs Her past illnesses included rheumatic fever and frequent attacks of tonsillitis

Examination —Temperature 102° F Acute follicular tonsillitis, and moderate bilateral cervical adenitis Numerous scattered lesions of erythema nodosum on the front of both legs Heart and chest normal Cranial nerves normal, knee jerks, ankle-jerks, and abdominal reflexes present, plantars flexor

Course of illness —After five days' treatment with salicylates the temperature became lower and the lesions less conspicuous On Nov 9 treatment was commenced with sulphanilamide, 1 0 gramme thrice daily, and slight cyanosis developed after twenty four hours On the 14th, after six days' administration of the drug, her temperature rose to 103°, and there was a fresh extension of the lesions of erythema nodosum She complained of severe headache and vomiting, and there was severe shooting pain in the right leg, which showed slight muscular weakness The cranial nerves were normal, the knee-jerks and ankle-jerks were much exaggerated, there was bilateral ankle-clonus present, the abdominal reflexes were absent, and the plantar responses were flexor Lumbar puncture on the 14th produced a clear cerebrospinal fluid, normal on examination, and not under pressure

Sulphanilamide was stopped The temperature returned to normal after four days, and the headache and pain in the leg disappeared after a few weeks On discharge there was still some weakness of the right leg The abdominal reflexes were absent, the knee-jerks and ankle-jerks were markedly exaggerated, and there was still ankle-clonus on the right side

Discussion

In these two cases lesions of the central nervous system developed during treatment with sulphanilamide In case 1 the symptoms suggested an acute ascending myelitis, in case 2 the clinical findings were consistent with encephalomyelitis The out standing post mortem features of case 1 were the perivascular demyelination in the thoracic cord, the vascular damage, and the massive softening of the lumbar cord

(1) The *perivascular demyelination* is of particular interest, because it is the constant and essential lesion of postvaccinal and postinfectious encephalomyelitis and the encephalomyelitis occasionally seen after antirabic inoculations It has however also followed arsenic injections (Russell 1937), although here the commoner picture is a hæmorrhagic encephalitis without any perivascular demyelination

FIG 5—Thoracic cord Loyez Ballooning of peripheral white matter in places, perivascular demyelination in deep white matter, hæmorrhages in grey matter and amorphous debris in subarachnoid space derived from the lumbar region during removal of the cord (× 8)

(2) *Vascular damage* was prominent Minute scattered hæmorrhages were present, and there was thrombosis of small arteries and veins particularly in the leptomeninges, and to a lesser degree in the cord Some vessels showed fibrinoid necrosis and frequent slight leucocytic infiltration of their walls In postinfectious encephalomyelitis a few small thrombosed vessels are sometimes seen, but not inflammatory changes in the vessel walls of the kind here apparent A case with very similar pathological changes was described by Bram and Russell (1937) following the administration of a spinal anæsthetic There was massive softening of the cord extending from T12 to L2, and focal areas of demyelination, not related to hæmorrhages in the higher segments In the affected areas veins showed endophlebitis or thrombosis, while arteries showed kinds of acute necrosis or "necrotising arteritis" Similar vascular changes have been reported in encephalitis following arsenic injections (Scott and Moore 1928 and Baker 1935), although no destruction of brain tissue was noted

(3) *Massive softening of the cord* has been described in encephalomyelitis following smallpox (Troup and Hurst 1930), after antirabic inoculations (Babes and

FIG 3—Thoracic cord Loyez Ballooning of myelin sheaths in superficial white matter (× 75)

FIG 4—Thoracic cord Loyez Perivascular demyelination in deep white matter (× 75)

Mironesco 1908), and after spinal anæsthesia (Brain and Russell 1937, Brock, Bell and Davison 1936).

NOMENCLATURE

The term encephalomyelitis has been used in describing these two cases, but it is not used in any specific sense. The condition found has certain pathological features in common with recognised types of encephalomyelitis, but this does not necessarily mean that the lesions have a similar origin. In defining the alternative term "myelomalacia" Walshe (1937) says that it has been applied to localised softening of the cord secondary to diminished blood-supply, especially due to thrombosis of its blood-vessels, as distinct from local destructions which may result from inflammatory conditions But such a distinction, he holds, is not justified; for thrombosis and ischæmia are a part of the pathological process of all traumatic, inflammatory and pressure lesions of the spinal cord, and may be terminal events in certain diseases of the cord in which vascular lesions of the cord are otherwise conspicuous by their absence. In my case 1 the inflammatory changes in the vessel walls, and thrombosis of vessels, the perivascular demyelination, and massive softening, may all have been the result of the same damaging agent.

It is possible that the massive softening of the lumbar cord was secondary to vascular occlusion, but similar softening has been reported in encephalomyelitis following smallpox (Troup and Hurst 1930), when no thrombosis of vessels was seen Again in arsenic encephalitis perivascular demyelination has been described when no thrombosis of vessels was present (Russell 1937), while others (Baker 1935, Scott and Moore 1928) have recorded cases showing vascular damage and thrombosis of vessels but no softening.

TOXICITY OF SULPHANILAMIDE

Very few affections of the central nervous system attributable to sulphanilamide have been reported. Bucy (1937) described a case of toxic optic neuritis apparently to be explained by idiosyncrasy to the drug. A girl with osteomyelitis was given sulphanilamide three times. On the first two occasions she had headache, cyanosis, diarrhœa and a choking sensation, and on the third she developed a toxic optic neuritis after taking a single tablet. Whitby (1937), speaking of the toxicity of sulphonamide preparations, stated that one case where the central nervous system was affected had come to his knowledge. Several cases of neuritis have been described following the administration of Uleron.

Van Valkenburg and Kreuzwendedich von dem Borne (1938) reported a case of polyneuritis developing after 16 g. had been given in two periods with a week's interval.

Alder and Markoff (1938) described two cases of polyneuritis after administration of uleron

Schubert (1938) reports a case of a man, aged 21, developing extensive softening of several segments of the thoracic cord after the administration of 15 g. of uleron, and later 15 g. of Diseptal B, with six days' rest between the courses. He appeared to be completely cured at the end of the course, and the symptoms of myelitis did not begin until fourteen days later. He had a fall while ski-ing, and sprained his knee. The next day he noticed numbness of the feet and weakness of the knees. It was considered that the fall was probably a factor in precipitating the lesion, but was not wholly responsible for it. The cerebrospinal fluid did not contain any blood, and there was no bony lesion, and nothing was found post mortem to suggest it could have been traumatic in origin. The gonococcal infection appeared to have cleared up completely.

It appears that patients suffering from lupus erythematosus and arthritis, and from acute rheumatism, are especially susceptible to the toxic effects of sulphanilamide.

Barber (1937) reported two cases in women with lupus erythematosus and arthritis. The first developed fever (102° F.) and diarrhœa, after taking 1·0 g. t.d.s. for ten days, and the second developed toxic symptoms after taking 0·5 g. t.d.s. for ten days. After a rest from treatment, another attempt to take the drug immediately provoked the same symptoms. Both patients seem to have become sensitised to the drug.

Swift, Moen and Hirst (1938), after treating 8 cases of rheumatic fever, concluded that its toxic action in this disease outweighs any benefit obtained.

In both my cases the toxic effects, if due to the drug, must be ascribed to idiosyncrasy rather than overdosage. The first patient, with lupus erythematosus and arthritis, had a total of 14 g, and the second, with tonsillitis and erythema nodosum, had 18 g. There is evidence also that the encephalomyelitis following arsphenamine injections is independent of the dosage. Cormia (1936), studying the records of 135 cases in which encephalitis was a sequel to arsenic injections, found that it usually developed after the second injection. It is not due to a Herxheimer reaction, since it has been seen in non-syphilitic subjects (Globus and Ginsberg 1933)

An emulsion of cord from the fatal case was inoculated intracerebrally into a monkey and 2 guineapigs, 2 rabbits and 12 mice, with negative results, and this is in keeping with the fact that encephalomyelitis showing perivascular demyelination has never been transmitted to animals No known virus causes this pathological picture, and there is at present little to support the theory that the encephalitis is caused by activation of a virus latent in the body.

It is known that certain persons develop unusual reactions after taking small amounts of some drugs The toxic manifestations they show are not those usually seen in overdosage from the particular drug. The cause of the idiosyncrasy is unknown. Occasionally, the symptoms appear after the first dose, and there seems to be a constitutional factor. Often, however, they come on only after a number of doses, and here sensitisation to the drug seems to have taken place. Once they become sensitised, a minute dose of the drug will bring recurrence of the symptoms. It is possible that the encephalomyelitis following sulphanilamide and arsenic is the result of such a reaction affecting the central nervous system.

The possibility of postinfectious encephalomyelitis being due to sensitisation has been suggested.

Summary

1. Two cases of encephalomyelitis following the administration of sulphanilamide are described, one of which ended fatally. The total doses taken were small (14 g. and 18 g.) and if the drug was responsible the patients must have been more than ordinarily susceptible to it.

2 There is evidence that patients suffering from certain illnesses—including acute rheumatic fever and lupus erythematosus—are especially liable to develop toxic manifestations after taking sulphanilamide

3. Vascular changes are seen in some cases of encephalomyelitis and their relation to the demyelinating lesions is discussed.

I wish to thank Dr J R Gilmour for his report and for the photomicrographs, Dr L T Bond for performing the post-mortem examination, and Dr Arthur Burrows, Dr R Sleigh Johnson and Dr T Rowland Hill for permission to publish the cases The late Dr J R Perdrau carried out the animal-inoculation experiments

LOCAL TISSUE ANOXIA AND ITS TREATMENT

WITH SPECIAL REFERENCE TO RHEUMATIC MYOCARDITIS*

BY E P POULTON, D M Oxfd, F R C P
PHYSICIAN TO GUY'S HOSPITAL, LONDON

Local Tissue Anoxia

NOTHING is commoner in special pathology than to ascribe to ischæmia from arterial disease the fatty degeneration, necrosis, or fibrosis of organs Ischæmia presumably acts by producing want of oxygen (*local tissue anoxia*), and yet no one has examined this problem systematically by observing the effect of breathing a high concentration of oxygen over a long period, even though benefit might be expected from such treatment in suitable cases There are three reasons for this omission (1) The term *local* tissue anoxia implies normal saturation of the arterial blood with oxygen, otherwise all the tissues would be anoxic, the frequent use of the term anoxæmia for this condition has obscured the problem (2) Until the last few years there has been no convenient method of giving oxygen in high concentration for more than a few hours at a time, and it has been considered inadvisable (Boothby 1938) (3) Most important of all, it has been argued that, because the normal arterial blood is 95 per cent saturated with oxygen, no good would be obtained by completing the saturation to 100 per cent One well known author speaks of anoxæmia as the 'kind of oxygen want that is capable of relief by oxygen inhalation" as if the other kind could not be relieved in this way This is perhaps a fair presentation of the views of clinical workers in this field up to date, though, to judge from a lecture given on May 7 1930, by Dr W Lovelace at Guy's Hospital, some American opinion is fast coming round to the views advocated in this paper

There are observations proving that breathing oxygen can relieve local anoxia (1) Campbell and Hill (1931) and Line et al (1936) have shown that when man breathes oxygen nitrogen is driven out of the body and oxygen must presumably take its place, (2) Campbell (1925), after injecting air beneath the skin and into the peritoneal cavity of animals found that the partial pressure of oxygen in these collections of gas was increased by breathing oxygen (3) Behnke et al (1934) found that under high oxygen pressure the mixed venous blood contained more oxygen than there was in the arterial blood when the animal was breathing air, showing that the hæmoglobin had probably undergone no reduction at all as it passed through the systemic circulation, tissue respiration being carried out entirely by means of oxygen in solution, and (4) Krogh (1922) has pointed out mathematically that oxygen consumption in muscle depends on the difference between the capillary oxygen pressure and the tissue oxygen pressure and is least in parts removed from open capillaries, where there may be a temporary lack of oxygen Breathing oxygen must cause a rise in capillary oxygen pressure and facilitate the absorption of oxygen, as shown by Hill, Long, and Lupton (1924) during muscular work in man and by Hill and Flack (1909), who found that athletes were able to improve their performances Boothby (1938) has compared the volume of oxygen dissolved in the plasma when the subject breathes oxygen with that combined as oxyhæmoglobin, but volumes do not enter into Krogh's formula Oxyhæmoglobin is to be looked upon merely as a store from which the body obtains oxygen without too great a fall of partial pressure

CORONARY THROMBOSIS

Although there has been no systematic study of the use of oxygen in local tissue anoxia, observations are available in three instances· (1) Hill (1921) claimed that there was considerable improvement in two cases of chronic ulcer of the leg with local œdema, (2) it has been suggested that certain drugs —e g, alcohol and cyanide—act by preventing the cells from absorbing oxygen—"histotoxic anoxia'—and Barach (1934), among others, has shown that oxygen is certainly beneficial in acute alcoholism While admitting the benefit, some have doubted the anoxic hypothesis which would explain it, and certainly the fall in concentration of alcohol in the blood under oxygen (Robinson and Selesnick 1935) suggests another possible explanation—e g, an oxidation of the alcohol which is poisoning the cells It is desirable to obtain further proof that local tissue *anoxia can exist*

(3) *Coronary thrombosis* —Levy and Barach (1930) treated with success four patients in an oxygen tent, and I described benefit in one case (Campbell and Poulton 1934) The rapid cutting off of the arterial supply, the secondary infarction, and the intermixture of blood-clot and injured muscle fibres from subsequent hæmorrhage all suggest local tissue *anoxia* and the deviation of the S–T interval from the iso electric line in the electrocardiogram (E C G) provides a proof for this physical sign indicates local want of oxygen (Dietrich and Schwiegk 1933, *Büchner 1938*) *In spite of this, oxygen plays* practically no part in the treatment of this condition in this country It is not mentioned in many textbooks or in discussions at medical societies (*Lancet* 1939) It is because in my experience oxygen is the most valuable drug we possess for coronary thrombosis improving the heart's action and relieving pain that these further two cases are described

CASE 1.—A mess room attendant, aged 50, had had seizures 12 and 34 years ago and mild attacks for the last 20 years after hard muscular work The symptoms were nausea, dizziness, swelling of the chest (constriction) sweating, and weakness of the

* A paper read before the Association of Physicians

legs. On the present occasion he staggered to a bench and lay down, remaining conscious.

On admission to Guy's Hospital under Dr. R. T. Grant at 1 P.M. on Nov. 25, 1938, there was pain in the chest and a sense of dissolution; the radial pulses and apex-beat were impalpable; the heart-rate was 130 and the heart's action irregular. By 1.40 P.M. he was in a tent with 75 per cent. oxygen. When examined at 11.15 P.M. he was better, the heart-rate was 80, and the radial pulse was just palpable; blood-pressure 100/81, rising to 120/70 on the 27th and 140/90 on the 29th, when the tent was removed. There was a polymorphonuclear leucocytosis and variations in the P and T waves of the E.C.G. indicating coronary thrombosis. There was no S–T deviation, possibly because he was immediately treated with a high concentration of oxygen. He was discharged on Dec. 20.

CASE 2.—A lady, aged 82, had had a severe attack of what was evidently coronary thrombosis in about 1912 and anginal pains for the last two or three years, especially when walking against a wind. There were two severe attacks at night on Oct. 1 and 14, 1938. On the 16th the blood-pressure was 170/110. On the 23rd at 10 A.M. she had a severe attack of pain and was pulseless, and immediate death was feared. She was in a tent with 45–50 per cent. oxygen by 5 P.M. and stayed there for the night. She improved, her blood-pressure being 105/70. On the 24th the E.C.G. showed S–T deviation, most marked in lead 3, which was much less on Nov. 3. The other changes were compatible with the diagnosis.

For the next six months she had oxygen, mostly at night, with a tent or forked nasal tube. Its effect in raising the blood-pressure and relieving pain was observed many times. In February, 1939, the blood-pressure varied between 100/75 and 145/95, according as oxygen was given. In the day-time she led the life of an invalid but was wheeled out of doors and went for drives. The value of the tent over the forked tube was illustrated by her last severe attack of pain twelve hours before she died. She was unconscious, dyspnœic, and cyanosed after morphine, in spite of a flow of oxygen at 6 litres and later 8 litres a minute. As soon as the tent was applied with 70 per cent. oxygen, she became conscious and then had natural sleep for about six hours. According to present experience a higher concentration of oxygen and a longer continuous period in the tent at the outset are indicated.

LOCAL CEREBRAL ANOXIA

It will be evident, from what has been said so far, that local tissue anoxia may play an important part in clinical medicine, and its treatment with an "airtight" tent may produce on occasions brilliant results. The airtightness of the tent must be emphasised not only because oxygen is economised but also because a constant high percentage is more readily obtained. It would serve no useful purpose merely to enumerate those diseases in which on theoretical grounds this treatment might prove to be of value, without producing experimental evidence; this is a subject for future investigation. However, there is one condition I must mention before approaching the main subject of this paper. If coronary thrombosis causes local anoxia of the heart muscle, will not cerebral hæmorrhage, thrombosis, or embolism produce local anoxia of the brain, particularly since it is now recognised that the central nervous system has a high basal requirement of oxygen? So far I have treated half a dozen cases. More are necessary for the purpose of estimating the prognosis, with and without oxygen; but two of the cases show points in its favour.

CASE 3.—A girl in the Downs Hospital, aged 12, with rheumatic heart disease, had a sudden attack of aphasia and hemiplegia, which remained unchanged for four days, after which an oxygen tent was used; two days later improvement in speech was noticed, which continued in the tent.

CASE 4.—A fish-porter, aged 39, was admitted to Guy's Hospital on Sept. 28, 1938, semiconscious, with right hemiparesis; blood-pressure 210/130. He gradually became unconscious, and the paralysis increased till on the 30th he lay like a log. At 6 P.M. an oxygen tent (60–70 per cent.) was used. The next morning he came round sufficiently to want to sit up and could answer "yes" and "no." Incontinence was noticed. On Oct. 3 he was fully conscious and could move his right arm and leg. The oxygen was lowered to 40–50 per cent. at 5 P.M. The next day he was taken out of the tent, he could talk normally, the right side of his face was weak, but improved, and he was still doubly incontinent. He remained in statu quo till the night of the 10th, when he became worse. He had difficulty in speaking at 8 A.M. on the 20th and was restless and unconscious in the afternoon, when he was put back in the tent. He died at 6.45 A.M. on the 21st, and at autopsy there was a black organising clot obliterating the left internal capsule and no recent hæmorrhage. The improvement with oxygen, after the progress downhill during the first three days in bed, and the relapse from the effect of the original hæmorrhage fifteen days after removal of the tent both suggest that oxygen was valuable but was not used long enough.

Rheumatic Myocarditis

The points in favour of a local tissue anoxia in rheumatic myocarditis are as follows:—

(1) The histological picture of Aschoff node formation in the myocardium, so often described, has been epitomised as a panarteritis with thrombosis of the lumen in places and peri-arterial fibrosis (Gadrat 1938). Associated with this there is cloudy swelling, diffuse or in patches, later fatty metamorphosis of the muscle cells, and latest of all a dystrophic change, seen best in the auricular wall in mitral stenosis, where the muscle substance disappears, leaving a delicate web of sarcolemma. Coombs (1924), who described these changes, ascribed them to inflammatory toxins; but why should not they be due to anoxia secondary to the panarteritis?

(2) Asphyxia in cats causes lengthening of the P–R interval, missed beats, and 2 to 1 heart-block (Lewis 1925), conditions met with clinically in acute rheumatism, and recently the S–T deviation from the iso-electric line, which is also commonly met with in acute rheumatism, has been attributed to want of oxygen (Dietrich and Schwiegk 1933, Büchner 1938).

(3) Repeated small blood-transfusions are beneficial in rheumatic myocarditis (Horvath 1938), and these would increase the supply of oxygen in a disease characterised by a low hæmoglobin percentage.

LACTIC ACID

If there is anoxia of the heart muscle, an increased production of lactic acid would be anticipated. This might show itself in an increase of the blood lactic acid and/or of the amount excreted. An investigation took place at the Birmingham Children's Hospital, and Dr. E. M. Hickmans, biochemist to the hospital, has kindly allowed me to quote some of the conclusions. The patients were afebrile and in bed; 94 estimations of blood lactic acid at about 10 A.M. in rheumatic cases and 62 in controls were made by Friedmann's method and 26 in rheumatic cases and 11 in controls by the method of Avery and Hastings. The lactic acid of the urine was determined 103 times in rheumatics and 68 times in controls, usually for a period of twelve hours. The average percentage of lactic acid in the blood by both methods and in the

urine excreted in twelve hours and the range (highest and lowest figures) were the same in the two groups, but the distribution curves differed There were more high and low values for the blood lactic acid in the rheumatic series than in the controls There were also more high values for the excretion of lactic acid in the rheumatics than in the controls There was therefore a difference in the metabolism of lactic acid in the two groups, which might be explained by an increased production of acid in some cases of acute rheumatism

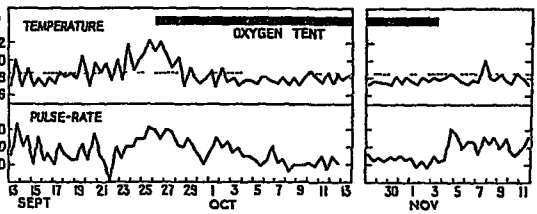

FIG 1—Fall of temperature and pulse rate in oxygen tent in a case of acute rheumatism with rise on coming out

A further investigation on the effect of oxygen on the metabolism of lactic acid is now being carried out in London, and Mr H J Taylor, Ph.D, working on behalf of the Empire Rheumatism Campaign, is kindly collaborating with me He has allowed me to quote the following typical case —

CASE 5.—A man, aged 39, was admitted to Lewisham Hospital on March 9, 1939, with acute rheumatism, pleurisy, and pericarditis The anti-streptolysin titre was 1250—ten times the normal There was a considerable fall in blood lactic acid while the patient was in the tent—i e, from 19·2 mg to 9·0 mg per 100 c cm.—and a considerable rise on the day after coming out—i e, to 23·1 mg.—when the pulse-rate and temperature were above normal, with a gradual fall later on

This suggests that the oxygen relieved the local anoxia of the heart muscle As might be predicted from the work in Birmingham, such striking changes do not take place in all cases of rheumatic myocarditis, nor are they present in the controls

OXYGEN THERAPY

The remainder of this report is based on a study of 26* rheumatic patients (15 in their first attack), treated with oxygen for periods varying from about a week up to eighty two days, at Guy's Hospital, Lewisham Hospital, Queen Mary's Hospital, Carshalton, and the Downs Hospital, Sutton The attempt was made to keep the oxygen percentage in the tent at 60–70, this could not be effected in a leaky tent The patient usually remained in the tent continuously, but after two or three weeks some patients were allowed out once a day for an hour to prevent boredom In wards where the technique was unfamiliar the patients came out twice a day for washing A control series of 33 cases of acute rheumatism (17 of them in their first attack) is available for comparison, these cases were mostly at Queen Mary's Hospital In 17 out of 19 cases treated with oxygen the anti streptolysins of the blood were abnormally high, emphasising the relationship of acute rheumatism to the hæmolytic streptococcus

Subjective clinical condition —In 17 of the 26 cases clinical improvement was noticed The patients felt better, they were more active and ate more, and cyanosis disappeared, one could "breathe better" The *improvement was most obvious in very ill patients*, such as one with pericarditis, nephritis and purpura, who was so ill that a note was made that oxygen had probably saved his life, another who had made but little recovery from a pericarditis; and another with pneumonia and pericarditis All these were children Improvement was noticed whether the acute rheumatism was a first attack or accompanied by an old-standing cardiac lesion Adult patients also felt better—e g, one with purpura and pleurisy besides an old mitral stenosis, one with pericarditis, pneumonia, and nephritis, and one with pleurisy and pericarditis

In 8 cases there was no clear subjective improvement 4 *patients did not feel unwell beforehand* Another patient, who developed tachycardia after tonsillectomy fifty three days previously, did not respond and only showed a temporary fall of pulse rate Another patient's appetite failed, though there was a favourable effect on the pulse and he was taken out after fifteen days Two patients had severe heart failure Barach and Richards (1931) noticed that oxygen did not cause much improvement in this type of case, though one of their patients collapsed after removal from the tent and had to be put back

This distinction was noted in a case in which an enlarged cardiac shadow indicated pericarditis On Aug 6, 1938, at Guy's Hospital, the patient did well in the tent, but the value of prolonged treatment was not realised and he was taken out after two days Two and a

* A further description of these cases in tabular form will be sent on application to the author

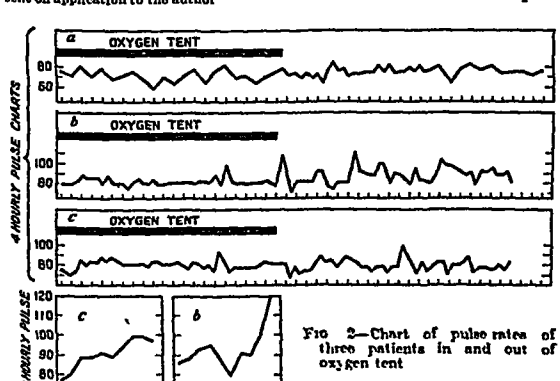

FIG 2—Chart of pulse rates of three patients in and out of oxygen tent

half months later, at Queen Mary's Hospital, he was put in the tent for thirty-five days; there was massive œdema, scanty urine, and an enlarged liver; he died soon after coming out. Hence oxygen should not be left till the last stages of rheumatic heart disease. In 2 cases without pericarditis radiograms showed that the width of the heart became smaller after treatment with oxygen.

Temperature and pulse-rate.—In 14 cases there was no fever at the time the tent was used, though in

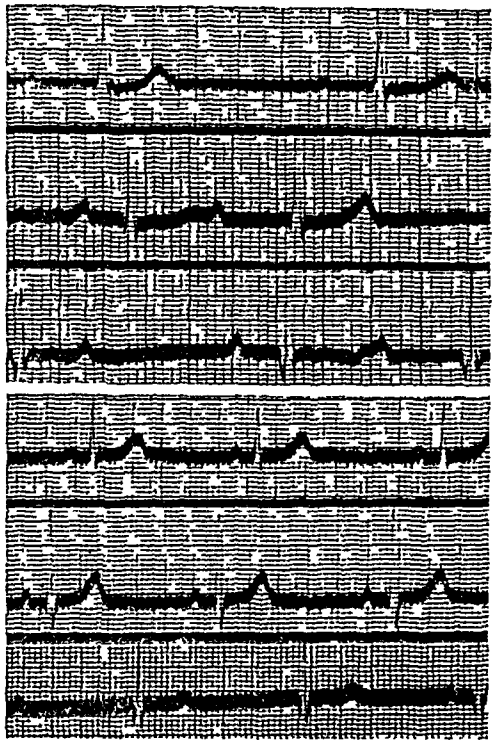

FIG. 3—Electrocardiograms in a case of acute rheumatism: (A) 29 XII 38, showing 2 to 1 heart-block and fall of S–T in lead 1 slightly below the iso-electric line, (B) 3 I 39, heart-block and S–T deviation have disappeared

most cases there had been recent fever. Fever was present in 12 patients, and all reacted with a fall of temperature in the tent, though in 2 the fall was slight. A striking example is illustrated in fig. 1. Salicylates and sulphanilamide, which might cause a fall of temperature, were not given in 8 of the 12 cases. In some the temperature rose again on removal of the tent, and it may rise again before the tent is removed. The temperature falls in pneumonia when a patient is at first treated in a tent, though it usually rises again later. This fall of temperature in two unrelated diseases suggests that tissue anoxia may be a factor in the formation of metabolic products responsible for fever.

A fall of pulse-rate was not brought about so readily as a fall of temperature (fig 1), but it was observed in 22 cases, though in some the fall was slight. In 18 cases the pulse-rate rose on removal of the tent. The rise in 2 mild cases is shown in fig. 2*b* and *c*; it began within an hour of leaving the tent. After this rise the pulse-rate may settle down again to a normal figure in the course of a week or so. In 1 case there was little or no rise of pulse-rate when the tent was removed (fig 2*a*). Presumably the treatment had been carried out long enough in this case.

Alteration of murmurs with oxygen treatment was noted in 15 cases—11 with a first attack and 4 of old standing: (1) there was a diminution of intensity or a disappearance of a systolic and/or mid-diastolic murmur in the tent in 10 cases, and reappearance with increased intensity outside the tent, (2) the first sound became louder in the tent; and (3) the quality of murmurs changed. For instance, a systolic squeak disappeared, though it became faintly audible on occasions later on, while the patient was still in the tent. There was also a temporary disappearance of a squeak in 1 case during the second treatment.

In 10 cases no change was noted. In 4 the murmurs were either very soft or absent; 5 were of old standing, and in 1 pericardial sounds overshadowed the murmurs.

Electrocardiograms.—More than one E.C.G. and sometimes serial E.C.G.s were taken in 18 cases. Only occasionally was the E.C.G. taken with the patient in the tent; this is not so important, for the effect of the oxygen probably lasts some time after the patient's removal from the tent; at any rate there is not much rise in pulse-rate for half an hour. E.C.G.s were taken, unrelated to oxygen treatment, in a control series of 27 rheumatic cases.

The rheumatic patients treated with oxygen and the controls showed improvement in the same proportion so far as low voltage was concerned, but this sign is rather uncertain, for it is readily produced by drying of the electrodes. There was frequently slight deviation of the S–T interval, which is taken to mean local want of oxygen (fig 3*a*). It was always much less than that commonly observed in coronary thrombosis or in old-standing myocardial disease. In all the 4 cases in which it was present it improved with oxygen, and in only 3 out of the 16 cases of the control series in which it was present. One case showed slurring of the S wave, which became normal after five days in oxygen. The change from upright to inverted T waves and vice versa took place in 12 per cent. of patients treated with oxygen and in 30 per cent. of control cases during the period of observation.

In 16 cases treated with oxygen the P–R intervals could be compared. A length up to 0·18 sec has been allowed as normal for a child and 0·20 sec for an adult. In 8 cases the interval was normal. In 6 it was long and became normal with treatment. One of these patients, just before going into the tent, had classical 2 to 1 heart-block with increasing P–R interval and pulsus bigeminus (fig. 3*a*). Five days later, in oxygen, a normal P–R interval was obtained (fig. 3*b*). The pulse was regular and normal in rate three days after going into the tent; hence the heart-block may have disappeared by then. In 2 cases the P–R interval was long and became normal, but on one occasion in each case lengthening was again observed. Both of these patients have so far done well clinically. A study of the P–R interval was possible in 17 control cases. It was normal in 7 cases. In 6 it was too long, and in only 2 of these did it become normal—a contrast to the cases treated with oxygen. In 4 cases it was variable, lengthening and shortening at different times. The conclusion is that oxygen produces improvement in the electrocardiogram.

Later improvement with oxygen treatment.—For this assessment it is better to avoid cases with permanent cardiac damage but to consider patients in their first attack, in which improvement or recovery is more

likely As the time since oxygen treatment is short —two to ten months (average four and a half)—the conclusions are provisional Only 7 of the 15 cases in their first attack are available, as in the others the time of observation since treatment has been shorter than two months The result is considered to be good if (1) only a soft systolic murmur was present before treatment and this has disappeared, or (2) a canter rhythm or diastolic or presystolic murmur or a third or fourth heart sound (McKee 1938) or a loud blowing or musical systolic murmur with a weak first sound has disappeared and the only auscultatory signs remaining are a soft systolic murmur with a good first sound and/or an accentuated and sometimes reduplicated pulmonary second sound, the reduplication being usually heard towards the end of inspiration, or (3) a pulse-rate previously rapid now remains normal not merely as charted but also when the physician examines the patient With these criteria the results in 6 of the 7 cases are good The seventh patient, who was only in the tent thirteen days, has a rapid pulse rate with a systolic murmur after two and a half months—a poor result These were all severe cases when first treated, and the time in the tent was too short in 2 cases One patient, who writes happily from Eire and wants to come back as wardmaid at Guy's Hospital, is not included in this series

A control series of 16 cases at Queen Mary's Hospital observed over the same period tells a different story In 2 patients with systolic murmurs the cardiac condition cleared up in less than a month in one and in eleven weeks in the other Another patient began with nodal rhythm, ventricular escape, and presystolic and systolic murmurs, after two months there were a systolic murmur and good first sound, and the pulmonary second sound reduplicated on inspiration These 3 results are good The remaining 13 are poor: in 2 soft systolics appeared and have persisted for nearly nine months in one and over two months in the other, and in 2 there were loud systolic murmurs and weak first sounds, in 5 there remained mid diastolic murmurs or their equivalents, in 2 there remained aortic diastolic murmurs, and in 2 there was tachycardia, with a late blowing systolic in one Most of the patients treated with oxygen were more acutely ill than the controls, this is also suggested by the anti-streptolysin titres, which were on the average 630 and 268 in the two series The numbers are small, and this section should only be looked on as an appendix to the rest of the paper, but the number of good results is so different in the two series that oxygen may have made a difference to the prognosis Further work along these lines is required

Conclusions

(1) The importance of local tissue anoxia and its treatment with oxygen has not hitherto been recognised, except that success has been claimed for oxygen therapy in varicose ulcer with local oedema, poisoning with alcohol, and coronary thrombosis

(2) The inhalation of a high percentage of oxygen may have a wide application in treatment, its use in cerebral hæmorrhage, thrombosis, and embolism is suggested

(3) The evidence that there is local anoxia in rheumatic myocarditis is (*a*) a changed lactic acid metabolism, and (*b*) clinical improvement on treating patients with oxygen, resulting in fall of temperature and pulse rate, alteration of murmurs, diminution in the size of the heart, and electrocardiographic changes Oxygen treatment in early cases appears to be of permanent benefit, but in this connexion further observations are required

I wish to thank Sir Frederick Menzies for allowing me to quote cases at L C C hospitals, Mr E M. Heckmans, Ph D, and Drs N Gray Hill, George Melton and E W Todd for their coöperation, and the Medical Research Council for an expenses grant

TESTS FOR ATHLETIC EFFICIENCY*

By Sir Adolphe Abrahams, O B E, M D Camb, F R C P,

PHYSICIAN TO OUTPATIENTS, WESTMINSTER HOSPITAL, LONDON HON MEDICAL OFFICER TO THE INTERNATIONAL ATHLETIC BOARD

The subject of physical fitness is very much in the air The Government has considered it desirable to institute an elaborate investigation Our profession will naturally be consulted, our opinion will frequently be requested, on very rare occasions it may even be paid for That is my excuse for bringing forward so elementary a communication

I have to restrict myself to a very limited aspect of the subject Physical fitness and athletic efficiency are not by any means the same thing Fitness I conceive to be *satisfactory* adjustment to one's environment, the term being used in the widest sense A man may be fit to climb the Matterhorn yet quite unfit to endure the strain of city life, fit to row from Putney to Mortlake yet quite unfit to undertake the duties of a resident in a fever hospital And clearly the reverse also holds good The assumption of "fitness" involves a number of factors, some of which cannot be assessed at all So I restrict myself to the subject of athletic efficiency, which is to some extent at any rate directly measureable

RESPONSE OF CIRCULATION TO EFFORT

For practical purposes the comparatively simple methods in common use to estimate the physical efficiency of the healthy athlete are probably as satisfactory as the more elaborate investigations which are, after all, only extensions of fundamental principles In general we depend on the response of the circulation to effort, as denoted by cardiac acceleration or by variation in blood

* A paper read before the Association of Physicians

CRAMPTON'S TABLE OF NUMERICAL STANDARDS OF FITNESS

Pulse-rate increase	Systolic blood-pressure (mm)										
	Increase						Decrease				
	10	8	6	4	2	0	2	4	6	8	10
0–4	100	95	90	85	80	75	70	65	60	55	50
5–8	95	90	85	80	75	70	65	60	55	50	45
9–12	90	85	80	75	70	65	60	55	50	45	40
13–16	85	80	75	70	65	60	55	50	45	40	35
17–20	80	75	70	65	60	55	50	45	40	35	30
21–24	75	70	65	60	55	50	45	40	35	30	25
25–28	70	65	60	55	50	45	40	35	30	25	20
29–32	65	60	55	50	45	40	35	30	25	20	15
33–36	60	55	50	45	40	35	30	25	20	15	10
37–40	55	50	45	40	35	30	25	20	15	10	5
41–44	50	45	40	35	30	25	20	15	10	5	0

pressure; and since the reaction of the vasomotor system is the essential criterion, it may be regarded as sufficient to ascertain the alterations which occur in changing from the horizontal to the vertical position, even if effort is entirely eliminated by strapping the subject to a tilting table. In a fit subject the vasomotor system quickly adjusts itself, and the increased vasomotor tone is demonstrated by a small rise in blood-pressure; in the unfit the veins fill first and the cardiac rate accelerates by way of compensation for the sudden fall in arterial pressure—doubtless a carotid-sinus reflex.

C. Ward Crampton has constructed a table which gives a numerical standard of fitness based on this change of posture (see the accompanying table). A perfectly efficient circulation would be denoted by the 100 mark; at 0, unconsciousness would result on the assumption of the erect attitude.

On the whole, I believe any method into which blood-pressure estimations enter to be fallacious. The influence of emotion is often considerable in the highly sensitive nervous type not infrequently encountered among track athletes

40 MILLIMETRE TEST

The "40 millimetre test" is particularly favoured by the Royal Air Force Medical Service. In this test the subject sits with his nasal respiration occluded with a clamp, and, by expiring through a suitable mouth-piece, sustains a column of mercury at the height of 40 mm so long as he is able Meanwhile the observer takes the pulse-rate during each succeeding period of five seconds In a satisfactory test the pulse-rate remains almost unaltered for a minute or longer; in bad results the duration is brief and the pulse-rate fluctuates *It is not exactly clear what is actually tested.* One explanation is that tone of the abdominal walls is the important factor, another supposes that positive pressure on the thoracic contents impedes diastolic filling, and that the state of the ventricular wall is thus tested. Yet I doubt if the ventricular musculature has anything to do with it—I am considering, of course, the athlete in whom pathological changes are presumably absent. Probably anoxia resulting from deficient circulation is the essential factor; and, as we know, people differ enormously *in their reaction to anoxia*

In my experience with athletes this test is of little if any value: the fittest men sometimes exhibit extremely bad results, and good results are often encountered in subjects who are not particularly athletic, however suitable they may be as aviators. I am reminded, however, by the Air Force authorities that the test is far from foolproof; it requires practice by the subject and some experience and skill on the part of the observer to produce a legitimate result. With a little practice and proper coöperation between subject and observer repetition of the test may lead to such a degree of improvement as to prove how much depends on technique in its performance

DECELERATION

The relation of the cardiac rate to exercise is so obvious a criterion, and its investigation is so simple, that it must naturally make the strongest appeal as a test of efficiency. *It must be remembered that, although* the heart looms largely as a superlative factor in exercise (in my opinion far too largely), it is only one of the elements concerned in a problem into which also enter the lungs, the blood, the skeletal muscles, the skin, and the nervous system (including the higher centres), besides a coördinating factor which is probably *within the province of the biochemist.* But, since the object is to estimate physical efficiency in the healthy subject, the isolation of any one factor is of no importance

Any method which provides a form of muscular exertion may be utilised as a system of graduated exercise to afford a measure of the work done and the stress imposed. *Among methods in common use* are the lifting of a weight through a measured distance a prescribed number of times, and the use of a pulley for the same purpose Again, the subject may run up and down a flight of stairs in an approximately fixed time, step on and off a chair of standard height at a given rate, raise and lower the arms, bend the trunk, or pedal a stationary bicycle. It is a pity that those of us who are interested in tests of efficiency have not agreed on a standard effort. At present each of us employs his own method, so that results are not comparable I am considering in this connexion only perfectly healthy subjects, and to estimate this condition of training I apply as violent an effort as I have been able to devise to occupy twenty seconds The degree of cardiac acceleration I do not consider to be of any great consequence; for, after all, cardiac output may be increased in one subject mainly by acceleration and in another by increasing the stroke volume. But the rate of deceleration I believe to be a valuable index of fitness. As a rule, deceleration begins within 10–15 sec of the cessation of exercise and continues regularly with

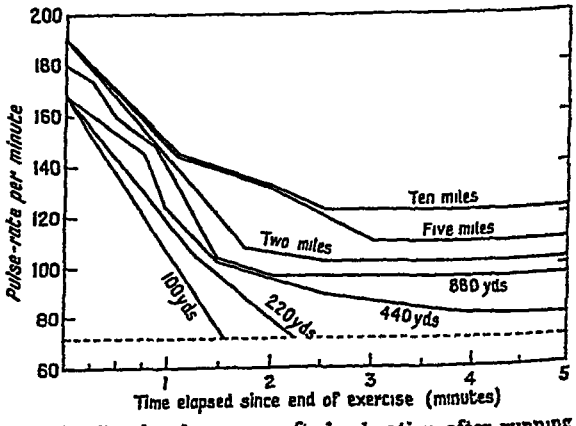

FIG 1—Graphs showing swift deceleration after running short distances.

a return to the resting rate within 45 sec But in a few outstanding examples, of whom the leading British runner of the present day is one, a different result has been noted the tachycardia persists for approximately ¼ min and suddenly yields to the resting rate It seems as if the circulatory system works on two gears, so to speak There must be some "clicking over" of a nervous regulatory mechanism, but I cannot find a satisfactory physiological explanation This simple test I have found to be an adequate guide to fitness during training, a bad result encourages a search for the cause, usually a toxin. Incidentally, I may say I am appalled at the carelessness of the average athlete in elementary hygiene (septic teeth and tonsils, neglect of the bowels, boils, and various skin eruptions)

A striking example was a recent champion quarter-miler Although occasionally brilliant his form was erratic, and I found corresponding variations in this exercise tolerance test The only physical disability identified was pruritus ani, for which he had undergone much treatment, including Ball's operation A surgical colleague discovered an intermittent discharge from a congenital fistula Apparently, occlusion from time to time led to absorption of septic and toxic

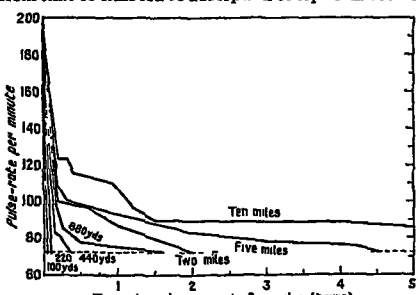

FIG 2—Deceleration after running distances from 100 yards to 10 miles

material, and a free discharge to discomfort but to relative athletic fitness After appropriate surgical treatment the exercise-tolerance test at once became satisfactory and constant, and correspondingly his efficiency was practically demonstrated by a record performance

RUNNING TEST

Now, although the various efforts mentioned are satisfactory for a short experiment, their psychical value is exceedingly low: in their continued performance boredom rapidly ensues, and they are not applicable beyond a comparatively short duration To extend this physiological investigation to any desired extent I selected the exercise of running Granted a constant velocity, it remained only to run over a series of measured distances to obtain a mathematical representation of the exercise taken An experienced runner can develop an automaticity which within his natural limits is almost perfect I have seen a good middle distance runner undertake to complete three miles in 15 min and exactly achieve this performance with a variation of not more than ½ sec. in each quarter mile

In my own case many tests under differing conditions led to the conclusion that—at the time during which the observations were made, not, alas, at the present day—my automaticity provided no greater error than 0·8 per cent over a maximal distance of ten

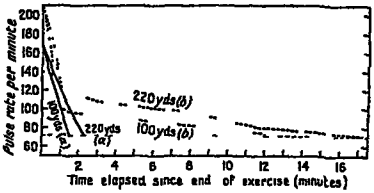

FIG 3—Comparison between fixed automatic rate (*a*) and extreme effort (*b*) of running

miles at a rate of 6 min 23 sec for each mile (0·8 miles in the hour) With this speed as the fixed rate, such orthodox distances were run as 100 yards, 220 yards, quarter, half, and one mile, two, five and ten miles, and observations of the pulse rate were taken

Two assistants were employed, one to count the pulse and report at the end of every 5 sec to his colleague, who noted the figures The fall in rate is so rapid (fig 1) during the first 2 min that such brief intervals must not be exceeded, afterwards it suffices to count for 15 sec every ½ min, then every alternate ½ min and later for 1 min every 5 min, until during the protracted observations following the long runs the pulse rate is noted at half hourly intervals

Fig 1 shows that, whatever the duration of the exertion, the rate of immediate deceleration is always very rapid After the shortest effort—100 yards—the resting rate has already been reached after only 1½ min rest, and even in the case of the ten miles run a substantial reduction can by this time be noted As the duration of the exercise increases, the return to the resting rate becomes correspondingly prolonged Thus, in regard to the ten miles run, although the pulse rate has fallen to 0·5 at the end of 1½ hours (fig 2), it is not until another 7½ hours has elapsed that the normal is reached.

As a supplementary experiment these results may be compared with those obtained after extreme exertion The application of this experiment is necessarily limited, for no man can be expected to put forth the extreme effort of which he is capable over more than a certain range, depending partly on his natural ability and partly on his athletic experience In my case, half a mile was the limit, but, since for scientific observation it was impossible to repeat such experiments upon many occasions, results are appended corresponding only to the distances of 100 and 220 yards.

In fig 3 a comparison between the fixed automatic rate (*a*) and the extreme effort (*b*) is shown, and from these it becomes evident that deceleration of cardiac rate is no absolute guide, inasmuch as the severity of running a furlong at full speed, as judged subjectively by the sense of exhaustion and distress, is greater than that experienced after a run of several miles at the slow automatic rate Delayed deceleration, then, is related to duration of exercise which in some way must lead to a block upon vagus inhibition, unless it is of purely cardiac origin—exhaustion of its glycogen supply, for example, with subsequent functional disability

THE SUPER ATHLETE

Finally, a word on the super athlete It is natural to desire to identify some factor which makes for supremacy, it is only to be expected, however,

that any such search will be disappointing. After all, although the objective superiority on the track of the super-man (the Olympic champion) over the generally accepted "first-class" athlete is very striking, numerically considered it amounts to only perhaps 4 per cent. Such a difference, if depending on anatomical conformation making for better leverage, would be outside the range of accurate measurement, furthermore, the difference might be some tiny superiority in muscle chemistry or other biochemical factor. When all is said and done, it is a question of coordination of all the various factors working in harmony. Even so mechanical a structure as a motor engine presents the same problem: the perfect chassis is produced when all the parts concerned in locomotion are exactly right at the right moment. And when, as in the case of the human machine, vital phenomena are added, it is not remarkable that no one outstanding criterion can be identified.

SUMMARY

(1) Athletic efficiency is usually tested by the response of the circulation to effort or to other factors influencing cardiac acceleration or blood-pressure.

(2) Every test involving blood-pressure is fallacious, because of the emotional factor.

(3) The rate of cardiac *deceleration* after a short intense effort is a valuable index of athletic fitness.

(4) For investigation of the effect of prolonged effort, the ordinary tests are impracticable. Running various distances is suggested as a more satisfactory method, and examples of its application are given.

BIOLOGICAL EFFECTS OF THE SYNTHETIC ŒSTROGEN HEXŒSTROL

4 : 4'-DIHYDROXY-γ : δ-DIPHENYL-*n*-HEXANE

BY N. R CAMPBELL, B.Sc Lond.
HALLEY-STEWART FELLOW

E. C. DODDS, M V.O., D.Sc., M D Lond., F.R C P.
COURTAULD PROFESSOR OF BIOCHEMISTRY IN THE UNIVERSITY OF LONDON

W LAWSON, M Sc Lpool
SENIOR ASSISTANT, COURTAULD INSTITUTE, AND

R L. NOBLE, M.D. Toronto, Ph.D. Lond.
LEVERHULME FELLOW OF THE ROYAL COLLEGE OF PHYSICIANS OF LONDON

(From the Courtauld Institute of Biochemistry, Middlesex Hospital, London)

THE œstrogenic activity of the synthetic substance 4 : 4'-dihydroxy-γ : δ-diphenyl-*n*-hexane (hexœstrol) has been described by Campbell, Dodds, and Lawson (1938) They found that doses of 0 15 μg administered to ovariectomised rats gave an œstrus response in 60 per cent. of animals, whereas a dose of 0 1 μg. gave a 20 per cent. response It appeared that this substance, therefore, was more active than either diethylstilbœstrol (Dodds, Lawson, and Noble 1938) or 4 : 4'-dihydroxy-γ : δ-diphenyl-β : δ-hexadiene (Dodds, Golberg, Lawson, and Robinson 1938) in producing vaginal œstrus In the present paper the œstrogenic activity of hexœstrol has been compared with these other substances and its general biological effects have been studied

BIOLOGICAL ACTION

Rabbit uterus —The action of hexœstrol on the uterus was determined in ovariectomised rabbits. It was found that 100 μg of this substance given over seven days sensitised the uterus so that subsequent injections of progesterone were followed by typical uterine proliferation. Hexœstrol in large doses (10 mg.) caused uterine hypertrophy without proliferation of the mucosa

Mammary growth.—Male guineapigs about 200 g. in weight were injected subcutaneously every other day for twenty days. The total dose of hexœstrol was 200 μg. Growth of the nipples and development of the mammary tissue were observed.

Anti-implantation —It was previously shown that stilbœstrol would effectively prevent implantation of the embryo in rats (Parkes, Dodds, and Noble 1938) The hexœstrol was tested, therefore, in a similar manner. Female rats were allowed to mate, as shown by the vaginal plug, and on the following three days received various doses of hexœstrol in oil by mouth The total dose and the effect on implantation are shown in table I. A total dose of

TABLE I—EFFECT OF HEXŒSTROL ON IMPLANTATION

No of rats	Total dose of (hexœstrol μg)	Pregnancies
10	0	9
5	1	5
5	10	2
5	25	1

25 μg. of hexœstrol prevented pregnancy in 4 out of 5 animals, and 10 μg. was effective in 3 out of 5 rats This substance, therefore, appears to be as equally effective by mouth in preventing implantation in the rat as was stilbœstrol.

Other effects —In preliminary experiments hexœstrol was found to produce effects similar to those produced by stilbœstrol (Noble 1938) when administered to rats for twenty-eight days These were characterised by a reduction of body growth in adult rats and by a severe atrophy of the gonads with a secondary atrophy of the accessory organs in the male.

ŒSTROGENIC ACTIVITY

Immature rat uterus —Immature female rats weighing 40–45 g. received subcutaneous injections twice daily for three days and were killed on the fifth day. The synthetic œstrogens were made up in alcoholic solution and diluted with water to the required concentration. At autopsy the uteri were dissected and fixed in Bouin's solution and later weighed after removal from a 70 per cent solution of alcohol The results obtained with stilbœstrol and hexœstrol are shown in table II Although the

TABLE II—COMPARISON OF ŒSTROGENIC ACTIVITY OF HEXŒSTROL AND STILBŒSTROL ON IMMATURE RAT UTERUS

Substance	No of rats	Total dose (μg)	Vagina	Average weight of uterus (mg)
Nil	5	0	Closed	26 2
Stilbœstrol	5	0 05	Closed	41 3
	5	0 1	"	68 8
	5	0 5	4 open	147 6
Hexœstrol	5	0 05	Closed	71 0
	5	0 1	"	77 0
	5	0 5	3 open	129 4

number of rats used was small, it is apparent that there was no great difference in the activities of the two synthetic œstrogens

Vaginal œstrus —Ovariectomised adult rats were used for assay purposes. The subcutaneous injections

were given twice daily for three days, and aqueous solutions were used throughout A positive œstrus vaginal smear was considered to be one composed exclusively of keratinised cells The animals received an active substance every two weeks One batch of 60 rats were used to compare the activity of stilbœstrol with œstrone and the hexadiene substance (4 4' dihydroxy-γ δ diphenyl β δ hexadiene) In

TABLE III—EFFECTS OF SUBCUTANEOUS INJECTIONS OF ŒSTROGENS ON VAGINAL ŒSTRUS

Substance	Total dose (μg)	Œstrus (per cent)	I U per g
Œstrone	0 6	26	10 × 10⁶
	0 7	59	
	0 8	80	
Hexadiene	0 3	30	20 × 10⁶
	0 4	94	
Stilbœstrol	0 3	27	23 × 10⁶
	0 25	47	
	0 3	56	
	0 35	90	
Hexœstrol	0·2	33	28 × 10⁶
	0 25	55	

another batch of 30 animals the activity of stilbœstrol and hexœstrol was determined The results and the calculated number of international units per g are listed in table III, which shows that hexœstrol is the most active substance, being 2 8 times more active than œstrone when assayed under the described conditions All three synthetic substances, however, are two to three times more potent than the naturally occurring œstrone

TABLE IV—EFFECTS OF ŒSTROGENS GIVEN BY MOUTH ON VAGINAL ŒSTRUS

Substance	No of rats	Total dose (μg)	Œstrus (per cent)
Hexadiene	5	1 0	20
	5	3 0	100
Hexœstrol	5	2 0	20
	5	3 0	100
Stilbœstrol	5	1·0	20
	5	3 0	100

The three synthetic œstrogens also have been administered by mouth to small groups of unstandardised ovariectomised rats The substances were dissolved in sesame oil and 1 c cm was given by stomach catheter once daily for three days The results are shown in table IV All three substances showed a high degree of activity after oral administration Œstrone tested under similar conditions was relatively inactive by mouth for a dose of 50 μg gave an œstrus response in 1 out of 5 rats and 75 μg a response in 2 out of 5 animals

Some preliminary experiments were conducted on the intravaginal application of synthetic œstrogens in ovariectomised rats These were given in two doses each of 0 01 c cm oil by a micro syringe, one in the evening and one on the following morning It was found that a total dose of stilbœstrol 0 004 μg per rat gave an œstrus smear in each of 5 rats A similar dose of hexadiene produced a positive smear in 5 out of 10 rats, and when hexœstrol was used 6 out of 10 rats showed an œstrus smear

SUMMARY

The synthetic œstrogenic substance 4 4'-dihydroxy-γ δ diphenyl-n-hexane has been found to sensitise the uterus of the ovariectomised rabbit to the action of progesterone and to stimulate the nipples and mammary glands Implantation in the rat was prevented by oral administration of the œstrogen Reduction of body growth and atrophy of the gonads followed its prolonged use in rats

The uterus of the immature rat was increased in weight by stilbœstrol and by hexœstrol, the changes produced indicating that the activities of the two substances were approximately equal

When assayed by injection into ovariectomised rats, hexœstrol was found to be more active than stilbœstrol, and both were two to three times more active than œstrone Stilbœstrol and hexœstrol showed approximately the same degree of activity when given by mouth and when applied intravaginally

Clinical and Laboratory Notes

BILATERAL TUBERCULOUS EFFUSION

IN MILIARY TUBERCULOSIS OF LUNGS

BY GEORGE HURRELL, M D Durh, D P H
TUBERCULOSIS MEDICAL OFFICER, NEWCASTLE-ON-TYNE AND
E F DAWSON WALKER, M D Durh, D P H
MEDICAL SUPERINTENDENT OF THE CITY HOSPITAL FOR INFECTIOUS DISEASES, NEWCASTLE-ON-TYNE

THE following case appears to be worthy of record in that a search of recent medical publications has not brought to light one of a similar nature

The patient, aged 26, a carpenter, died from an acute bilateral tuberculous effusion with a very recent miliary spread in the lungs secondary to the pleurisy He was seen by one of us (G H) in his home at the request of his doctor on Jan 17, 1939 There was no family history of tuberculosis, and the patient's health had been good until September, 1938, when he had an attack of influenza Since that time he had never really been well and had been definitely worse during December, 1938, and January, 1939, and from the beginning of the latter month he had been confined to bed When seen his chief complaints were of cough and dyspnœa He looked hectic and had been running an evening temperature about 101° F for the last three weeks Physical examination showed an extensive effusion in the right chest

On admission to the City Hospital for Infectious Diseases Newcastle on Tyne, on Jan 18, his general condition was good, apart from his hectic appearance Temperature 99 4° F pulse rate 120, and respiration rate 34 The right chest was dull throughout, with faint breath sounds and diminished vocal fremitus and resonance his heart being displaced 1 in to the left A radiogram of his chest showed, in the right hemithorax, a massive effusion, which on exploration proved to consist of clear straw coloured fluid

Two days after admission he became worse and was delirious for a short time His temperature began to swing, ranging from 98 4° F. in the mornings to 102° F. in the evenings. On the 26th the breath sounds in the left lung were found to have altered and become jerky. A radiogram of his chest showed that the effusion in the right side was clearing and a new effusion developing at the left base. On the 28th friction sounds were audible over the pericardial area, and on Feb. 1 a coarse pleural rub had developed anteriorly in the left chest. The condition of the right chest improved, the dullness decreasing in its upper half and the breath sounds becoming faintly audible over the same area.

For the next week the temperature continued to swing and became remittent, reaching 104° F. in the evenings, while the general condition slowly deteriorated. The patient, however, insisted that he was doing well and would soon be up and out of bed. On the 10th the right chest, on physical examination and on radiography, showed further clearing, the effusion being limited to the lower third; but the effusion in the left chest continued to increase The next day a blood-culture was taken which was negative. Pleuropericardial friction sounds were audible at that time and the respiration-rate increased to 44 The last radiogram, taken on the 15th, showed bilateral effusions, that on the left side being the larger. On the 17th both sides of the chest were explored, and clear straw-coloured fluid was obtained from each. The patient died on the 21st.

The fluid obtained from the right chest on Feb 7 contained lymphocytes but no tubercle bacilli. The fluids obtained from the right and left sides of the chest on Feb. 17 contained lymphocytes and tubercle bacilli. Sputum examinations throughout were negative for tubercle bacilli Scanty pneumococci were obtained from the sputum by mouse inoculation but did not react to any of the type sera.

On post-mortem examination the following naked-eye appearances were seen. When the sternum was raised the pericardium was seen to be thickened and surrounded by an organised exudate. The right pleural space was obliterated by thickened gelatinous exudate. The left pleural space contained an effusion with some gelatinous strands in it, and the left lung was partially collapsed.

On section no naked-eye evidence of tuberculosis was seen in either lung. The interlobar septum on the right side was thickened and contained one caseous nodule A smear made from this contained tubercle bacilli. There were some enlarged mediastinal glands, and a few scattered tubercles were seen in the spleen and liver.

Portions of these tissues were sent to the University of Durham pathological laboratory for examination, and the following is the report received from Prof. A. F. Bernard Shaw.—

(*a*) *Right lung.*—This consists of a piece of lung 3 0 by 2 0 cm., the pleura of which is thickened (0 4 cm.) by a white organising exudate. Microscopically this shows an organising tuberculous pleurisy. The underlying lung shows partial collapse, œdema, and some miliary foci of tuberculosis.

(*b*) *Left lung.*—This piece shows a similar appearance to (*a*), but the pleura is not so thickened. Microscopically there is organising tuberculous pleurisy with collapse and œdema of the lung, in which are recent miliary tubercles.

(*c*) *Splenic lymph-node.*—This is enlarged (1 0 cm.) and shows microscopically actively necrotising tubercles of allergic type.

In this material the pleuræ show the oldest lesions, while elsewhere the lesions are secondary and recent.

SUMMARY

A case is recorded in which a patient suffering from pleurisy with effusion on the right side developed a similar condition on the opposite side Both effusions were clearly shown on radiography. During the illness the original effusion was clearing up. The illness lasted eleven weeks. A terminal generalised miliary tuberculosis was discovered post mortem.

We are indebted to Dr. J. A. Charles, medical officer of health, Newcastle-on-Tyne, for permission to publish this case; and to Professor Bernard Shaw for permission to use his report.

INTUSSUSCEPTION DUE TO SARCOMA

BY A. GRAHAM APLEY, M.B. Lond.

SENIOR HOUSE SURGEON AT THE ROYAL VICTORIA HOSPITAL, FOLKESTONE

ATTENTION has been drawn in recent surgical reports to sarcoma of the intestine in children. The case recorded below presents certain curious features differing from the now well-recognised clinical and pathological description.

A sarcomatous mass growing from the gut wall into the lumen of the intestine is an obvious predisposing cause to intussusception; yet Speese (1914), who collected 74 cases of intestinal sarcoma, found it in only 14 Simpson-Smith's (1938) examination of the published reports of this condition in children revealed a 24 per cent. probability of intussusception, though only in about a third of these cases was the intussusception an early feature, it usually following the recognition of a palpable tumour by weeks or months.

The following are some of the well-established facts pertaining to the condition. Intussusception occurs in some 30 per cent. of small-gut tumours (Joyce 1934) but most of these are benign (Raiford 1934), being lipomata, adenomata, and the like The ileum is the commonest site for a sarcoma (68 per cent.), and only 8 per cent develop in the jejunum. There is a high incidence of secondary deposits, though a few cases have been recorded in which none was found. Clinically, the commonest features in order of frequency are a palpable abdominal mass, a decline in the general health of the patient, and persistent vomiting Several patients with recurrent intussusception due to a tumour underwent a number of operations before the true cause was discovered (Oughterson and Cheever 1929)

CASE-RECORD

The patient, a somewhat undernourished boy, aged 9, was admitted after having had colicky abdominal pain for five days. This had come in attacks lasting about ten minutes at a time, and, though nausea had been absent most of the time, there was vomiting on one occasion.

In bed he was rather fretful and looked ill, with a furred tongue, temperature 99° F. and a pulse-rate of 110. The abdomen was slightly tender all over, but especially so over McBurney's point, and the right lower rectus presented some guarding. There was no suspicion of distension, nor was there any palpable mass. Rectally he was a little tender on both sides and there was no blood on the examining finger.

A diagnosis of appendicitis was made, but at operation the appendix was found to be only slightly inflamed No other abnormality was seen or felt in the abdomen. His condition subsequently deteriorated, the pulse-rate and temperature rising, and some twelve hours later he voided copious greenish-brown vomit. On several occasions after this he vomited

in an effortless fashion, though he never complained of pain or became distended Despite continuous intravenous infusion because of his dehydration, his condition continued to deteriorate and he died twenty-six hours after operation

At necropsy two large dark-red polypi were found in his gut Each was about 1½ in in diameter and situated in the jejunum some 6 in and 12 in from the duodenojejunal flexure respectively The proximal of these formed the apex of an intussusception which, because of well-formed adhesions, was evidently old-standing Both tumours appeared to be about the same age, and the intervening gut looked normal No secondary deposits were found Microscopic section showed each of the growths to be a small round-cell lymphosarcoma

DISCUSSION

This case had several unusual features —

(1) It presented as an acute abdomen, though there were no clinical features to suggest an intus susception

(2) The intussusception was so situated that its recognition at operation was highly improbable

(3) It appears to be distinctly uncommon to find two such growths with no secondaries elsewhere, though the possibility must be borne in mind that the distal growth arose by implantation of cells from the proximal

I wish to thank Mr J W D Buttery for permission to publish this case and Dr I B Morris for assistance regarding its pathology

MEDICAL SOCIETIES

BRITISH MEDICAL ASSOCIATION

SCIENTIFIC MEETINGS, JULY 26–28

SECTION OF PUBLIC HEALTH AND HYGIENE

Dr JAMES MACKINTOSH, chief medical officer to the Department of Health for Scotland, presided over a discussion on

Medicine and the State

Public health, he said, was more and more coming to be regarded as *social medicine* and Scotsmen had played a pioneer part in the development of this newer outlook The names of J D Russell and Ballantyne, and more recently Parlane Kinloch and Sir John Orr, came readily to mind

Dr ANDREW TOPPING (London) proclaimed himself at the outset an advocate of the salaried medical service A review of the present situation, both in medical education and practice, revealed much that was unsatisfactory He thought that a salaried service would appeal to the majority of practitioners The medical curriculum was criticised as devoting much time to non essentials, such as the watching of difficult and specialist operations, whereas far too little time was devoted to infant feeding, midwifery and other important parts of general practice The position of the general practitioner was highly unsatisfactory He had no hospital appointment was not free for postgraduate study, and had little time for *medical reading, general practice* was becoming instead of a high souled profession a rather unethical trade The wrong type of doctor was often more successful than his painstaking and conscientious neighbour Consultants and specialists too were in a false position financial assets were often more important than medical capabilities, success was problematical and not measured by ability Public-health and social services suffered likewise from many disadvantages Many local authorities were unable to provide the services they should, so that the scope of those working with them was limited The time had come to consider how best improvement could be obtained The medical profession was a thinking serious part of the human race, anxious for the welfare of the people It was most desirable, if not indeed essential, that doctors should have a feeling of security and be able to devote themselves unstintingly to their work There would obviously be difficulties in achieving an ideal service but it was absurd to regard them as insuperable The history of the many services already introduced showed what could be done He would like to see a careful selection of students in the first place, a modernised curriculum and a reduction of the expenses of medical education Every graduate should have a period in hospital and all should have salaries commensurate with age and knowledge The hospital should be the centre of the medical region, the organisation radiating out from it He did not believe that work would become slack under a salaried system, but rather the reverse Control of the service must be entirely non political *and should in his view be in the hands of medical men*

Dr W G BOOTH (Boston, Lincs) said that a new outlook on medicine had sprung from the great increase of scientific knowledge in the last century and from the education of the masses He believed that the growing awareness on the part of the working people of the growth of medical knowledge made them dissatisfied with the limitations of national health insurance An effort had been made to provide for the deficiencies by public-health measures, such as mother and child welfare acts Development had been on the public health side rather than in the practitioner service The difficulties associated with this development tended to stimulate the possessive and acquisitive instincts of the practitioners Under a controlled medical service the attitude would be different as the patient would be in relation to the state He reminded the meeting of Bernard Shaw's dictum that there is no greater danger to the public than a poor doctor Some form of state medical service was inevitable He considered that encroachment on the work of practitioners would have been even greater had not the medical officers of health restrained local authorities, and it was not likely to become less The general practitioner if he were wise would press for a state service as quickly as possible before encroachment wiped him out altogether While the British Medical Association was strong it should push forward with suggestions

Dr H J RAE (Aberdeen) spoke of the public health services in the north east of Scotland from the end of the late war to the present time He pointed out how the various amalgamations in the form of regional services had overcome the shortcomings inevitable in having too small areas of administration The ideal unit in relation to the provisions of the Local Government Act was one with a population of a quarter to half a million The Aberdeen region with its population of some 340 000 fell within these

limits. In the county there were divisional officers at the periphery, in the city there were medical specialists in bacteriology, fevers, tuberculosis, and venereal diseases. The services of these officers were whole-time and available throughout the areas. In much of the work general practitioners were closely associated, more in the country than in the city. In the counties a liaison committee consisting of representatives of the county division of the B.M.A. and public-health officers met periodically to discuss matters of interest.

Dr. E. R. C. WALKER (Aberdeen) said that efforts must be made to agree on basic principles. The Scottish committee of the B.M.A. some five years ago had arrived at the basic propositions that medicine is essentially the application of human biology and that the health of an individual at any time is the measure of his success in reacting to his environment. If the development of the state was considered also from the standpoint of evolutionary biology, it could be regarded as an instrument devised by man favourably to alter his environment. Since medicine was by definition the art and science of restoring and maintaining health, it followed that the function of medicine was inevitably a concern of the state. From these propositions it followed also that the basic provision must be a corps of men and women skilled as health advisers. The wisdom of preserving freedom of choice as far as possible seemed to follow on this conception. Looked at in this way medicine was essentially a service and not a business and as such would seem more fittingly remunerated by salary than by fee. The emoluments and conditions of the service should be such as to attract young men and women of high qualifications. Rise in the scale of salary should take place early; this would encourage early marriage and the raising of healthy families so that the doctor's precepts could be reinforced by example. The service should be a national one and on balance a regional organisation with corresponding ad-hoc administration seemed indicated.

Dr. WALTER ASTEN (Bournemouth) said that the idea of a state medical service had the unfortunate effect of retarding the improvements for which all were looking. The word "state" was a bogy, especially in the profession. What was wanted could never be obtained under the existing system. In spite of the provision of the Local Government Act only about half the public-health committees had succeeded in implementing the intention of the act to absorb and improve the poor-law medical services.

Dr. SAGGAR (Dundee) said that public-health machinery was needed to dispose of the causes of disease. The doctor was not only a medical but also a social and political unit. He did not believe that free choice of doctor was very important and pointed out that the absence of free choice in education was not seriously resented. A state medical service would be much less costly than the present arrangements and the work of the doctor under it would be better and less arduous.

Dr. LAURENCE KILROE (Rochdale) said that the general practitioner was painfully aware of his shortcomings; they were made clear to him from all sides. He was impressed with the possibilities of a salaried service and thought that on the whole competition did more harm than good. He agreed with Dr. Walker that in the present state of world affairs there was plenty of time to work out a good scheme. He emphasised the necessity for coöperation between the B.M.A. and other bodies in such work.

Dr. WICKREMESINGHE (Ceylon) commented on the unanimity of opinion so far at the meeting. In Ceylon they had a salaried service and he thought there were many disadvantages in a state service. A servant of the state had to go where he was sent and when he was sent. He favoured reducing the difficulties of private practice by throwing open medical centres for use by practitioners, thereby improving their service to the community.

Dr. TOPPING in his reply urged that more consideration should be given to the subject generally. Financial and other detailed arrangements should be worked at. He believed that a state service would be self-supporting in a few years by reason of the effect it would have in eliminating overlapping and in the improvement of health. He criticised the B.M.A. as seeming often to put the interests of the members before those of the community.

Dr. MACKINTOSH, summing up, said that constructive criticism was needed. He pointed out that the distinction between a salaried and a state service was not a fine one but a broad and deep one. There was a great difference between a state service as exemplified by a civil service and a salaried service such as the education service. In the latter there was freedom of the individual members to form associations for the promotion and protection of their interests and freedom from direct governmental control.

SECTION OF SURGERY

With Prof. J. R. LEARMONTH (Aberdeen) in the chair, this section discussed

Venous Varicosities

Prof. LAMBERT ROGERS (Cardiff) said there were three factors in the production of varicose veins. First there was a congenital element, for example, in varices of pial veins over the cortex. Secondly there was a congestive factor as in pregnancy. Lastly posture was a very definite cause. Varicocele was a transient condition of adolescence and did not require any operative treatment. Before any treatment was begun the patency of the deep veins must be ascertained. Ligation combined with injection was the method of choice in most cases. Pregnancy was an indication for conservative treatment. Recurrences after injection alone were high. It was important to perform any ligation high up on the saphenous vein above the entry of any tributaries. Small varices, especially in pregnancy, might be treated by injection alone, and large venous pouchings were better excised. As a sclerosing agent he used that described by Biegelseisen in 1937, monoethanolamine oleate (Ethamolin) in benzyl alcohol. There was less danger of perivenous irritation than with other substances. He concluded with a plea for more surgery in the treatment of varicose veins.

Mr. W. B. GABRIEL (London) said that, in the treatment of hæmorrhoids, it was important to decide whether they were external or internal, whether there were any other ano-rectal conditions present and the degree of prolapse. External hæmorrhoids were covered by skin. Examination of the anal canal might reveal a prolapsed hæmorrhoid or surface ulceration above the obvious lesion. Acute anal hæmatoma was treated by excision of the hæmatoma along with a pear-shaped piece of skin and any skin tag present. An internal pile was covered by rectal mucosa which might become epithelialised. There was always a groove between the anal skin and the

pile mass There were three stages of internal piles according to the degree of prolapse, and it was important to ask the patient to strain down as the speculum was being withdrawn to see the degree of prolapse Other ano rectal conditions must be excluded by complete proctoscopy and sigmoidoscopy Treatment was expectant, by injection or operative Overindulgence in aperients was a common cause of hæmorrhoids In inflammatory conditions expectant treatment, rest and eusol compresses gave good results Portal pyæmia was a very rare complication Injection was ideal in first-degree piles which did not extrude even on defæcation, but was of less value in more advanced forms It was important to make the injection with 5 per cent phenol in almond oil at the upper pole of the pile The patient ought not to feel pain during the injection Operative excision was recommended in the third degree of prolapse Low spinal or local anæsthesia was better than inhalation anæsthesia, as the relaxation of the sphincter was more complete The operation he preferred was that described by Milligan and Morgan The pile was pulled down and the muco cutaneous junction cut with scissors The subcutaneous sphincter was exposed, and also the longitudinal muscle The pile mass was ligated using No 3 chromic catgut after transfixion The pile was then excised No attempt was made to approximate the skin closely Recurrences were mostly due to incomplete excision or faulty technique

Mr E T C MILLIGAN (London) gave statistics of a large series of cases treated at St Mark's Hospital Injection was of most value in first degree hæmorrhoids It was less use in the other degrees, but patients preferred it as it did not interfere with their normal life He discussed local factors in the production of hæmorrhoids The longitudinal muscle of the bowel was the main factor in maintaining the pile in its normal position When it became stretched an irreversible change had taken place Secondary fixing structures were the elasticity of the anal mucosa and submucosa and the blood vessels themselves Sclerosing injections replaced the secondary structures only At operation all the abnormal structures were removed, so that recurrence was almost impossible Successful treatment gave amazing comfort and relief to the patient

Mr PHILIP TURNER (London) described the operation of excision of varicose veins as tedious, futile, and bloody The weak spot was the saphenous opening where stasis was encouraged by the three superficial tributaries entering in a downward direction and by the occasional pressure of an enlarged lymph gland At operation it was advisable to ligate all the tributaries and to remove the lymph-gland

Mr J B OLDHAM (Liverpool) suggested that it was useful, when combining injection with ligation, to pass a ureteric catheter down the vein and inject through it while it was being withdrawn The operation for varicocele was useless and ought not to be made obligatory before entering the Services

Mr N L WATERFIELD (London) advised stretching of the anal sphincter at operation to relieve post-operative pain

Mr H J MCCURRICH (London) spoke of the empty vein technique of injection With it good results were obtained without the formation of a hard tender cord immediately after injection

Mr G GORDON-TAYLOR (London) had found Trendelenburg's operation a very good one provided the saphenous vein was tied flush with the femoral vein He also agreed that operation for varicocele was unnecessary

Mr J H F JAYASURIYA (Ceylon) said that varicocele due to filariasis was common in Ceylon Veins were grossly dilated and lymphatics blocked Secondary streptococcal infection was common but yielded to sulphanilamide Operation was the best treatment for this condition

Prof LAMBERT ROGERS, in reply to a question, said that he used monoethanolamine oleate in doses of about 5 c cm He had not used the empty-vein technique, but thought that it seemed to be a good one

Mr W B GABRIEL thought that stretching of the anal sphincter depended on the anæsthetic used If it were tight after proper spinal or local anæsthesia it must have some fibrous contraction and must be stretched or divided in the middle line posteriorly. His operation was not followed by stricture It was important to examine the anal canal digitally on the seventh day, and again after a few weeks

Radiotherapy and Surgery for Cancer

With Mr G GORDON TAYLOR (London) in the chair, Mr RALSTON PATERSON (Manchester) said that malignant growths could be divided into three groups The first were curable or at least treatable The second responded to palliative radiotherapy and the third group were so far incurable Into the first group came malignant disease of uterus and vagina, skin, breast, and mouth and tongue These were easily diagnosed and could be successfully treated if attacked in the early stages Incurable malignant disease occurred in liver, pancreas and lung Here even palliative radiotherapy was useless Radiotherapy was contra indicated in cancers of the gastro-intestinal tract and connective tissue and osteogenetic sarcomata and more advanced malignant disease It was often difficult to persuade doctors that in these radiotherapy was unsuitable even as a palliative measure Radiotherapy had a limited value in carcinoma of the pharynx, bladder and prostate, œsophagus, lung and brain, but it occasionally relieved symptoms for months or even years. It was the treatment of choice in embryonal tumours, some tumours of the thyroid and salivary glands, and tumours of reticulo endothelial origin There were cases where radiotherapy could be helped by surgery, such as growths of the mouth, skin, bladder, cervix and antra Cases where surgery was the dominant treatment, and radiotherapy of value, were growths of the breast, lymph glands and body of uterus, and giant cell tumours of bone Sometimes borderline cases could be made operable by deep X rays, for example, mixed tumours of the parotid gland Early diagnosis and treatment of the curable cancers of the breast, mouth, uterus and skin were essential The public should be educated to recognise the early symptoms

Plastic Surgery and Facial Injuries

Mr A H MCINDOE (London) said that what the motor car did today war might do tomorrow Early treatment of facial injuries was most important and frequently prevented grave permanent disfigurement Injuries could be divided into those with no gross loss of substance and those with considerable tissue loss requiring some sort of graft later Treatment in the second type was palliative Abrasions with ingrained grit or powder should be treated by immediate removal of all the foreign material with

a sharp curette. Débridement was less important in the face than elsewhere thanks to the very profuse blood-supply. Heavy suture material should be avoided as the suture marks were very difficult to remove. Eyeless needles should be used. Fractures of the zygoma and nasal bones were extremely disfiguring and demanded immediate treatment He described an emergency splint for the upper jaw made from a dental impression tray and interdental wiring for fractures of the mandible. The treatment of gross compound injuries was palliative and no attempt to graft tissues should be made until the danger of sepsis had completely vanished.

Surgical Treatment of Hypertension

Prof. J R LEARMONTH introduced Dr W. McK. CRAIG (Mayo Clinic) who said that there were three factors in the maintenance of the blood-pressure—viscosity of the blood, propulsion, and peripheral resistance Of these only the third could be altered surgically. Recently hypertension had been artificially produced in animals by compression of the renal vessels In 85 per cent. of patients hypertension was primary; in the rest it was secondary to some other condition such as coarctation of aorta, chronic nephritis or suprarenal tumour. In primary or essential hypertension heredity was an important factor. Cold water and Pentothal sodium tests could be used to determine the upper and lower limits of the blood-pressure. Potassium thiocyanate treatment was useful especially after sympathectomy, but it was a very toxic drug, and must be used with extreme care. In 237 cases treated surgically there had been no operative mortality. Many cases which were now treated by operation might be treated medically within the next decade.

Mr. L. R BROSTER (London) thought that there was not enough coöperation between physicians and surgeons in dealing with cases of hypertension

Mr. J. B. OLDHAM (Liverpool), in his experience of adrenalectomies, had found that the blood-pressure rose again after a time Denervating the kidney did not make any difference to the blood-pressure.

Mr. NORMAN LAKE (London) had done sympathectomies for other reasons and found that the blood-pressure had risen after some years.

Dr. CRAIG described the operation of subdiaphragmatic sympathectomy in detail, and illustrated it with a short film in colour.

MORAL REARMAMENT

A RECEPTION was held in Aberdeen on July 22 by Sir John and Lady Orr and Dame Louise McIlroy at which Sir John Orr presented the following resolution:—

We, members of the British Medical Association, believing that many diseases and much physical and mental suffering are caused by morbid fears, worries and hatred, by bad housing, bad diet and anxiety due to poverty, and believing that moral rearmament will create a new spirit of justice, love and respect for the dignity of the common man which would lead to the abolition of these diseases, resolve to equip ourselves morally and spiritually and to give full support to all efforts to apply the resources of science to the building up of a new world in which men will be able to attain their fullest inherited capacity for physical, moral and spiritual development.

Evidence was given of moral rearmament applied to medical practice and a film was shown which illustrated the effect on youth of a new physical and moral fitness

Dr. E. E CLAXTON, of Folkestone, laid stress on the part the profession could play in the international sphere Medicine, he said, knows no national barriers, and our training in accurate diagnosis and treatment could be applied to the world's unrest as much as to disease The doctor, with his natural access to the homes of the nations, could in fact tackle these problems at their source.—Dr. DONALD COURT, registrar to the children's department of Westminster Hospital, showed how moral rearmament had produced a new kind of contact with the staff, the patient and the general practitioner, and enabled him to deal effectively with the nervous child —Dr. ALEXANDER MUIRHEAD, regional medical officer of health, gave instances of the new coöperation between both colleagues and rivals in Eastern Scotland which had resulted from moral rearmament, and Dr. MARY MACNICOL, of Edinburgh, spoke especially of its application to general practice — One of the guests, Mr. ROLAND WILSON, of Oriel College, Oxford, showed how moral rearmament was rapidly becoming a world force and exerting a constructive influence on national policy both in Europe and the Far East

A message has been addressed to American citizens at the World Assembly for Moral Rearmament at the Golden Gate Fair, San Francisco.

In the continuing uncertainty of world affairs, it says, medical practitioners in common with others are deeply concerned to restore the security essential to normal living. It is vital to create confidence during an emergency, but even more urgent to prevent catastrophe and to lay the foundation of a just and lasting peace. Science has made great advances, but without corresponding moral progress we risk losing even the benefits already achieved. Behind much disease as behind world unrest are fear, self-indulgence, jealousy and resentment. These are problems for which Medicine might provide a radical solution. It is still our privilege to enjoy unrivalled contact with the homes and people of the nation. Our immediate task is to teach men that health is not the mere absence of disease but includes a moral and spiritual foundation for life and the replacing of conflict and apathy with a purpose that claims the whole personality in the service of our fellows.

A growing body of people in many countries is calling for this "moral rearmament" to provide the discipline and the direction needed by both individual and nation. Our profession can give a lead to such a programme which is in accord with the highest ideals of our tradition. To achieve it we realise that the highest standards of honesty and unselfishness must be the touchstone of our professional and private lives Only through insistence on these spiritual values will the resources of science be liberated and a new world built in which men can attain to their inherited capacity for physical, moral and spiritual development.

This manifesto is signed by: Dr. G. C Anderson, Sir Thomas Barlow, F.R.S., Lady Barrett, Sir Henry Brackenbury, Dr. H. Guy Dain, Mr W. McAdam Eccles, Dr. Thomas Fraser, Prof. John Hay, Lord Horder, Prof. Geoffrey Jefferson, Prof. R W. Johnstone, Prof. John Kirk, Dr Colin Lindsay, Sir Ewen Maclean, Dame Louise McIlroy, Sir John Orr, F.R.S., Prof Leonard G Parsons, Dr. Donald Paterson, Prof Lambert Rogers, Sir Humphry Rolleston, Mr. Cecil P. G. Wakeley, Sir Beckwith Whitehouse, and Prof. Samson Wright.

REVIEWS AND NOTICES OF BOOKS

Royal Northern Operative Surgery

By the Surgical Staff of the Royal Northern Hospital London H K Lewis and Co 1939 Pp 551 42s

Like all multiple-author books the standard of writing and of the selection of matter for inclusion varies very much, but it can be said with confidence that the average is high The book is an attempt to describe one reliable operative procedure for each common surgical condition Rarely performed methods and those under trial are not in the main described This is one point we would select for special commendation The newly fledged surgeon is saved from the dilemma of choosing a suitable operation from a number of what may appear to him equally desirable and effective procedures

There are two sections which are particularly helpful and practical, those on affections of the rectum and on thoracic surgery Here the authors give easily followed directions for carrying out the operations they describe, but this cannot be said of all the contributions One suspects that mucoeiasis of the gall bladder described by Thorek is seldom performed at the Royal Northern Hospital The follow-up of gastric cases does not appear to have been done very carefully, since a simple separation of the jejunum from the stomach for gastrojejunal ulcer finds a place in the treatment of this serious complication of gastrojejunostomy for duodenal ulcer The operation of partial gastro duodenectomy, which for years has now been established as a more reliable operation than gastrojejunostomy, is not even mentioned In the chapter on kidney operations there is an excellent description of subscapular nephrectomy—in Swift Joly's own words It is questionable whether resection of the pelvis in hydronephrosis operations is generally desirable A surgeon seeking for information about auricular fibrillation after a thyroidectomy will meet with a disappointment for he is told, in all simplicity, that "a physician should be summoned" There is a curious omission of the name of R E Norrish in the list of contributors on one of the front pages, yet in the preface he is thanked for invaluable assistance and for his own contributions

Apart from a few such criticisms there can be nothing but praise for this new book Particularly will it be helpful to surgeons early on in their career The methods described are practical, sound and reliable Operative instructions are clear and the illustrations very good

Angina Pectoris

Nerve Pathways, Physiology, Symptomatology, and Treatment By Hermann R Miller, M.D, attending physician, Sydenham Hospital, associate attending physician, Montefiore Hospital, New York City London Baillière, Tindall and Cox 1939 Pp 276 15s

Dr Miller has approached angina pectoris from an anatomical rather than from a physiological point of view, for his chief interest lies in the nervous pathways by which cardiac pain is transmitted The justification for this interest lies in the success of attempts made to relieve angina pectoris by surgical interruption of the afferent nerves from the heart The book contains 31 valuable charts illustrating the complicated anatomy of cardiac innervation, and also a useful discussion of the various surgical manœuvres which have been employed in the treatment of angina pectoris But the stressing of the importance of the nervous pathways has resulted in the comparative neglect of the factors fundamentally responsible for the pain The consideration of the actual cause of cardiac pain occupies but two and a half pages of the book, and acute myocardial infarction is hardly distinguished from an attack of angina pectoris This anatomical bias, however, is a corrective for those who regard angina pectoris as a question of muscle ischæmia and hypothetical "P" factors The book ends with an attempt to study individual experiences of pain and reactions to it, a problem which must occupy anyone who has seen unbearably painful cardiac infarction in one case and the same thing apparently painless in another

Civilization, War, and Death

Selections from three works by Sigmund Freud Edited by John Rickman, M.D Camb London Hogarth Press, and Institute of Psycho Analysis 1939 Pp. 102 3s 6d

The publication of these selections at the present time is peculiarly appropriate The book shows Freud as an essayist rather than as a psychologist, and, as the original works were intended for the layman, the extracts can be read by those who have no special knowledge of medical psychology There is much in them which reveals the profound thinker and humanitarian, with a mind aloof from nationalism Freud presents the motives of mankind as he sees them without emotion Dr Rickman's choice of selections shows that he has a deep knowledge of the work and a sincere regard for the writer, and he is to be congratulated on the skill with which the choice is made The original German has been translated into readable, literary English

Physiology of Exercise

(3rd ed) By James Huff McCurdy, A.M, M.D, M.P.E, director of physical education course in Springfield College, Massachusetts, 1895–1905, and Leonard A Larson, B.A, B.P.E, M.Ed, Ph.D, professor of health and physical education at the college London: Henry Kimpton 1939 Pp 310 17s

It must be a source of mystification to our American colleagues that there is nothing analogous to their organisation for the scientific study of athletics in this sport loving country In the United States the universities and other centres of education maintain their professorial chairs and their directorships of physical education with faculties, degrees and diplomas Here, on the other hand, any investigations are left to a few voluntary enthusiasts And yet we are entitled to claim contributions to the subject of the physiology of exercise which are far from insignificant The late Professor Bainbridge, for example may justly be regarded as having established fundamentals which will stand for all time

With subsidised research, a large body of workers, and unlimited material, it is not surprising that an immense literary output is forthcoming from the United States, and an outstanding feature of this book is the number of references to American work Its full bibliography is perhaps its chief recommendation, for, after the interesting introductory chapters, much of the material set out will be of little value except to the research worker The jerky staccato style

makes study difficult. Nor is a sense of proportion maintained. Thus eleven tests for cardiovascular function are fully described, not one of which has any advantage over the simple observation of the effect of change of posture on the cardiac rate and blood-pressure (mentioned in Sir Adolphe Abrahams's paper on p. 309 of this issue), and twenty pages are devoted to figures dealing with "organic efficiency tests," whereas "stitch," which is of the greatest interest to many athletes, is dismissed in nine words, in an explanation which is almost certainly incorrect. An oxygen debt of roughly 3½ litres per minute is said to have been incurred during a four-mile boat race. This would mean a total oxygen debt of over 70 litres, whereas A. V. Hill has shown that the maximum debt ever estimated in a very exceptional subject was about 20 litres Such statements show a lack of critical scrutiny which is both surprising and disappointing in such authorities.

Protein Metabolism in the Plant

By ALBERT CHARLES CHIBNALL, Sc.D. Camb., F.R.S, professor of biochemistry, Imperial College of Science and Technology, London. London: Humphrey Milford, Oxford University Press. 1939. Pp. 306. 18s.

THIS book, which is the twenty-seventh volume in the series published by the Silliman foundation, maintains the high standard set by previous writers Professor Chibnall has divided his subject in a natural manner into the protein metabolism of the seedling, and that of the leaf After a historical review of the earlier researches, he emphasises the effect on the course of protein synthesis according to the form of nitrogen provided In dealing with the leaf, he describes the reactions involved in his ether-water method of isolation This method has revolutionised the chemistry of leaf proteins, and is an example of the truth that advances in science depend upon the evolution of new methods. In dealing with leaf-protein metabolism the author has allowed himself a certain latitude and may not find other workers in this field agreeing with him. He includes also a discussion on the reason for the difficulties encountered in isolating proteins from the leaves of pasture plants His description of the course of protein metabolism in the leaf, including as it does data obtained from detached leaves as well as those kept in the dark, is highly stimulating The labile character of the proteins of leaves is well known, and the chapter on the regulation of the metabolism in the leaf provides much food for thought

The value of the book is enhanced because the author, while using his skill as a chemist, has considered his material as living material The book should therefore appeal to all biologists and especially to the physiologist

---

Endocrinology in Modern Practice

(2nd ed) By WILLIAM WOLF, M.D, M.S, Ph D., endocrinologist to the French Hospital; attending endocrinologist to the Misericordia Hospital, New York City. London: W. B. Saunders Company. 1939. Pp. 1077. 45s.

IN this book the author has successfully compressed the vast and diverse information available on the endocrine glands, and has produced what is perhaps the best general textbook on the subject in the English language Thanks to rapid experimental advance, large sections of a book on endocrinology may be out of date in as short a time as a year. So in this second edition extensive revision has been necessary. Among the new subjects are sections on zinc-protamine insulin, the hypoglycæmic states, and endometrial suction biopsies. Perhaps owing to the peculiarity of examinations the student is well acquainted with the rarer disease syndromes of the anterior pituitary or the adrenals, but knowledge of obesity, the menopause, sterility and menstrual disorders is often very slender. Dr. Wolf gives these important practical problems the space they deserve.

The book has one serious omission; in all its 1077 pages there is not a single reference to the literature Inevitably this leads to dogmatism on controversial matters, so that in places it is difficult not to disagree fundamentally with the author. It is not suggested that a complete bibliography should be presented in a volume of this sort, but a critical selection of the more important papers would have been of great value, and might well have replaced the rather useless summaries at the end of each chapter or the 33 pages devoted to symptom diagnosis.

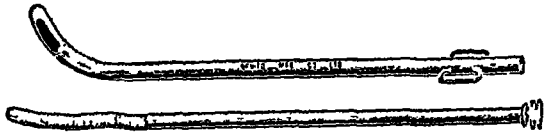
As the title implies, this book is written mainly for the practitioner, but it will appeal also to the student wanting a general introduction to endocrinology For either audience, however, it seems a mistake not to put all sides of the question at a time when the therapeutic application of endocrine preparations is fraught as much with danger as with advantage.

NEW INVENTIONS

A CLOT-EVACUATING CATHETER

FOR severe cases of clot-retention the Bigelow evacuator is of unquestionable utility The technique of this generally requires the operating-theatre and a general or spinal anæsthetic

I have used the instrument here illustrated long enough to have proved its value It was made to my design many years ago by the Genito Urinary Manufacturing Company Essentially it is a catheter which can easily be passed after Novocain has been injected into the urethra and is made in two sizes, 24 Ch and 27 Ch It has two very large laterally placed windows (22×6 mm). A flexible lobster-tail



obturator, which fits snugly but not tightly, closes the windows and allows introduction without trauma The most important function of the obturator is to act as a suction piston, for on sharp withdrawal solid clots can be evacuated in rather a remarkable and unexpected way. Perseverance in this, with occasional introduction of an ounce or two, gradually increasing as the bladder becomes freed of clots, of a 1 in 10,000 solution of nitrate of silver with a Thomson-Walker syringe, will eventually clear the bladder completely. A preliminary injection of morphine will increase tolerance, and no further anæsthesia other than novocain locally is required. The whole performance can easily be carried out in the patient's bed

Many a time I have cleared a bladder distended to the umbilicus with apparently almost solid clot, with far less constitutional disturbance than that associated with the requirements of the Bigelow's evacuator; it is also much simpler.

THE MESS OF MEDICAL LITERATURE

In a recent book H G WELLS tells of an amazing man who attempted to tidy up the mess of fundamental thought throughout the ages His hero, William Burroughs Steele, gave his life to the exposure of "habitual piecemeal thinking" and being frustrated took an overdose of sedative, leaving as his dying message the words "We make a pattern better than we know Keep on with it" It is a story that may well haunt the student of medicine who is perpetually frustrated, in his urge to fit his own work into a general scheme of knowledge, by the mess of medical literature A lively correspondence in our own columns was opened by Professor McDOWALL with the statement that the present state of medical literature is chaotic to a degree that leads young and enthusiastic investigators to waste their energies on doing work which would be unnecessary but for lack of coördination in presenting the work of others He was the more entitled to say this, having himself made a brave attempt to provide [1] a sign-post to one section of medical knowledge—the physiology of the circulation The various librarians who have taken up his challenge agree in the urgency of the difficulties if not in the method of their solution, and it may be the time has come to consider possible solutions of a problem which faces writers and librarians and readers alike The problem itself was stated in a leading article not long ago [2]

A beginning might be made in three directions (1) some measure of control over the volume of medical periodical literature, (2) an effort to ensure complete indexing of the contents of medical periodicals and books, (3) cooperation between abstracting journals to secure completeness without overlapping Whenever an author is following up work already published Sir WILLIAM BRAGG has suggested it would generally be enough to print a summary instead of a full dress article, provided that a type-written or photostatic copy (or even a microphotographic film) is available for other workers in the same field who alone require the details Reduction in the number of circulating periodicals would require an international convention with the power to eliminate and to act as a court of reference on the need for a new periodical Utopian though it may appear this would be the rational method of reducing the volume of scientific literature, and the time is approaching when an attempt along these lines must be made Without waiting for this time someone should get on with an indexing journal of medical science and practice which would list all periodical literature and notice all new books published At the present time we are indebted to the United States for the two great indexes the Quarterly Cumulative Index Medicus and the *Index Catalogue of the Surgeon General's library*. But the Index Medicus does not include all existing medical periodicals nor the titles of all the articles in the indexed periodicals The Index Catalogue is even less complete, invaluable as it is for early records If the Index Medicus is to continue as our main reference to scientific literature, there should be international coöperation to ensure its completeness, with a subsidy from every country proportional to the number of titles listed from its journals

The third part of the problem is more difficult The cost of abstract-journals is high, a complete set would cost a library at least £300 a year Actually there is much overlapping and the complete medical field is not covered Eleven of the abstract-journals dealing with clinical medicine are due to the enterprise of one German publisher and their total cost is slightly more than half of the cost of all the abstract-journals published in the world Here is an equally clear case for international coöperation, without it the investigator cannot hope to find the abstracts within a reasonable time of publication But even if the investigator had a complete indexing tool and a complete range of abstract journals at his disposal, he would still need a specialised directory, on the lines of the general "Subject Index to Periodicals," to tell him where each of the periodicals he wishes to consult is to be found Each country should possess a complete collection of all medical periodical literature or, if not a complete set, an arrangement whereby some photographic reproduction of the article in the missing journal can be secured, and no country in the world at the present day has such a set In Great Britain no existing library could afford to take on the task The universities and research section of the Library Association is however attempting to compile a directory of what is available here and there in the United Kingdom This is an extension of what was begun by Professor LEIPER fifteen years ago, but unless the necessary funds are forthcoming soon the project must fail In London, as has been noted in the correspondence, four medical libraries have agreed to a common policy in order to reduce duplication and to pool their resources for the benefit of investigators in the four institutes We may hope before long to have a list of the periodicals available in these four libraries, other London libraries will then no doubt enter the common pool. The critical factor is the poverty of medical libraries For half a century the burden on their staffs and budgets has been piling up Small staffs and small budgets lead to inefficiency and waste The medical library is as essential a tool in the advancement of medical knowledge as is the research laboratory In a sense it is the master key. To clear up the mess of medical literature two things are needed—the pioneering spirit and a reckless buccaneer factor

YOUNG ADULT PHTHISIS

DURING the present century young adults have not shared in the general decline of the death-rate from respiratory tuberculosis This disquieting exception, noticeable especially among young women, has attracted much attention, but without as yet any satisfactory determination of the factors responsible—though the features of modern life incriminated have been numerous. In the last few years the reports of the Registrar-General for England and Wales have shown a distinct turn for the better. For young adult males the renewed decline in their phthisis mortality has been such that in a few years the death-rate may be as low as if no set-back had taken place in the war and post-war years Young adult females also show a material fall in mortality since 1931, but their death-rate is still considerably higher than it would have been if the trend of the latter half of the nineteenth century had been continued. Compared with the males the set-back in their rate of mortality was much more severe and, it is important to realise, certainly took place before the war. Between the decades 1871–80 and 1891–1900 the recorded death-rate from phthisis for females at ages 15–24 years was halved; between 1901 and 1931 it showed scarcely any improvement at all; in the war and post-war years there was a considerable rise. Even if the present more favourable trend should be continued, it is clearly of interest and importance to elucidate the causes of the previous set-back, for which the exceptional conditions of the war years cannot be held wholly responsible. Obviously no simple solution is likely; many factors may well have played a part and the difficulty lies in determining their relative importance This is the particular merit of the statistical study made by Dr. D'ARCY HART and Professor PAYLING WRIGHT,[1] now published with a commendatory note by Sir ARTHUR MACNALTY. Their work has developed along two lines. Taking England and Wales as a whole they have first set the mortality experience of the two sexes at various ages against the measurable changes in social conditions which have occured in the last 90 years. Secondly they have made a more intensive examination of the differences in mortality, particularly in that of young women, experienced between one urban aggregate and another during the past quarter of a century.

Under the first heading they have examined the trend of phthisis mortality at different ages, between the years 1850 and 1936, in relation to the course of real earnings They show that the mortality curve for young women matched the latter curve most closely, while that for young men came next. From this they conclude that young adults and especially young women may be particularly sensitive to changes in the standard of living and suggest that this may be the effect of combined environmental and biological causes —"the stress and strain of industrial occupation during the important formative period of adolescence and early adult life." Lack of comparative data prevents them bringing the standard of housing into the picture before 1891, but they note that the check to the rise in the standard of living that occurred in about the year 1900 was accompanied by a set-back in the improvement in general housing conditions. At much the same date there was an accentuated increase in the industrial employment of young women. A better examination of the possible importance of these factors lies in their second line of inquiry—into local differences in mortality and environment. For this purpose Hart and Wright have investigated the experiences of the county and metropolitan boroughs. It has been pointed out by previous workers that such local differences may in part be due to the selective migration of young adults; for example in the north of England the death-rates of the towns might be artificially raised by a reduction in recent years of a physically fit immigrating population and an additional loss of the more healthy members of the population by their emigration in search of work. Such effects would obviously weaken the comparison between recorded death-rates and environmental conditions.

From various statistical tests the authors, however, are satisfied that migration could not fully account for local differences in mortality, and that between 1921 and 1931 it can have played relatively little part in producing the very considerable differences in mortality shown by the English county boroughs. Such differences are found to be related, as might be expected, to general measures of poverty, and subdivision of those measures puts most weight on the prevalence of inferior housing, implying differences in closeness of personal contact. The special effects of housing on young adult females are suggested by the following percentage changes in phthisis mortality between 1911 and 1931: females, all ages, best housed towns, decrease of 34 per cent., worst housed towns, decrease of 26–30 per cent.; females aged 15–24, best housed towns, decrease of 22 per cent, worst housed towns, increase of 10–14 per cent. The influence of housing conditions on the improvement in phthisis mortality of young adults is further shown in the finding that in two groups of badly housed towns one had shown over 40 years a distinctly greater rate of improvement in its housing and a concurrently greater decline in its phthisis mortality at ages 15–24 than had the other. The authors, therefore, conclude that differences in housing conditions from one locality to another are a very important factor in producing the differences both in the present levels and in the recent changes in phthisis mortality among young adults in the English county boroughs In London this association with housing is very slight but it is probable that the housing index of a metropolitan borough is not an adequate measure of closeness of contact for an age-group, many of the members of which spend a large part of the working day elsewhere. Published data derived from the special surveys

1 Tuberculosis and Social Conditions in England: with special reference to young adults A statistical study by P D'Arcy Hart, M D, F R C P, and G Payling Wright, D M, M R C P London: National Association for the Prevention of Tuberculosis Pp 165 3s

of poverty and social conditions in London made it possible, on the other hand, to relate the phthisis death-rates of its areas to such other components of the standard of living The information suggests that other factors in poverty, such as inadequate nutrition, are also influential On the whole, however, Hart and Wright incline to the view that a working man with an increase in income would better guard his family against phthisis by spending the extra on improving their housing rather than on their food At the same time they are careful to point out that no single cause will explain the present incidence and previous retardation in decline of phthisis mortality in young adults There is undoubtedly a complex interaction of a number of factors, though amongst them Hart and Wright are not inclined to place the alleged decreased tuberculisation in childhood with a resulting reduced immunity in adolescence

Put very briefly their general conclusions may be stated thus At about the turn of the century the lack of improvement in the standard of living, and in housing, and the increase in the industrial employment of young women had a deleterious and selective effect upon the phthisis mortality of young adults, the sharp deterioration in the standard of living, and the food shortage, of the war years converted the already slackened rate of decline into an actual increase, these unfavourable reactions were unevenly distributed and can be shown to have been especially severe where social conditions, and most particularly housing, were poor

THE DEBT OF SURGERY TO THE MAYOS

IN the artists' room of the Mayo Clinic there is a skeleton At first sight it seems a commonplace object, an artist's model, but, if one knows its history, it expresses something of the romance which centres round the "Medical Mecca of Minnesota" The skeleton is that of an Indian chief who took part in an attack on Rochester at the time when the father of WILLIAM and CHARLES MAYO was the doctor of the little town The doctor's portrait is there too—a sturdy bearded figure driving in his buggy through the shack-lined street of a typical settlement of the Middle West How great is the change today! Rochester is a town given over to the pursuit of medicine Great buildings house its clinics and accommodate its patients, great halls provide the auditorium for lectures and graduations, there are experimental farms and magnificent laboratories, and in all these are men and women, gathered from many lands, paying a tribute by their presence to this American creation

But the MAYOS did something more than create a great medical centre, they laid down a principle Disease may have its beginning as a single and individual thing, but it soon has repercussions, and today all agree that the ideal estimate of serious illness should imply a review of all systems —a collective study centring on the local error This conception did not originate with the MAYOS but it was they who first established the organisation needed to act on it consistently And they did more, for they brought its benefits within the reach of all, whatever their status and position. By applying the rule of payment according to means they maintained their patient's independence while ensuring the economic success of their experiment, and the plan was one that commended itself to their individualist and democratic fellow citizens On the professional side an essential element in their progress was their ability to pick out, and attract, young men of promise and distinction, and in so doing they built up a team and a succession of teams that have maintained the standard first set Today the surgical world has many leaders who owe their training and their efficiency to the lessons learnt in the Mayo Clinic, thanks in part to the system of fellowships and scholarships established there by the characteristic generosity of the founders

Of their individual contributions to surgery it is difficult to write Their motto might well be *ubique*, for at one time or another they influenced and advanced a great variety of surgical conditions and procedures The name of W J MAYO will always be associated with the surgery of duodenal ulcer With the late Lord MOYNIHAN he may be said to have crystallised current knowledge of this condition and to have put its surgery on a sound and reasonable basis, in the same way his work on diverticulitis will be remembered as a model of clinical accuracy and scientific reasoning CHARLES MAYO's name is attached particularly perhaps to the surgery of the thyroid gland, which he popularised in the United States; but among such a plethora of contributions it seems futile to discriminate there seems no end to the record, and to get an idea of the versatility of these two men it is only necessary to turn over the pages of such a book as Binney's "Operative Surgery" The real debt of surgery to the MAYOS, however, is not so much in advances of technique or clinical observation as in something bigger In matters surgical they made the wilderness blossom as a rose, and they have left behind them high ideals, sound principles, useful methods, and a body of men enlivened by their courage

NEW WHITE CITY

LONDON'S biggest landlord the L C C, has launched a project worthy of socialist Vienna On the site of the old White City exhibition a new town of homes for more than 10,000 people is taking shape In 1935 the council decided to acquire the site for housing purposes Of the 62 acres, 45 have been set aside for flats, in all 2166 flats in five story blocks are contemplated One year ago construction began On July 21 the Minister of Health opened the first section—1193 flats, with 3910 rooms, for 5800 people Accommodation varies from one to five rooms The larger flats have their own sun balconies and fitted kitchens connecting with the living rooms by sliding doors Gas water heaters gas cookers and gas-ignited coke grates are installed Rents will range from 6s 6d (exclusive of rates and water charges) for a one room flat including kitchen recess bathroom and lavatory, to 17s 6d for a five room flat As an integral part of the scheme there will be schools and playgrounds, a clinic and a doctor's house, churches, an inn shops, a community centre, an administration building and reading rooms

ANNOTATIONS

A WOMAN FOR THE G.M.C ?

"JUSTICE," said Lord Darling, "is, like the Ritz, *open to all*"; and membership of the General Medical Council is open to women. Indeed one woman was elected to it some years ago as a direct representative of medical practitioners in England and Wales, though she died before taking her seat As was pointed out at the B M A meeting in Aberdeen last week, any electing body can choose a woman, and if a woman is wanted the machinery for her election is fully available. No doubt that will satisfy the formalists; but in actual fact the immediate chances of a woman being elected to succeed Christine Murrell on the G M C. are little better than those of a woman succeeding Elizabeth Blackwell as a student of St. Bartholomew's Hospital. The B M A. was assured by several representatives, including the only woman speaker, Miss Beatrice Turner, that females desire no more than equality of opportunity, which (it was said) they already possess How far this self-mortification is really prevalent among women doctors we do not pretend to judge, but we are not enamoured of machinery that does not work, and to any practical person interested in making the G M C more representative it must seem an anomaly that in a profession with 6000 women members (out of 60,000) there should not be a single woman in the council of 39 which directs its education and discipline. All questions of administration and politics concern women as much as men; they are equally interested in the welfare of the community; and there is no doubt that their judgment and experience would be of value in the penal and disciplinary work of the council Women are often called as witnesses; many of the complaints may be against women; and in all the really difficult cases women are concerned in one way or another Of the existing council 27 are nominees of licensing bodies, which are unlikely to put in a woman, however eminent, as their only representative, and 7 are elected as direct representatives of practitioners in the several parts of the United Kingdom. Dr. Murrell was herself chosen as one of these representatives · before her election she had been a member for fifteen years of the metropolitan branch council of the B M A. and had presided over it; for eight years she had been a member of the B M A. council and she had served on fifteen of its committees and subcommittees Her record of public work was outstanding and it may well be beyond the compass of later candidates At all events the B M A. meeting, despite a motion that one of the nominees of the association should be a woman, decided at Aberdeen on male candidates, Mr. Bishop Harman and Dr. E A. Gregg, for nomination to vacancies in the near future for direct representatives There remains the fact that the Privy Council has the disposition of 5 seats, which it allots to supply the council with members from branches of the medical profession not otherwise represented there. It was the Privy Council which, in response to parliamentary pressure, and very wisely, appointed a lay member of the council, and we hope it will take the next suitable opportunity to fill this other conspicuous gap

OCCUPATIONAL THERAPY

THE latest addition to the facilities for occupational therapy in Bristol is the Allendale Curative Workshop where equipment has been installed for treating patients, both "hospital" and private, at all stages of physical disabilities caused by accident or disease. The workshop, which is under the care of the staff of the Dorset House school of occupational therapy, will ultimately be developed into a full-time rehabilitation centre and a number of patients from the local fracture clinics have already passed through it. Last year Dr. Elizabeth Casson (*Med Pr.* 1938, 197, 265) outlined the work that has been done in this field for patients suffering from nervous disorders at Dorset House, for cases of rheumatic heart-disease and other medical conditions at Bristol General Hospital and Southmead, for cases of pulmonary tuberculosis at Ham Green, and for orthopædic cases at Bath Orthopædic Hospital She laid down four principles on which the use of occupational therapy is based First, it must be prescribed by the patient's medical practitioner in categorical terms Secondly, the prescription must take due regard both of the individual patient's mental and physical make-up and of the nature and extent of his disability. Thirdly, it must be carried out by a specially trained therapist who has the necessary knowledge of anatomy, physiology and psychology, and a wide experience of crafts and occupations Fourthly, it must be sufficiently engrossing to direct the patient's attention away from his disability. Dr. Casson urged that, apart from its use in hospitals and institutions, there is a wide opening for occupational therapy among private cases, where it can be provided by the hour in the patient's own home, in the same way that massage is given.

CONSTRICTIVE PERICARDITIS

FOUR years ago a paper by White[1] in these pages excited considerable interest in the syndrome of chronic constrictive pericarditis, and since then a number of operations have been performed for the relief of an otherwise incurable cardiac disability. The publication by Heuer and Stewart[2] of seven consecutive and successful operations of this kind merits attention because it brings out several new points in both diagnosis and treatment. The improvement they describe and illustrate by photographs is so striking that their paper should also help to remind the practitioner of the existence of the syndrome and the necessity of taking it into account in all cases of persistent ascites The presence of a pericardial scar should always be suspected where there is ascites and enlargement of the liver in the absence of the commoner causes of congestive heart failure The diagnosis is established by direct measurement of the venous pressure, which is always increased, and by a series of other findings, which include a pulse that is small in volume and an electrocardiogram of low voltage. The radiograms show a cardiac silhouette that is either smaller than normal or at the most moderately enlarged, and in some cases deposits of calcium may be clearly seen especially in the lateral view. Under the fluoroscope it may sometimes be observed that contraction of the several chambers of the heart is much diminished. In the cases recorded by Heuer and Stewart careful medical treatment preceded operation, the measures employed including complete rest in bed on a diet low in salt-content but with a high protein component Paracentesis of the ascitic fluid was also carried out, and free fluid

1 White, P D., *Lancet*, 1935, 2, 539
2 Heuer, G J., and Stewart, H. J., *Surg Gynec Obstet.* 1939, 68, 929

in the tissue spaces was eliminated as far as possible by giving Mercupurin intravenously The operations were done under oxygen and ether by the intratracheal method, so that positive pressure was available in the event of laceration of the left pleural reflexion The pericardium was exposed by resection of the second to the fifth costal cartilages together with short segments of the corresponding ribs on the left side, and it is Heuer's practice to preserve the perichondrium and periosteum He finds it possible after freeing the pleura from the left surface of the pericardium to obtain access to the right surface of the heart by depressing the heart so that there is a space between it and the sternum The pericardium is incised over the left ventricle This chamber is freed and then the dissection is carried out over the right ventricle No attempt is made to free the pericardium above the level of the auriculo ventricular sulcus The wound is closed without drainage Several interesting facts emerge from the detailed case histories In one instance microscopical examination showed that operation had been done for a tuberculous pericarditis, yet contrary to general experience the patient was cured In another patient improvement was gradual and the cardiovascular derangement did not completely disappear for a year but more usually the effects of the operation were immediate This is one of the few procedures, either medical or surgical, capable of transforming a bedridden patient into a man fit to engage in vigorous athletics

NERVOUS COMPLICATIONS OF SULPHONAMIDE THERAPY

ADVANCES in chemotherapy seem inevitably to be followed by a tale of sporadic mishaps and the sulphonamides have not enjoyed exemption in this respect A variety of complications have been reported ranging from blood changes, such as sulphæmoglobinæmia, acidosis, anæmia and leucopenia, to skin rashes of different kinds with or without features suggestive of serum sickness and these have lately been reviewed by Holman and Duff[1] Their comment that the nervous system in man is in general little affected by these drugs is undoubtedly correct, but Dr J H Fisher and Dr J R Gilmour show in their paper on p 301 of this issue that the central nervous system is not immune Their fatal case is of considerable pathological interest in that the spinal cord, which alone was affected, showed changes that have previously been described after antirabic treatment and spinal anæsthesia and in encephalomyelitis following smallpox Perivascular areas of demyelination were a conspicuous feature That these were secondary to vascular damage is strongly suggested by the necrosis and inflammatory infiltration of certain of the thrombosed vessels The massive softening of the lumbar enlargement is thus explicable as an infarct and the term myelomalacia is a suitable term for this condition rather than myelitis, which implies a primary inflammation

Why such a pathological sequence should crop up as a rare complication of some disease or form of therapy it is difficult to understand, in attributing it to idiosyncrasy we advance no further It has been argued that such reactions are allergic While this explanation does not cover all the observed facts in the reported cases it may reasonably be advanced in connexion with Fisher's two patients In these symptoms of nervous complications arose 14 and 6 days respectively after the administration of sulphonamide was begun, a period at which an antigen antibody reaction might be anticipated The possibility that the sulphonamides may have some antigenic effect can hardly be doubted in view of the demonstrations by Landsteiner and his co-workers of such properties in organic compounds of relatively simple composition notably the arsphenamines The pathogenesis of the encephalomyelitis that may complicate vaccination, smallpox and measles has never been satisfactorily elucidated Efforts to demonstrate virus activity by transmission experiments have failed and have failed once more in Fisher's first case The possibility that all these conditions are dependent on sensitisation has been suggested on clinical grounds and deserves further consideration

1 Holman W L and Duff G I *Amer J med Sci* 1939, 195 379

JOHNS HOPKINS JUBILEE

IN May, 1889, the Johns Hopkins Hospital was opened and fifty years later its famous Bulletin[1] has reprinted the addresses given at the opening by the three men who translated Hopkins's ideas into fact Johns Hopkins, as Francis King, John Billings and Daniel Gilman told their audience, wished that his hospital should compare favourably with any in his own country or Europe He was careful to leave his trustees almost entire freedom in their methods and designs In two things only he anticipated their decisions, he provided a splendid site and willed that his hospital and medical school should constitute the medical department of his university The board of trustees were worthy of his confidence As we look back on this half-century and read in their own words the hopes and aims which inspired them there rise again to our minds the old familiar phrases—"Wisdom hath builded her house, she hath hewn out the seven pillars through wisdom is an house builded, and by understanding it is established, and by knowledge shall the chambers be filled with all precious and pleasant riches" The fame of Johns Hopkins has gone out into all lands, and the aims and inspiration of the founder and his trustees have proved a beneficent stimulus to medicine throughout the civilised world Johns Hopkins dreamed a dream, as did Rahere in an earlier century, and his dream has been translated to the great hospital which, like Milton's eagle, now "mews his mighty youth"

1 *Bull Johns Hopk Hosp* 1939, 65 3

BILATERAL PLEURAL EFFUSION

AT any stage of tuberculosis bilateral pleural effusion may occur, but setting aside tuberculous polyserositis and winter influenzal outbreaks in tuberculous persons the condition has not often been described As a complication of chronic pulmonary tuberculosis it is rare, because the pleural cavity becomes partially or wholly obliterated by adhesions from repeated attacks of dry pleurisy Many years ago Wilson Fox noted that 4 per cent of his cases of phthisis had bilateral pleurisy Wilson[2] has recently reported ten instances of bilateral pleural effusion accompanying pulmonary tuberculosis in a series of 1552 persons admitted to the Gaylord Farm Sanatorium, Connecticut, during a ten year period 1928–38 In seven there was definite involvement of both lungs beneath, three having pericardial involvement, one a peritoneal effusion also, and another concomitant bone and joint tuberculosis A coincident effusion into the pericardial sac is not surprising and merely

2 Wilson G C *Amer J Roentgen* 1939, 39 745

indicates that death is not far off. Wilson also noted in his series four instances of bilateral effusion without involvement of the lung parenchyma, one accompanying a tuberculous knee-joint, another a tuberculous kidney, a third iritis and a fourth acute arthritis of fingers and toes, though the tuberculous ætiology of the last two cases was considered doubtful. It is remarkable that so few examples have been recorded as complications of artificial pneumothorax treatment. Wilson states that Forlanini never met with one among the hundreds of patients that he treated, that Saugman had none, and that Braun and Spengler failed to find any records in the literature. The modern practice of producing a bilateral partial collapse may possibly lead to this embarrassing complication.

Bilateral pleural effusion appearing like a bolt from the blue in a previously healthy person is of course another story and fortunately a very exceptional one. In the present issue we publish a record of such a case by G. Hurrell and E. F. Dawson-Walker, in which death followed from terminal miliary tuberculosis, the pleuræ showing at autopsy the oldest lesions. Here the pleural effusion occurred early No Ghon focus is recorded, unless a caseous nodule noted in the right interlobar septum be regarded as one; but the so-called primary foci, often multiple, are common in the subpleural region, and those pleural effusions which usher in a tuberculous illness probably result therefrom. The word allergy is misused and overworked. Employing it in a broad sense to include exudative lesions of serous membranes in all post-primary stages, there may be an early phase soon after the formation of the primary focus and an intermediate one complicating a later lesion, besides those direct extensions to the pleura in the final stages of the disease Bacteriological and immunological characters of the fluid often differ in these three phases

SUPPLY OF MIDWIVES

THE annual report of the Royal College of Obstetricians and Gynæcologists contains a memorandum by Mr. Arnold Walker on the staffing of maternity institutions This was drawn up at the request of the college owing to the difficulties experienced by voluntary maternity hospitals in obtaining an adequate supply of midwives and pupils The memorandum points out that there is no shortage of midwives in the country—the number on the roll is far in excess of requirements—and any difficulties experienced in obtaining applicants for vacant posts can only be due to the greater attractions that other forms of employment offer to the state-registered nurse who is also a midwife. Mr Walker compares the prospects, responsibilities, and social and recreational amenities enjoyed by a nurse who takes up a career in midwifery with those of one who remains a general nurse, or becomes a health visitor, and shows clearly why there is no rush to join the midwifery profession

With regard to pupil midwives, the factors to which he ascribes the shortage in voluntary hospitals in particular are, first, the increase in the number of cases admitted to municipal maternity beds from 60,000 to 123,000 in seven years, secondly, the new training rules of the Central Midwives Board; and thirdly, the introduction of the 48-hour week for nurses. The increase in the number of municipal beds has naturally resulted in a corresponding increase in the number of pupils trained in municipal hospitals. But this has not been accompanied by any falling off in the number trained in voluntary hospitals, the number of pupils trained each year has steadily risen in both groups of hospitals roughly in accordance with the work done. Under the new rules which came into force last summer the length of training of a midwife was doubled, and it was only to be expected that a large number of pupils would come forward to complete their training before that date. Roughly half a normal year's supply of pupils was used up in this way. The slump in entrants that followed was less serious than many had anticipated, and, as every pupil now spends longer in the wards than before, the units of labour represented by the pupils entering the schools had almost reached the 1936 level by May of this year. Their distribution, however, between municipal and voluntary schools shows a definite trend towards the municipal. London voluntary hospitals in particular have done badly. The explanation is undoubtedly financial, and if voluntary institutions are to obtain the pupils they require they will have to offer terms comparable with those offered by municipal institutions The training is now divided into two periods taken at different schools The first period is taken entirely in the larger hospitals and roughly corresponds to the old training The second may be described as an apprenticeship and entails at least three months on the district. Though in order to register as a midwife both parts must be taken, the first is all that should be regarded as necessary for the higher nursing posts which do not involve the regular practice of midwifery If this is generally realised the new rules should not place any additional burden on the majority of students and should have but little effect on the staffing of institutions Mr. Walker points out that the Midwives Act, 1936, can have had no adverse effect on the supply of pupils It has done much to improve the conditions of the midwifery profession and should be the means of attracting pupils rather than the reverse

Mr. Walker concludes that although the immediate shortage of pupils is temporary, there is likely to be a more permanent shortage on account of the great increase in institutional confinements which demand a corresponding increase in nursing staffs To meet this shortage, which includes both trained midwives and pupils, the conditions of service for both must be made more attractive. The suggestion that maternity nursing should form part of the training of every general nurse is, he thinks, subject to grave objections when considered in detail.

YELLOW FEVER BY MOUTH

UP to the present time the only insect vectors of yellow fever which have been found naturally infected are *Aedes ægypti* in Africa and South America and *A. leucocelænus* and *Hæmagogus capricorni* in South America The mosquito can apparently only be infected by sucking blood from an infected man or monkey during the comparatively short period that the virus is circulating in the peripheral blood-stream. This fact, combined with the short life of the mosquito, makes it very difficult to account for the persistence of yellow fever in certain rural areas during dry seasons, when mosquitoes are either absent or present only in small numbers. It has therefore been suggested that other insect vectors of yellow fever may exist which either live longer than mosquitoes or transmit the virus hereditarily. Recently Findlay and MacCallum [1] have shown for the first time that it is possible to infect both the Indian

1 Findlay, G. M., and MacCallum, F. O., *J. Path. Bact.* 1939, 49, 53

rhesus monkey (*Macaca mulatta*) and the African guenon (*Cercopithecus æthiops*) by putting yellow-fever virus into the gastro intestinal tract through a stomach tube They have also found that virulent pantropic yellow fever virus can survive for at least 15 days in the cockroach, *Blatella germanica* Taking these two findings together, non biting arthropods must be considered as possible vectors of yellow fever, especially as many species of monkeys are known to eat grubs and insects in addition to their mainly vegetarian diet

Since the first isolation of the yellow fever virus, continually improved methods for the immunisation of human beings against the disease have been evolved The inoculation of dead virus, even in large quantities, has been found to be quite ineffective either in protecting experimental animals from the disease or producing immune bodies in the blood of humans The aim has therefore been to secure a strain of living virus sufficiently attenuated to give satisfactory immunity without producing marked reactions Such an attenuation was found to occur after many passages through tissue culture with minced chicken embryo, first carried out by Lloyd, Theiler and Ricci[2] At first it was thought necessary to give large amounts of immune serum at the same time as the virus This was highly unsatisfactory, both because of the discomfort to the patient and the difficulties of obtaining large quantities of human immune serum For over two years now the virus has been given subcutaneously without immune serum both in America and London with good results and little after effect However, the finding of Findlay and MacCallum that monkeys can be immunised by oral administration of their vaccine virus opens up the possibility of human immunisation by this route This would greatly facilitate the administration of the vaccine especially under jungle conditions So far attempts at human oral immunisation have failed, probably because the virus is destroyed by hydrochloric acid

MARGARET SANGER

FEW of us are so lacking in the spirit of adventure that we cannot enjoy reading about the work of pioneers Margaret Sanger, pioneer of birth control in the United States, was born to poverty and membership of a long family From an artistic and erratic father, a friend of Robert Ingersoll, she early imbibed a political philosophy essentially radical in outlook. Later, under hard and primitive conditions, she trained as a nurse This experience, coupled with her early upbringing and subsequent work in the slums of New York provided an ideal culture medium for the growth of feministic and other "advanced" ideas Convinced that family limitation was an urgent and necessary step in the progress of human welfare, she set to work, in defiance of the law, to spread information about birth control among working class mothers Such conduct naturally brought her to grips with the Federal Government, and, to avoid trial and imprisonment, she fled first to Canada and later to Europe where she continued her work In England especially she received much sympathy and encouragement from many distinguished persons among them Havelock Ellis, H G Wells and Lord Dawson of Penn So dominated was she by the importance of her task that she became estranged from her husband—who incidentally suffered imprisonment for forwarding one of her pamphlets through the post—and was obliged to remain separated from her three children to whom she was devoted After visiting China, India and Japan, she returned at length to the United States where she stood trial and was put in gaol rather than abandon the cause she had at heart These are a few of the facts revealed in an autobiography[1] written with skill, modesty, humour and simplicity It is the story of a long and ultimately successful fight for an idea, waged with quiet persistence by a physically frail woman who hated the limelight

---

On Aug 11 Prof G GREY TURNER of the British *Postgraduate Medical School, is sailing for South America* on behalf of the British Council, which endeavours to promote professional contacts with foreign countries He will visit Buenos Aires Rosario, Córdoba, Montevideo and Chile, and will *return in October via Canada and the United States*

At a meeting of the council of the Royal College of Surgeons of England held on July 31 it was decided to apply for a supplemental charter to give the college power to grant a higher dental diploma entitled "master surgeon dentist" The college will also ask for power to elect annually to the fellowship not more than four members of the college of 20 years' standing

The death is announced of Prof RICARDO JORGE, professor of zoology and anthropology in the University of Lisbon, and formerly president of the public health council of Portugal For many years he was Portugal's delegate to the Office *International* d'Hygiène publique and he was recognised as an authority on smallpox and postvaccinal encephalitis

THE LANCET 100 YEARS AGO

August 3, 1839, *p* 693

From the evidence of Sir Astley Cooper before a parliamentary committee on medical education

"If I had a son to educate to the profession I should give him a preliminary education, which should continue to 18 years Besides what boys are generally taught, that preliminary education should comprehend Latin sufficient for medical purposes enough Greek for him clearly to understand the derivation of the terms employed in science (as it facilitates exceedingly the acquirement of medical knowledge), and mathematics to a certain extent, to teach him how to reason Having thus educated him in a preliminary way, I should put him for seven years to some hospital * * * Whilst he was engaged as a pupil I should be disposed to send him for a season to Edinburgh principally with a view to his following a course of clinical teaching * * * After having passed a season at Edinburgh, I should spend I am disposed to think, the seventh or last year of his education abroad, and that would bring him to the age of 25 . . ."

SPECIAL ARTICLES

BRITISH MEDICAL ASSOCIATION

MEETING IN ABERDEEN

(*Continued from p. 274*)

THE association's plan for a general medical service for the nation brings into health insurance not only the dependants of those now insured but also everyone of similar economic standing and everyone now attended under public assistance. Some of the Scottish divisions are not sure that contributory insurance is the best means of providing medical care for so large a proportion of the population.

Capitation Fees or Salaried Service?

At the representative meeting Dr. MARGARET MARTIN, for Edinburgh, suggested that it might be better if the work were paid for directly by the Government. She objected to the present contributory insurance, with its per-capita payment, because it does not cover the family as a unit, because it mixes financial and medical benefit, because it offers no advantage to the doctor of special ability or long experience, and because it makes no provision for pensions or superannuation allowances for practitioners. The insurance principle, she said, is suited to a limited class and a limited risk, but it becomes less and less applicable as the risk covered grows greater The only alternative to capitation-fee payment that had so far been proposed was a whole-time salaried service; but part-time salaried work might prove a solution, compatible with the ideals of the profession and meeting the needs of the public In the Highlands and Islands Medical Service Scotland could show good results from partly salaried practice. Having worked both for salaries and for capitation fees she had found no difference as regards her independence; indeed in insurance practice she had been much hampered. A salaried service, preserving free choice of doctor, could vary remuneration according to ability and experience and could offer pensions. Its management, Edinburgh thought, should be based on hospital regions, and should be in the hands of specially constituted health committees rather than committees of the local authorities

Dr E. R C. WALKER, for Aberdeen, pointed out that a great many intelligent people, both lay and medical, are interested in plans for a more comprehensive medical service. Opinions differed among doctors as among laymen, and it would be unfortunate if the B.M.A. were to take a hard-and-fast line. He sometimes found it awkward to defend the association's policy, because the arguments in favour of its decision to advocate extension of insurance with per-capita payment had never been set out at length The type of administration recommended was held by some to be unworkable, and there was a large body of opinion in favour of alternatives. The association would suffer in reputation if at this stage it got into a position from which it refused to move.

The Chairman (Dr. H G. DAIN) said that the finance of the general medical service scheme is already being considered by a committee, and to give them fresh instructions might be inadvisable Dr. A. H MACKLIN, on the other hand, believed the association should encourage constructive critics to work out their ideas more fully. Dr. W. J. S CAMERON found it significant that the views put forward last year by Glasgow should now be supported by representatives of Edinburgh, Aberdeen, and Dundee—the other three big cities of the north. His explanation was that Scotland has learnt from its opening skirmish over the national maternity scheme. There was a feeling that the plans for a general medical service sacrifice too much to "the general-practitioner principle."

Sir HENRY BRACKENBURY remarked that though these plans, for historical reasons, do not recommend ad-hoc administrative bodies for England there was no reason why different arrangements should not be devised in Scotland. As for finance, it was no business of doctors to decide how the state should raise the money paid them, but only how it should distribute that money. For twelve years the association had consistently opposed the grading of the profession into a civil service paid by salary; for such a change would alter the character of the service given. Why should the council be asked to inquire into the merits of a policy that was the direct opposite of the one the association had adopted? Dr WALKER replied that if the council is convinced of its rightness it should not object to giving a reasoned statement of its opinion. If the B M.A. were to entrench itself in one position, heaven help it. This was no time for dogmatic ex-cathedra statements, and it was vitally important that the association should run no risk of a split.

The meeting agreed with Dr. Walker that the council should be asked to consider and report on the following modifications:—

1. Remuneration of medical personnel by graded and adjusted salary with pension
2. Organisation of the medical service on a regional basis, centred on base hospitals, as designated in the B M.A. medical policy.
3. Ad-hoc administration corresponding to the regional organisation;

and to remit to the Scottish committee to report similarly on the application of such modifications in Scotland

Attempted Suicide and the Law

Dr. J. A. PRIDHAM, for Dorset, contrasted the sympathetic attitude of the law towards successful suicide with its behaviour towards people who tried to kill themselves but failed. To attempt suicide was a misdemeanour; the police waited at the recovering patient's bedside to take a statement, and he might be brought before the magistrates and punished. Recently the chairman of the bench at Weymouth had publicly protested when confronted with a post-encephalitic who had several times attempted suicide On being told of this case the Home Secretary had expressed full sympathy with the magistrate's view, and agreed that suicide as a rule calls for protection and sympathy rather than punishment. He had asked his correspondent for suggestions for alteration in the law, and Dr. Pridham believed the time opportune for the council of the B.M A to put forward such suggestions. If something could be done the B.M A. would reap the gratitude of the public

Dr. R G GORDON (chairman of the mental-health committee) said that such an inquiry need not necessarily take much time, for the National Council for Mental Hygiene had already collected much information Sir KAYE LE FLEMING (chairman of council) also accepted the proposition, but did not view it lightly, since the principle concerned is applicable to other grades of offence. "We are coming rapidly to agreement," he said, "that in a

large section of wrong doing from suicide even to the difficult boy at school, we are dealing with a mental imbalance of some kind where medical help is most likely to be of practical service" Suicide was near one end of a very long scale

The council was asked to report on the advisability of altering the law

Psychotherapy by Laymen

Dr GORDON reviewed the pros and cons of recognising mental treatment by trained laymen A very large number of people, he said, would benefit from psychotherapy, and comparatively few medical men and women were able to give it Many of the patients at present untreated could be helped by the trained layman working under the supervision of the doctor The clergy were often peculiarly fitted for such work, and applications for guidance had come from the churches—especially the Anglicans and the Free Churches, for the Roman Catholics and Church of Scotland, though they thought their clergy should be instructed in psychology, did not want them to set up as psychotherapists So many non doctors were now in psychological practice that it might be well to secure some control of the stream before it became a flood One objection to any such recognition of lay psychotherapists was that their work is essentially the same as the medical psychotherapists' (Whereas chiropodists do what doctors don't) It was said they might multiply and squeeze the profession out of this part of practice, but their training could be made stiff, and no general admission was contemplated A second argument was that to authorise such work by layman would lower the status of psychological medicine at the very moment when its importance as "the other half of medicine" is being realised It was also said that as the experts have not agreed about the training of medical psychotherapists, they will never agree about the training of lay ones Here again the answer was that there is no need to make the course of instruction easy, it might last two years, or it might last more, indeed it might be made so difficult that entrants would prefer to qualify as doctors Having considered these facts the mental health committee asked the representative body to approve the following principles —

(i) No lay psychotherapist should undertake treatment unless (a) the patient has been recommended to him by a registered medical practitioner, or has had his case investigated by such a practitioner at the request of the lay psychotherapist, and (b) the lay psychotherapist has undergone a prescribed and approved course of training

(ii) No medical practitioner should recommend a patient to a lay psychotherapist unless (a) the medical practitioner is himself a specialist in psychological medicine or has referred the case to such a specialist and (b) the medical practitioner has satisfied himself that the lay psychotherapist has undergone a prescribed and approved course of training

(iii) Where treatment is undertaken by a medical practitioner and a lay psychotherapist in coöperation, the responsibility for the case should lie with the medical practitioner and there should be consultation from time to time between the medical practitioner and the lay psychotherapist

It further asked the representative body to express the opinion that "lay psychotherapists should undergo a special training of at least two years' duration on the basis of a curriculum to be agreed upon by the responsible bodies, and that the association take the initiative in putting machinery in motion for the establishment of approved courses of training"

Dr MONA MACNAUGHTON, for Newcastle on Tyne proposed that no action should be taken till a further report was received The principles were too important for rapid decision, and meant another restriction on the work of general practitioners Dr A A EAGGER, supporting, disliked the wider opening of the door to lay competition If there was a shortage of medical psychotherapists the B M A should concentrate on means of inducing more students and doctors to take up this work—e g, by courses at universities and by increasing salaries The aim should be to raise its status, whereas the present proposals would lower it He added that patients with mental disorder almost always have physical disorders demanding attention Sir HENRY BRACKENBURY commended the proposed rules, not as a statement of principles but as a guide to conduct They had been endorsed by the psychological-medicine group, and others outside The association was being asked to say where it stood, and the question was becoming urgent After Dr GORDON had spoken of the risk that other bodies would take action if the B M A did not do so, the meeting expressed its disapproval of more postponement

Marylebone, through Mr A M A MOORE, then tried to amend the proposed principles by omitting the proviso in section (ii) that no practitioner should recommend a patient to a lay psychotherapist unless he is himself a specialist in psychological medicine or has referred the patient to a doctor who is Mr Moore did not want to see the general practitioner's hands tied; but Dr RICHARD EAGER did not want to see the medical psychologist surrender one of his few perquisites Sir HENRY BRACKENBURY was convinced that the primary place of medical psychologists must be preserved, and that it is not within the competence of the general practitioner to select cases suitable for lay psychotherapy Dr GORDON, while subscribing to the general principle that the registered practitioner is competent to do any kind of medical work, regarded this as an exception The practitioner was not to blame for the inadequacy of teaching in psychological medicine when he was a student some years ago, nor for the general lack of opportunities later But in fact he had seldom had a chance to fit himself for the very difficult task of deciding which patients (if any) are suitable for lay psychotherapy —Marylebone's amendment was lost

Dr JOSEPH NUNAN was worried by the process of sanctification of various kinds of lay practice that began some years ago with the registration of medical auxiliaries and continued with the recognition of chiropodists These latest proposals suggested a loss of self confidence in the profession and a readiness to admit incompetence and failure Dr FRANK GRAY said that if doctors as a whole have not yet had adequate training in psychological medicine, was this a reason why other people should be given it? Dr HARRY STALKER pointed out that the mental conflicts of a normal person are not readily distinguishable from early symptoms of disease The lay psychotherapist must necessarily run counter to modern thought because he must dissociate mind from body The pastoral psychotherapist with his religious background could not approach his patient in an altogether unemotional and "biological" way, and might cause distress Mr MOORE said that the medical section of the British Psychological Society strongly condemned the proposals Dr H S HOWIE WOOD referred to the need for a very high standard of professional integrity in all who undertake psychotherapy, and Mr L R BROSTER thought that as endocrine disorder is a common cause of emotional change a training in endocrinology as well as psychology would be required by the lay psychotherapist

He agreed that much nervous illness goes untreated, but he thought laymen should facilitate medical treatment instead of undertaking treatment themselves

Dr. GORDON, concluding the case for the mental-health committee's proposals, said that, before voting, the representatives should ask themselves three questions: (1) Are we doing our duty to the public at large if we confine the treatment of neurotic people to the small number of medical psychotherapists available now or in the next year or two? (2) Are there a number of these people whose disability largely turns on spiritual problems which they have to refer to their spiritual pastors; and, if so, ought these pastors to have some sort of medical training? (3) Is it desirable that the large body of lay psychologists already existing in this country should go forward without any medical control?

The meeting however had already made up its mind not to countenance lay psychotherapy on the terms proposed, and it rejected the draft principles by 102 votes to 75.

Subsistence Allowances for Representatives

Those who represent the divisions and branches at the annual meeting of the association go at their own expense. On Swansea moving that they should be paid a subsistence allowance, Dr. J. C. ARTHUR said he calculated that attendance cost him 7*s* 6*d*. an hour, and since he was paying as much for his seat as for a theatre stall he would certainly not be prepared to apologise to the chairman if reproved for temporary absence. Dr. GEORGE LAURENCE spoke of the need for attendance by younger men and the greater choice of representatives that would be possible if some of the expenses were covered. Dr. GRAY defined "younger" in this connexion as "under 50"; this was the time of life at which men were usually meeting their heaviest expenses in the education of their children; and incidentally attendance at a meeting at the end of July usually prevented a holiday with the children. Dr. W. N LEAK also supported the proposal, but another speaker thought the riper wisdom was found in the later age-groups. Dr. S. NOY SCOTT asked where the association would stop. Would it offer salaries to the council? And pensions? He feared a descent to the level of the House of Commons Dr. DOROTHY MASON said that St Pancras would be glad if representatives were paid, but hoped the annual subscription would not be raised —The motion was lost

Publicity

Dr H. G. DAIN, as chairman of the propaganda committee, reported that despite difficulties much is being done to improve relations between the public as a whole and the profession as a whole. The committee was trying to get a better atmosphere "not for the association but for doctors" Dr. T. A. MORRISON criticised the spending of money on a conference on nutrition and on publicity for safe milk; this was work for the Ministry of Health and not for the B M A Dr. A. W. GARDNER was also dissatisfied, but Mr. ZACHARY COPE thought the prestige of the association was rapidly rising Dr. S W. SWINDELLS spoke of the value of the nutrition conference, which cost the association £200 He kept an advertisement of the B.M A cookery-book in his consulting-room and had sold about 150 copies; his patients said "it is good of you doctors to take an interest in things like this for us." Dr H. S. HOWIE WOOD had noted the failure of some of the older practitioners to distinguish between advertisement on behalf of the profession and advertisement by individuals. To issue information about the safety of milk or the stocking of emergency larders was useful because the public knew that here the doctor had no axe to grind. Dr. A. S. WILSON suggested that money might well be spent in developing an inexpensive method of pasteurising milk efficiently and in showing the farmers how this could be done; many farmers and milk distributors were antagonised by the propaganda of the association. Dr. DAIN pointed out that if the B.M A. said that unsafe milk should not be sold the people who produce and distribute it must inevitably be annoyed Dr. T. H. C. DURHAM urged that doctors should become members of their local corporations and insurance committees, for they could thus influence people who knew and trusted them and believed what they said. Dame LOUISE MCILROY said that governments would listen to voters when they would not listen to the medical profession, and the propaganda committee should try to interest the general public in prevention

Proprietary Medicines

A joint conference of representatives of the B M A. and the Pharmaceutical Society has been studying the possibility of making an approved list of proprietary medicines, but the council has reluctantly decided not to go forward with this at present This decision was criticised by Bournemouth, which considers action overdue, in view of "the constantly augmented flood of circulars now delivered daily by post" Dr. WALTER ASTEN said that unfortunately both practitioners and consultants were unduly suggestible, and an authoritative list was badly needed Sir KAYE LE FLEMING replied that the lowest estimate of the cost of a limited scheme was £2000 a year, and the Pharmaceutical Society, being (like the association) committed to large expenditure on new buildings, could not contribute a penny Dr N C. SIMPSON proposed, but did not press, an amendment from West Suffolk suggesting a limited investigation of hormones, vitamins and barbiturates; he thought the B.M A. would much better spend money on a useful object like this than on propaganda Sir EWEN MACLEAN (chairman of the science committee) said that the work of the council of pharmacy and chemistry of the American Medical Association, despite the gratuitous service of experts, cost £10,000 to £14,000 a year; and the American public was still ridden by proprietary medicines It would not be wise to finance inquiries out of payments by drug manufacturers, and the council felt that nothing more can at present be done —The representative body regretfully concurred

Radiographers: Radiological Reports

Two resolutions affecting radiologists were adopted. The first declares that, while there is no objection to doctors employing non-medical radiographers to take films, the responsibility for interpreting such films must rest with a radiologist or other qualified medical practitioner The second, which concerns reports required by insurance companies, or for other purposes connected with litigation, runs as follows:—

1. A radiograph taken in hospital is part of the hospital record of the case and is the property of the hospital It should not be used for any other purpose without the consent of the hospital, the patient, and the radiologist.

2 Radiological reports are intended for use in the treatment of the patient and should not be communicated to a third party without the consent of the patient The rules of the hospital should show clearly which officer is charged with the duty of making reports on hospital

cases to outside bodies or persons and the responsible officer should, in every case in which a radiological report is involved, consult and secure the assent of the radiologist before making his report

3 The person or body requesting the radiological report should pay an adequate fee to the radiologist

4 Re-examination for medicolegal purposes should be conducted by a radiologist in his private capacity

In introducing these principles Prof A H BURGESS (chairman of the special practice committee) said that senior resident officers, or members of the staff of hospitals, often use—as the basis or most important part of their reports—*the findings of a radiologist* The latter complains that he is seldom even consulted, far less paid a fee

Local and National Health Insurance

Many divisions submitted resolutions urging development and extension of the public medical services established by the profession These resolutions commended the services as a means of maintaining the position of the general practitioner, of implementing the association's policy, and of preparing the ground for the projected general medical service One speaker felt that the council, in its advocacy of the larger scheme, has lost its enthusiasm for the local public medical services, yet these were the salvation of the practitioner and their failure would be interpreted by the Ministry of Health as evidence that the public no longer wants the private doctor, preferring clinics Dr J W BONE (chairman of the general practice committee) maintained that, on the contrary, the council has fostered these services in every possible way, and Sir KAYE LE FLEMING was astonished that anyone could doubt it

As chairman of the insurance acts committee Dr E A GREGG accepted a motion from Leeds demanding further consideration for the provision of consultant and laboratory services to insured persons

Dr G DE SWIET, for Kensington wanted the representative body to express misgivings about friendly societies His motion referred to inequitable distribution of benefits by the societies, their cumbersomeness, and their tendency to hoard money, and he thought their multiple administration expensive and their selection of members incompatible with a truly comprehensive scheme Dr DAIN, however, said that the association has no control over friendly societies, and the meeting was not at the moment disposed to discuss Dr de Swiet's strictures on the present arrangements

Dr C W SOMERVILLE for the Lothians, suggested that a conference of Scottish panel committees and divisions should be held each year He spoke of the remoteness of London and the apathy or antipathy that it engenders among many Scottish practitioners Dr E K MACKENZIE supported him with passion, and, though Dr J B MILLER thought that more representation would increase the difficulty of discovering the wishes of those represented, the suggestion was referred to the council

Short or Long Postgraduate Courses?

The postgraduate instruction of panel practitioners was debated on a motion by Tunbridge Wells recommending extended courses of study at local hospitals as a supplement to intensive courses at central schools. The plan approved in Kent, said Dr A M POLLOCK is to hold several courses a year, each consisting of twelve weekly sessions of three hours, divided into one hour periods in which demonstrations-talks are given with opportunity for discussion In Kent there were 800 insurance doctors of whom only 49 last year found time to go to the intensive courses, and some who went felt that so much was crowded into the fortnight that in six months all was forgotten The local course had the merit of promoting contact between practitioner and specialist, it obliged the teacher to brush up his knowledge before addressing a critical audience of colleagues in general practice, and it was cheaper since no locums or railway tickets or subsistence allowances or lecturers' fees were required

Dr J E STACEY said that for many years such a course has been held in Sheffield every six months, it lasts eight weeks with two 1½ hour sessions twice a week Comparing the results with those of the intensive courses lately started he thought the practitioner gets more benefit from the latter The eight weeks' course beginning with 50 attenders was apt to end with 7 or 8, whereas people felt it incumbent on them to attend throughout the fortnight of an intensive course In a fortnight the practitioner could renovate his knowledge of all branches of medicine, whereas a long course was apt to turn him into a consultoid

Dr GREGG said that the British Postgraduate Medical School has arranged an extended course for London practitioners, and next year four more would be undertaken in the provinces He was sure the Ministry of Health would listen to suggestions

Fees and Rates of Pay

The vexed question of the fee payable to the anæsthetist at a dental operation on an insured person has been before the general practice committee and Dr BONE put forward a tariff that may be summarised as follows —

Where the practitioner provides the gas and apparatus — For administration of nitrous oxide or a similar anæsthetic, ceasing when the operation begins, 10*s* 6*d* for one patient or 7*s* 6*d* per patient if more than one is treated "For other administrations, whatever the anæsthetic, the fee should be one guinea"

Where the dentist provides the gas and apparatus — Extraction of 1–8 teeth, 10*s* 6*d* (or 7*s* 6*d* if more than one patient is treated), 9–12 teeth, 12*s* 6*d*, 13–16 teeth 17*s* 6*d*, 17 or more teeth, £1 1*s*

Dr A S WIGFIELD disliked variation of the fee according to the number of teeth removed, the doctor should be paid for administration of an anæsthetic and not on piece work —But the meeting accepted the tariff

A motion also was passed saying that a minimum fee of a guinea should be payable for an hour's teaching in nursing and hygiene for ambulance lectures, and for first aid lectures to A R P workers Mr G P LANGLEY wanted to excuse officers of the St John Ambulance Association and similar bodies from demanding a fee from their own organisations but Dr H C PELLY SMITH thought they could return it and Dr BONE said there was no obligation to accept it

As regards the remuneration of medical men and women engaged in whole time teaching or laboratory work the council was authorised, for the time being, to give effect to the following scale —

Grade III (junior workers employed on a temporary basis (*a*) workers employed in teaching or research institutions, with opportunities for study for the higher degrees or for research in a well-equipped laboratory; (*b*) workers not provided with such opportunities) —The minimum salary for grade III (*a*) shall be £250 per annum for a practitioner without experience and £300 per annum for a practitioner who has held a resident hospital appointment The minimum salary for grade III (*b*) shall be

£350 No person shall be employed in grade III for a total period of more than three years. These salaries shall not apply to appointments limited to a term not exceeding one year and not renewable.

Grade II (workers who have had three years' experience in grade III or in work of an equivalent character)—The minimum commencing salary shall be £450, rising by annual increments of £25 to £700. Previous service in this grade shall be reckoned in calculating the appropriate salary of a worker transferred to another university or institution to fill a similar post in the same grade.

Grade I (workers whose qualifications, duties and responsibilities justify a position of seniority in status and a higher remuneration, such as the reader or senior lecturer or senior assistant or non-professorial head of a department)—The minimum commencing salary shall be £750 and suitable increments shall be given for capability and length of service.

ANNUAL MEETING

At the formal annual meeting on July 25 Dr Thomas Fraser, C.B.E., D.S.O., D.L., of Aberdeen, was invested with the president's badge by his predecessor, Dr Colin Lindsay of Plymouth, and Sir Beckwith Whitehouse, president-elect, said a few words about Birmingham preparations for next year. At the resumed annual meeting held the same evening delegates from the Canadian Medical Association (Dr. F. G Pedley) and the American Medical Association (Dr. Roger I. Lee) were introduced, together with foreign guests (Prof Einar Meulengracht of Copenhagen, Dr. W. McK. Craig of Rochester, Minn., and Dr. Chevalier L. Jackson of Philadelphia) and representatives and delegates from the Empire overseas. The gold medal of the association was presented to Dr C. O Hawthorne (chairman of the representative body from 1928 to 1931), the Sir Charles Hastings clinical prize to Dr. Helen Jardine of Leyton, and the Middlemore prize to Mr. L. P. Jameson Evans The President delivered his annual address (published in our last issue) and Dr. Dain moved a cordial vote of thanks

Earlier in the day the University of Aberdeen had conferred the honorary degree of LL.D. on Dr. Fraser, Dr. Dain, Professor Meulengracht, and Sir James Elliott, F.R.A.C.S.

THE ANNUAL DINNER

An immense company sat down to dinner on July 27 in the municipal café near the beach, but in due time rose again to greet the Haggis, which was preceded by a piper but served, alas, as a very small savoury. The speeches began with the toast of Town and Gown by Dr HAWTHORNE, with responses from the Lord Provost (Mr. Thomas Mitchell) and the Chancellor of the University (Lord Meston), after which the local alumni surprised their guests by singing a verse of Horace's *Integer Vitæ* Mr. FREDERICK MARTIN was frank but friendly in proposing The British Medical Association, coupled with the name of Mr. H. S. Souttar, the new chairman of council, whom he claimed as the son of an Aberdonian. Mr. SOUTTAR, in his reply, produced evidence that the Government and the profession have confidence in the B.M.A. As for Mr. Martin's personal praises he recalled the reply of the spinster on the announcement of her marriage: "the rumour was untrue but she was grateful for the rumour." Prof J. R. LEARMONTH, speaking of The Guests, was glad that year after year overseas delegates come to the association's meetings, subordinating sometimes race, sometimes creed, and sometimes even political opinions, because above all they wished to serve the cause of health throughout the world. Mr. R G. BOOTHBY had asked a fellow M.P. what he should say; and received the reply "That depends on whether you want an anæsthetic in childbirth." Sir JAMES ELLIOTT wished that those who hold the citadel of the Empire would get to know more of those who hold the outposts Finally Dr. H. EDGAR SMITH, in a speech of graceful and grateful appreciation, proposed The President. Emphasising his urbanity (remarkable in a rustic born outside the 12-mile limit of Aberdeen) and his lack of insularity (despite his preoccupation with the islands of Langerhans before the war and the isles of Greece during it), he summed up by saying that no-one better conforms to the policy of the B.M.A. that the general practitioner should be the keystone of the arch between the layman and the specialist

At the end of the dinner Dr. FRASER gave the toast of Bon Accord (the Aberdeen motto): "Happy to meet; sorry to part; happy to meet again" During more than a week of gatherings—large and small, splendid and homely—Aberdeen expressed this hospitable spirit, and many members of the association must now add affection to the respect they previously had for Aberdonians. The charm of the city and countryside made it easy to understand, if not to share, the Lord Provost's ill-concealed belief that it is the best place on earth.

(*Reports of scientific sections appear on p. 315*)

APPOINTMENTS FOR HOSPITAL OUTPATIENTS

Mr. Alfred M. Lyons, a retired business man of Sydenham Hill, calculates that he has waited 300 hours on an outpatient bench in the past five years[1] Mr. Lyons's case is by no means peculiar. To the great loss of working time which ill health steals from the nation must be added no small amount lost waiting in the outpatient departments of the voluntary hospitals of England. Among the ancient "chronics" an afternoon in outpatients has become a social occasion. For the working man and woman, however, it has all too often meant the loss of a job

In the past, from time to time, efforts have been made to devise outpatient appointment systems, but few have survived to become an integral part of hospital life. For these falls by the wayside numerous causes have been given. Doctors are said to take no notice of them in sending their patients up to hospital. Patients are said to prefer to travel at lunch-time when cheap tram and bus fares can be got. It has even been argued that the chronic refuses to forgo her waiting. On at least one occasion a carefully thought-out system has been blackballed by medical conservatism. For the past five years however the Manchester Jewish Hospital has been working an extremely successful system of outpatient appointments About 80,000 appointments are now made each year and general practitioners are encouraged to make first appointments for their patients over the telephone. Not more than 1 or 2 per cent. of patients fail to keep their appointments without letting the hospital know. The system is greatly appreciated by patients, employers, and even the honoraries, many of whom frequently ring up the hospital to find out how long their outpatients are likely to last, so that private work can be arranged accordingly. The system has enabled the hospital authorities to avoid an extensive reconstruction of the

1 *News Chronicle*, July 26

outpatient department as there are now seldom more than ten or fifteen patients waiting at one time

On July 18 University College Hospital introduced a similar system Before starting, careful investigations were made to find out how many patients each honorary sees on an average in half an hour It was found that surgeons averaged three and physicians two Bookings are accordingly made at half hour intervals for two or three patients At first the system was applied only to old patients, who at each attendance booked an appointment for their next visit It proved completely satisfactory and was therefore extended to new patients, and is now working for twenty one outpatient clinics in all Patients referred from casualty attend the appointments clerk and book a time to see the appropriate specialist New outpatients may themselves ring up or write to the hospital suggesting when they would like to be seen and their convenience is as far as possible studied In addition private doctors are invited to ring up Euston 5050 and ask for the appointments clerk at any time of the day or night, but preferably between 12 noon and 8 P M , and already increasing numbers of doctors are availing themselves of this convenience for their patients Waiting is not absolutely eliminated but is reduced from an average of three hours to under half an hour The appointments list for the day enables the records department to put out on the doctor's desk the notes of all the patients expected and if any fail to appear the presence of the notes provides an automatic means of follow up Patients who attend without an appointment are placed at the end of the appointments list. So far the system is giving complete satisfaction

Why has it taken so many years for this very obvious reform to reach fruition? The University College Hospital system will probably cost the authorities between £400 and £500 per annum in clerical fees, phone calls, stationery and postage Attempts to operate an appointments system without special officers in charge is, we feel, doomed to failure And in the past the unsatisfactory attempts which have been made to eliminate *outpatient waiting have* probably been wrecked by the attempts of hospital authorities to work the systems without spending money In these days of planned utilisation of the nation's man power, time saved for industry is national wealth Money, then spent on efficient hospital appointment systems is money well spent indeed Already at St Thomas's, as noted in our columns, an appointment system for old patients has been introduced In the new Westminster a complete outpatient appointment system will be in operation shortly , at St Mary's Hospital, Manchester, an appointments scheme has been in force since the beginning of the year

It is to be hoped that the other voluntary hospitals will follow these excellent examples The Emergency Bed Service has proved that the outside doctor is ready to cooperate with the hospitals for his acutely ill patients The experience of University College suggests that he will do the same for his less urgent but no less important diagnostic problems

---

" We may safely say that in the case of well over half of all the children educated in our elementary schools, their school life is something quite apart from their ordinary life bearing about as much relation to it as an ordinary business man's churchgoing bears to his " —Dr HARRY ROBERTS, *New Statesman*, July 29, 1939, p 172

WORLD CONFERENCE ON CRIPPLES

LONDON, JULY 16–22

Lord NUFFIELD and Mr PAUL KING, president of the International Society for Crippled Children, welcomed the delegates to this conference at the official opening on July 17, when Mr WALTER ELLIOT, Minister of Health, reviewed the rapid development of orthopædics in this country since the late war He said that existing legislation, together with voluntary and municipal organisations throughout the country, had brought the solution of the problem of the ordinary cripple well within sight But the industrial cripple presented more difficulty, and this was why an interdepartmental committee had been set up to inquire into the problem The committee urged that fractures, the most important group of industrial injuries, should receive specialised treatment, and that additional rehabilitation centres were also required

Mr R C ELMSLIE, opening a discussion on preventive orthopædics in childhood, traced the diminution in the incidence of gross deformity during the 39 years since he first attended the orthopædic department of St Bart's as a student Three classes of deformity stood out—those due to rickets, scoliosis, and tuberculosis of the spine With rickets it had been less the growth of our knowledge of the disease than the infant-welfare movement and an adequate milk-supply which had achieved success Physical education was responsible for the present comparative rarity of scoliosis , for this we were first indebted to the Scandinavians Although knowledge of the cause of tuberculosis failed to bring the much needed specific remedy, it stimulated Robert Philip to found tuberculosis dispensaries in 1887 and led to statutory provision for treatment of all forms of the disease. This had undoubtedly contributed to the steady reduction in crippling due to tuberculosis Finally, orthopædic services had enabled surgeons to treat crippling conditions before deformity has actually developed

Contributing to a discussion on the education, vocational training and subsequent employment of the crippled child, Mr CECIL MAUDSLAY (Board of Education) described the British system, and Dr PAUL GUILDAL spoke of his life long experience of work in Denmark. He said that what mattered was intelligent application of the system to the individual The risk of comprehensive legislation is that it may produce undue segregation of physically handicapped children, so making them outcasts from normal society Whenever possible the pre school cripple should be cared for at home so that family ties and affection may develop in the normal way Crippled school children should be day-scholars unless their disability was such that travelling became a major problem/ There should be *separation of mentally*-defective cripples from those of normal mentality Vocational training should be pushed during the school period, since the crippled child's school life is, on account of the treatment he must receive, always shorter than the normal period Resident institutions ought to be as home like as possible and the children should go home for their holidays In short, every effort should be made to give the cripple the outlook of the normal citizen

The case of the industrial cripple was discussed by Dr LICHARDT and Dr LAUTERBACH, who described the excellent system now prevailing in Germany and Mr MAURICE STACK, of the International Labour

Office at Geneva, reviewed existing legislation and methods in Europe and the Americas. The position seemed to be that no one country had a perfect system (the perfect system was probably indefinable at present), but enough was known, and had been worked out in practice, to enable any country to frame laws that would give the industrial cripple the benefits he undoubtedly deserved Progress depended less upon procedure than upon the spirit in which it was pursued. "The disabled of the industrial army," said Mr. Stack, "have a right to the same public concern as the war disabled. Industry cannot operate and produce its fruits if men are not willing to risk their lives and limbs in trades some of which are hardly less dangerous than battle itself."

NORWAY

(FROM OUR OWN CORRESPONDENT)

STERILISATION OF WOMEN

THE Norwegian sterilisation law reflects pretty accurately the ethical standards in vogue when it was framed. It permits sterilisation as a prophylactic of mental disease and of serious bodily disease in the prospective progeny, and when there are reasonable grounds for assuming that the woman will be unfit to care properly for her offspring The possible medical indications include neurasthenia, anæmia, pulmonary tuberculosis, heart disease, mental disease and much else, and such social indications as unemployment or drunkenness on the part of the husband are also included. A careful study has been undertaken by Dr. Bernhard Paus of the 68 women sterilised at the Sauda Hospital between 1926 and 1938 In only 11 were the indications strictly medical, 5 of these being obstetrical or gynæcological cases and the remaining 6 cases of pulmonary tuberculosis. A follow-up study showed that in 15 cases sexual activity was diminished while in 7 it was increased, the increase being attributed as a rule to freedom from the fear of a new pregnancy. Mental conflicts with religious scruples often followed the operation, and in two cases the husbands were assailed by penitent after-thoughts, based on "religion" or frustration, the wife's sexual activity having become much reduced. There were four women who reported that they had lost much of their capacity for and pleasure in work. A surprising number of the patients replied of their own accord that healthy folk ought not to undergo the operation

WEIL'S DISEASE

Until lately Weil's disease was looked on as a pathological curiosity in Norway, and only three cases have hitherto been published in which the diagnosis was confirmed by the demonstration of the leptospira But the disease which seemed rare yesterday because it was overlooked has become almost common today. In the Ullevaal municipal hospital of Oslo seven cases have been observed since 1936, the diagnosis being confirmed bacteriologically in five. As in other countries, the disease seems to be much more common in men than in women or children, doubtless because their employment exposes them to infection. Of the seven Ullevaal cases described by Dr O. Svaar-Seljesaeter in *Nordisk Medicin*, six were adult males In one case the disease followed the bite of a rat, and some of the other patients had worked in rat-infested buildings The highly polluted water of the Aker river, into which two of the patients had fallen, may well have been the source of the infection in them It seems that we shall continue to harbour this disease as long as we harbour rats

VERTEBRAL FRACTURES IN CONVULSION THERAPY

From Dr. Dedichen's private asylum—one of the few in Norway—come disquieting reports as to the frequency of fractures of the spine as a sequel to Cardiazol-shock treatment of various psychoses Dr Dedichen's first case was that of a patient who had been given cardiazol shock before his admission and who had suffered from such severe pain in the back that treatment had had to be discontinued. A radiological examination revealed three severe compression fractures This observation set Dr. Dedichen examining all his cardiazol-treated patients for similar lesions In a short time he had found as many as 6 such cases among 80 patients treated Now seriously perturbed, he sounded one of his colleagues attached to another hospital where convulsion treatment had been given to several hundred patients "Oh, yes," this doctor replied, "We have often had patients complaining of pain between the shoulders, but it is of no importance, and it is confined to the muscles." The tell-tale radiograms came as a disquieting shock. It is suggested that this accident can be prevented by never allowing the patient to double himself up during the treatment.

VACCINAL ENCEPHALITIS

Dr. P. M. Holst, who is in charge of Oslo's fever hospital, considers that the danger of vaccinal encephalitis has by no means passed, just because it enjoys less publicity in the press In 1936 there was no such case in Oslo, but in 1937 there was one case which proved fatal, and in 1938 there were two cases, one of which ended in death Between 1929 and 1933 there were eleven cases out of about 15,000 vaccinations in Oslo In 1935 there were two fatal cases after only 355 vaccinations

SCOTLAND

(FROM OUR OWN CORRESPONDENT)

DYNAMICS OF CROWD INFECTIONS

IN a Honyman Gillespie lecture in Edinburgh last week Dr. A. G. McKendrick said that random movement of human beings is a fundamental factor in epidemiology. Movements of individuals in a crowd may themselves be purposeful but the mass as a whole may be unpredictable. Most contacts in a crowd are random, but the behaviour of the whole human mass may depend on the same laws which govern the movements of the mass of molecules of a gas. The law of mass action seems to apply to human problems. The growth of organisms in broth is another example of mass action. The organisms increase in size by absorbing food, and divide by fission when they reach a certain size The rate of the "reaction" depends on the number of organisms and the amount of foodstuff This phenomenon is also seen in the spread of contagious disease and indeed in the spread of ideas.

The spread of disease through a community depends on many chance circumstances, including the random meetings of units of the community. In studying the course of epidemics it is possible to abstract the essentials, reduce them to diagram form and apply mathematical technique The number of new cases of disease is proportional to the number who are sick and the number who are susceptible The chances

of recovery and the chances of death are both proportional to the number of cases, though, of course, this excludes many important factors such as variations in susceptibility and crowding Each disease has a certain threshold density in the population necessary for the development of an epidemic If an epidemic is allowed to run its course in an isolated community, that is, one in which there are no births *and no immigration*, the curve of the number of susceptibles falls with the appearance of cases, crossing the threshold at the point at which the maximum number of cases occurs Thereafter the number of cases decreases, but the curve of the number of susceptibles also continues to fall, until it straightens out as far below the threshold level as it was above it before the epidemic started The epidemic exhausts itself long before all susceptibles are affected or the organism loses virulence When new members are added to a community by birth or immigration the course of an epidemic is different The curve of susceptibles fluctuates about the threshold level, falling below it when cases increase, this fall reduces the number of cases, then with the introduction of more susceptibles there is another increase in the number of cases The oscillations would theoretically go on indefinitely, but actually they gradually become smaller and die away as the epidemic ceases Each disease has its own threshold of susceptibility If the infectivity is low the threshold is high and vice versa The threshold of a community may be increased by cutting down the chances of infection by public health measures, but continuous rigorous control of this artificial resistance is necessary, for if it fails an epidemic may be rapidly precipitated

CAMPAIGN AGAINST RHEUMATISM

The idea of a national rheumatic service received a set-back when a deputation from the Scottish council of the textile trade unions was received by Mr John Colville, M P, secretary of state for Scotland The deputation urged that, in view of the suffering and economic loss caused by rheumatism, a nation wide system of rheumatic clinics should be established According to the reports of the Department of Health for Scotland, rheumatism was responsible for about one eighth of the total incapacitating sickness among the insured population Mr Colville, replying, said he was aware of the size of the problem Much was being done by voluntary and municipal hospitals and other agencies It was not possible to establish a national service at present, but he would consider what could be done to extend existing work

LANARKSHIRE HOSPITAL SCHEME

A scheme for a great general hospital and maternity and infectious diseases hospitals in Lanarkshire has been projected by the county council together with the town councils of Rutherglen, Coatbridge and Hamilton in collaboration with the commissioner for special areas in Scotland The original cost was estimated at about £900,000, but the figure has now been raised to £1,166,000 The commissioner was asked if he would provide an additional grant in view of the increased cost, but he suggested a cheaper modified scheme—namely, to increase his percentage grant, while retaining the maximum of £500,000, conditional on work being begun before March 31, 1940 The joint committee of the councils concerned now think that the *project may have to be abandoned or at* least greatly modified

GRAINS AND SCRUPLES

Under this heading appear week by week the unfettered thoughts of doctors in various occupations Each contributor is responsible for the section for a month, his name can be seen later in the half-yearly index

FROM DOCTOR DON

I

As usual I have taken too much on and the prospect of Grains and Scruples, the B M A meeting in Aberdeen, and several lectures, all to be completed before I sail to America on Aug 19, fills me with dismay The kind of thing that will slip easily off your pen, said Mrs Kettle, but things which do that turn me hot and cold when I read them in print The older I get the more I refuse, and yet the more life seems shaped by obligations and forces from without rather than by some inner plan or persistent purpose And so I keep grumbling, and thinking if only I can finish this and get out of that, I shall really be able to do my own work and have leisure to be happy Life at present has the negative virtue of not providing enough leisure to be unhappy, though I suppose according to Schopenhauer one can expect no more A few years ago a lady wrote a book that solved all these difficulties Just keep a diary of every one of your activities, note which left you happy and which didn't, and within a short time you would learn where your happiness lay I have toyed with the idea and it won't work A superficial study of the autonomic nervous system shows that the same stimulus at different times produces entirely different results and the intact organism is a great deal more unpredictable than the autonomic nervous system In most of us the emotions are rather like the weather, though some enjoy a more equable climate than others We know that with a south east wind it will rain long and with a north east it will be cold, but most days we cannot foretell when happiness will break in like sunshine I am so busy that I never lack something to do, and am always looking forward to time for relaxation and hobbies One is haunted by the fear that the day may be gone and the zest for the game departed before one gets out The beauty of transient things takes on a poignant quality, but at any rate one is spared preoccupation with the problem of leisure

* * *

What fun it would be to have a fugue—a Ramble in Aphasia as O Henry somewhat inaccurately entitled his short story on this theme Then I should know what life would have been like if I had gone into the insurance business at 17, though really I should prefer something even simpler than that say a tobacconist's shop One's wants seem small—good food, a comfortable bed, and time to sit in the sunshine or to feel the hill wind on one's face—and why should one work so hard to satisfy them? Would there have to be a Mrs Chaliee? The combination of a good landlady and a bedfellow is undoubtedly appealing, but I think the really successful ramblers in aphasia (whether it is called the Kingdom of Heaven or the lotus island) just have to leave the wife and kids at home It is love that makes the

world go round, and if you want life to stand still you must cut out the sex interest.

"... the end for which they work,
Beasts coupling with the groaning beasts they capture,
And all this dirt for just three minutes' rapture."

I interrupt my writing to go across to the children's school prize-giving. Fortunately it was just not raining after violent storms earlier in the day. One very small boy told his father he thought they'd had enough thunder and lightning and would he tell it to stop Father's failure marks the beginning of his descent from Olympus, and after his brief enthronement he can only look forward to a future of paying bills and being expected to cut up well. What a pity such exquisite children must one day grow up to look like us—homely, battered, raddled, edentulous, kyphotic parents but again I am expecting life to stand still like Keats's Grecian urn.

* * *

A less pleasant reminder of our mortality was a funeral service in a college chapel. In such surroundings the Church of England funeral service attains its full majesty, and he must be hard indeed who can hear without emotion the choir chanting "As soon as thou scatterest them they are even as a sleep; and fade away suddenly like grass . ." Funeral services in hospital chapels are often sadly unimpressive. The congregation is whipped up from somewhat unwilling students and preclinical teachers and a forced-labour battalion of nurses The obsequies are mechanically chanted by a chaplain who did not know the deceased and has taken no pains to find out anything about him. So disgusted was I by my early experience of these services that I decided to add a codicil to my will forbidding one over me My first experience of a more fitting ceremony was Ryle's address at Rowlands's funeral, and I have since become more and more firmly convinced that such a tribute to a colleague by a man who knew and loved him is the best arrangement for these melancholy occasions. Others of the same quality were Nelson on Melly, and all too soon afterwards, Roberts on Nelson—poor Nelson gone like a soldier on Armistice morning before we knew what sulphonamide could do. South of Durham there is no church more beautiful than St. Bartholomew the Great, and Roberts's address was that of a master over his favourite pupil. All these were men who died young or in full career, but most of us feel that sudden death in the late fifties is much less tragic than survival beyond our powers Cerebral atheroma is a long-drawn out tragedy for the audience with no relief before the curtain falls Only a little less pitiable are the withered females, relics of departed husbands or parents, who clutter the hotels of this and other countries, and form one of those elements of forgotten England which the tourist rediscovers. In ancient days these old bodies would have drifted to the edge of the herd and been picked off by marauding beasts The fast car inflicts its toll on them today, but the majority linger on, till one day the dinner-gong calls to them in vain and a few days later a casual group of relations arrives to strike the right note between decorum and festivity at lunch after the funeral.

Talking of forgotten England, a phenomenon which has been insufficiently discussed is the disappearance of the dummy When I went to school as a boy, every doorstep had its baby with a dummy, but now they have become as infrequent as the Norfolk jacket and the beard Like many of the innovations of the pædiatrician and the trained children's nurse—whom I blame almost entirely for the decline of breast-feeding—this move has not been altogether for good. The hygienic gain does not weigh with me, as babies have an ineradicable tendency to pick up and eat dirt from the floor. In the days of the dummy an epoch came, at about 3 or 4 years, when the dummy was banned and the child put away babyish habits of sucking. If babies don't suck a dummy they suck their fingers, and you can't take away fingers; so now children go on sucking their fingers and cherishing their sleep fetishes till well into school life. If I may voice another grievance against the march of modern hygiene it concerns the disappearance of the chamber pot. I am not referring to nocturnal searches round strange houses for the bathroom—or to that memorable evening in the residents' quarters when we had a wonderful if expensive curling match with these articles. Nor shall I discuss that difficult transitional period when it was there, but not used, a mere insurance against some sudden emetic or diuretic catastrophe. Merely as a gardener I lament the disappearance of that invaluable commodity, Household Slops, and all our modern fertilisers and auxins cannot quite replace the loss. The Esquimaux store all their urine in a tub and wash their long tresses in it before their dancing. The chemists extract from it the basic principles of virility and femininity, and I cannot but feel that here lies the clue to the difference between the wonderful blooms of the Chelsea show and the starvelings of my garden

* * *

John Mellanby's death is a major disaster for the Oxford medical school. Only a few weeks ago I was sitting next to him at dinner and he was being, as usual, the advocatus diaboli, suggesting that all human conduct was actuated by selfish motives, and that such ideas as service to humanity were utter cant. I agreed with him, arguing that my own activities were designed merely to release personal inner tensions and to forget for a time that I was a miserable human being, conceived in sin and born to trouble as the sparks fly upward But we were in the minority and the angels won, as well they might, when John was a living contradiction of his own statements His zest in life was great and he communicated to us his joy in Herodotus and Cellini But it was his unselfishness and common sense which were so valuable, when the Oxford medical school had the difficult task of administering a large sum of money with its hands tied. Nor are these universal virtues I am constantly surprised by the amount of jealousy in academic (not merely medical) circles and the extent to which professors will misuse their privileges and block the careers of their subordinates Mr. A. G. H Dent says that large-scale organisations suffer from numerous diseases—"committee-itis, departmental astigmatism, Napoleon complex, passing the buck and so forth"—and one can certainly find all those in a university. The Germanic conception of the professorial status and of the outstanding importance of one's own department, subject and researches, fills me with mingled wrath and amusement The wife of a minor member of the species grumbled for a time at her treatment in a nursing-home, "but as soon as they found out who I was, things were quite all right." Why the inflated self-esteem of *die Gelehrten?* A man needs to be very great before he can afford to be without humility and the milk of human kindness In our youth, said one of my cynical teachers, we choose science, and later on we wish we had chosen money Most

academic workers have no escape road and in the effort to make the most of what they have got, they sometimes lose their poise and exaggerate John Mellanby, on the other hand, was the happy warrior, who had done great things and was perfectly happy in his position and achievements

* * *

When I analyse my own position I often feel it a false one My scientific leanings are those of a student, with an interest in the synthesis and application of knowledge rather than discovery My opinion of clinical science is diffident and I feel that in its strict meaning of bedside science there is not much to be done 2300 years after Hippocrates except applied psychology and therapeutics (though that is quite a lot) It is, however, a necessary evil, for there must always be a province where the patient and the fundamental sciences come into contact Like other unhappy lands, Palestine and the Low Countries, whose fate it is to lie between great powers, clinical science has been the scene of much warfare I confess to having written editorials on both sides, but it has begun to get rather tiresome and I am all in favour of declaring it a neutral zone What then is my armour of righteousness? I suppose the facts that I am here by invitation and feel others must share the blame, that I have "chanced my arm" often enough in the past to show I am prepared to do so in the future, that I have earned quite a respectable living outside the academic fold and could venture out again And so I thank God for the station in life to which he has been pleased to call me, until the fate of these wretched refugees pricks my conscience When I read their curricula vitæ I feel, There but for the grace of God go I How many of us would survive the same scrutiny? The leaves of yesterday clutter up the bound volumes of the *Lancet* and the *Quarterly Journal of Experimental Physiology*, and how much has it all rotted down to? In the groves of science, kissing goes by favour, and a good manner and an elegant trick of presentation will advance a man far along the road A self made Lancashire man told me that the secret of success in business is to get into the "right click," and many of us can count ourselves lucky to have got fairly early into the right clique We are apparently torn between the desires of having the refugees here to bind up our wounds in time of war and of preventing them from eating our bread in time of peace. Shall I give my solution? One day, I hope not very far off, we shall have to provide proper, conservative dental benefit for an insurance panel that will include dependants as well as workers—i.e., the bulk of our population We shall then have nothing like enough dentists to go round If refugees with medical qualifications were encouraged to do the practical training necessary to qualify in dentistry, they might fill this gap and act as a medical reserve for times of war

* * *

Now comes a circular announcing that the Ministry of Health views with disapproval visits to Canada and U S A before the end of September, even though they are for the purpose of attending scientific congresses Well, it would have been a great rush as we had arranged it, a mere tumbling out of railway trains and planes and lecturing (in the specially air-conditioned theatre) and moving on again So perhaps another year we shall have more time

PARLIAMENTARY INTELLIGENCE

ON THE FLOOR OF THE HOUSE

By Medicus, M P

It is one of the duties of a Member of Parliament to attend at their Lordships' House to take part in the ceremony of the giving of the royal assent to acts of Parliament When the representatives of the House of Commons march in procession through the lobbies to the House of Lords they do so after a summons by a House of Lords official known as Black Rod And when Black Rod comes to the House of Commons to bring his summons the door to the chamber is banged in his face and he knocks ceremoniously three times—with his rod—to demand entry which is at once accorded The procession for the House of Lords goes straight from the House of Commons, the mace preceding it and the Speaker following it Then the faithful commons, or such of them as have gone there stand in a congested crowd behind the bar of the House of Lords to hear the royal assent given Usually it is given by a commission of three peers seated in their robes with hats on their heads and after the document signed by the King "with his own hand" has been read which gives them authority to act a list of bills passed by both houses is read and in Norman French the clerk bows and declares Le Roy le veult"

On Friday last there was a long list of such bills which by the ceremony became acts of Parliament—the members of the commission representing the King, members of the House of Lords and members of the House of Commons present constitute "Parliament" as an entity Among them was the Finance Act which rivets taxation on our necks for a year, various bills promoted by local authorities for sewerage, bridges and similar objects, a bill to prevent damage by rabbits, a bill to develop agriculture and a bill described as "Prevention of Violence (Temporary Provisions)," otherwise the I R.A. Bill This bill passed its final stages in both House of Lords and House of Commons on Friday, and, as the Speaker said, it was a good thing to let the world know that in an emergency Parliament can act with great speed

* * *

It is perhaps also a sign of the times that the House of Lords on Thursday of last week devoted some time and some plain speaking to the Milk No 2 Bill whose passage through the House of Commons, not unchequered with criticism, has been already recorded Lord Feversham in introducing the bill, claimed credit for the government in that it provided £250,000 for milk for mothers and young children in 1938 and increased the sum this year still further He merely mentioned that the money had not been spent and the milk not provided, but announced that "within the last few days" agreement had been reached with the Milk Marketing Board The purpose of the scheme is to enable the local authorities to provide milk for maternity and child-welfare arrangements at 2*d* a pint, a little more than half the ordinary retail price. The cost of milk supplied at less than 2*d* a pint will fall on the local authorities funds but the Exchequer grant will be sufficient to bring the Milk Marketing Board's returns up to 1*s* 2*d* a gallon in the year The distributive margin will be not more than 8*d* a

gallon and the Minister hoped that distributors would coöperate, but he did not mention that the Government had been unable to arrange for this coöperation from July, 1938, to July, 1939.

Lord Onslow raised the question of clean and safe milk, instancing the outbreak of typhoid at Poole and referring to the refusal of the Government to allow Poole and also Glasgow to promote local legislation for pasteurisation of milk Lord Snell spoke of his "almost continuous desire to avoid milk because of the dangers which were associated at least at one time" with its consumption. And it is worth noting that Lord Snell began his working life as a small boy on a farm.

Lord Luke drew attention to the vital question of milk for hospitals and said that every hospital bed needed 1½ pints of milk a day, a total of 7 million gallons per annum out of the 1100 million gallons consumed in the whole country. Lord Luke asked for milk for hospitals at a lower price Milk, he said, now accounts for a quarter of the total cost of hospital provisions and they could use more if the milk were cheaper. The cheap milk for making butter and cheese was mentioned—it may be as cheap as 6*d*. and 7*d* a gallon—but not the cheap milk for umbrella handles, luxury chocolates and other industrial purposes The Earl of Feversham said that the fact that hospitals are doing beneficent work is surely not a reason why producers of milk should give them preferential treatment to the extent of selling their milk at an unremunerative level. His lordship might have been asked if a greater consumption of liquid milk in hospitals at a cheap rate, subsidised if necessary like the milk-in-schools scheme, would not be saner economics than selling it at starvation prices for industrial purposes or, as sometimes happens when an ice-cream factory finds itself with a surplus, using it to flush the drains.

So neither Lord Luke about cheap milk nor Lord Onslow about safe milk got any more satisfaction in the House of Lords than did anyone in the House of Commons.

* * *

The debate on old-age pensions in the House of Commons was a debate on a very live political issue The increase in the average age of the population is making itself felt electorally and many thousands of old-age pensioners from all over the country have recently presented petitions to Parliament asking for an increase of the present 10*s* a week to 20*s*. The Labour Party proposal for contributory old-age pensions of 20*s*. for a single man and 35*s*. for man and wife has attracted the attention of the country and the censure of Government supporters, who say that in these times of financial stringency when we are spending 750 million pounds this year on armaments—only 250 million of which is paid for out of revenue—the Government cannot afford the 29 millions which increased old-age pensions would require during the first ten years But the contrast between the scale of armaments expenditure and that of old-age pensions has upset the psychological balance of contentment with things as they are, and many Government supporters as well as members of the Opposition are strongly in favour of a change The fact that present old-age pensions involve in many cases an appeal for additional help from public assistance has brought the local authorities into the controversy On the day of the debate the Minister of Health received a joint deputation from the Association of Municipal Corporations, the County Councils Association and the London County Council representing the views of every local authority in the country and pressing the Government to take action Mr. Arthur Greenwood for the Opposition and the Prime Minister for the Government were the chief adversaries but neither went to the heart of the matter which lies, as was suggested in the debate, in the creation of a ministry of pensions and insurance which would coördinate under a single roof all pensions and insurance schemes. Old-age pensions are worked at an expense-ratio of about 6 per cent., national health insurance costs 24 per cent., and industrial insurance 32 per cent

Immense sums are paid out each week for various kinds of insurance Annual premiums on burial policies total £65 millions, of which at least £20 millions could be saved by Government administration. And there are great capital assets which the Government could take over also A real and comprehensive insurance and pensions plan is feasible if the assets available are used. The obstacle is not money even at the present time it is wasteful administration of existing services.

FROM THE PRESS GALLERY

Marketing of Milk Products

IN the House of Lords on July 26, when the Milk Products Marketing Scheme, 1939, was approved, the Earl of FEVERSHAM said that it sought powers for the regulation of the marketing of butter, cheese, condensed milk, condensed skimmed milk, dried milk, dried skimmed milk, cream and sterilised cream. It would set up a board elected by producers of the various milk products, and the main objective would be to secure stability in the market for milk products

Earl HOWE called attention to a report that a company which made ice-cream had applied to the Brighton town council for permission to pour 1500 gallons of milk down the drain. He was sure that many people would give a good deal to obtain some of this milk —The Earl of FEVERSHAM said he understood that the milk in question was skimmed and therefore unfit for human consumption. It would receive the approval of the medical officer of health under the cheap-milk scheme. He agreed that every effort should be made to use such milk, but unless it was to be dried or condensed it would not come within the provisions of this marketing scheme, which covered only processed milks, or butter and cheese.—Lord ADDISON cordially agreed with the scheme, but hoped it would not be directed on lines limiting the supply. The incident to which Lord Howe had called attention was only one of many If there had been a scheme for the proper utilisation of milk products this scandalous waste would never have occurred.

[In the House of Commons on July 27 Mr THORNE asked the Minister of Agriculture if he would take action to prevent the Hove Dairy Company from pouring into the Brighton outfall sewers 1500 gallons per day of milk which was the residue from the manufacture of ice-cream; and if he was aware that the borough engineer stated at the council meeting that this milk was perfectly good —Sir WALTER WOMERSLEY replied I understand that an application was made to the Brighton Sewers Board by the dairy company in question for permission to discharge separated milk into the outfall sewer up to a maximum of the quantity stated in the question, in order to cover the contingency of the company not being able to handle or dispose of such supplies in the ordinary course of trade My information is that at no time have the company poured 1500 gallons of separated milk into the sewer, that no milk is at present being disposed of in this way, and that in the past only comparatively small quantities have been so dealt with The Milk Marketing Board is in touch with the company with a view to the avoidance of any waste of separated milk in future]

Lord ELTISLEY said that representations had repeatedly been made to the Ministry of Agriculture as to the need for standardising cream He recently came across a case where cream was supplied containing 23 per cent butter-fat Suddenly, without any intimation to the public, it was altered to 16 or 17 per cent. and the purchasers still believed they were getting the same quality of cream. He suggested that they might have a standardised 50 per cent

cream in ice-cream products and probably also a 28 per cent butter-fat cream

In the House of Lords on July 28 the House to House Collections Act received the royal assent

QUESTION TIME

JULY 27–AUG 2

Midwives and Analgesics

Sir EDMUND FINDLAY asked the Minister of Health what were the analgesic preparations used by state registered midwives and/or certificated nurses on their own responsibility in cases of childbirth —Dr SUMNER SKILL asked whether his attention had been drawn to the resolution passed by the British Medical Association deprecating the use of an analgesic by midwives, and whether, with a view to countering any ill effects of this resolution, he would make a statement to reassure the public as to the complete safety of the administration of gas by midwives —Mr ELLIOT replied I will take the opportunity of stating the position with regard to the administration of analgesics by certified midwives In January, 1936, following a careful investigation the Royal College of Obstetricians and Gynæcologists reported that the administration of nitrous oxide and air by Dr Minnitt's apparatus was safe for use by midwives under specified conditions The Central Midwives Board in October, 1936, accordingly passed a resolution recognising as treatment within the province of a midwife the administration of gas and air by Minnitt's or similar apparatus for the purpose of producing analgesia during labour, subject to the following conditions, which are those specified by the college (1) that she has, either before or after enrolment, received at an institution approved by the board for the purpose special instruction in the essentials of obstetric analgesia, and has satisfied the institution that she is thoroughly proficient in the use of the apparatus, (2) that the patient has within one month before her confinement been examined by a registered medical practitioner who has handed to the midwife a certificate in writing that the patient is in a fit condition for gas-and-air administration and (3) that one other person, being a state-certified midwife or a state registered nurse, or a senior medical student, or a pupil midwife, is present at the time of administration in addition to the midwife in charge of the case The ruling of the Central Midwives Board is the ruling of the statutory authority responsible and it will be seen that it allows the administration of analgesics by midwives in circumstances regarded as safe by the Royal College of Obstetricians and Gynæcologists Under such circumstances I think the public may be completely reassured as to the safety of the administration of gas by midwives

Miss RATHBONE Will the right hon gentleman undertake that this merciful practice of allowing midwives to administer an analgesic will not be interfered with by the selfish attitude of a certain portion of the medical profession who expressed their views the other day ?— Mr ELLIOT: It cannot be interfered with, that is the ruling of the Central Midwives Board which is the statutory authority

Sir EDMUND FINDLAY Will any action be against a midwife without this authority who administers an analgesic, notwithstanding the fact that a doctor might be some 20 miles away ?—Mr ELLIOT A certified midwife can administer an analgesic under the conditions which I have stated and which I think can be complied with by midwives even in distant parts of the country — Viscountess ASTOR Even to ignoring the presence of a doctor ? Sometimes they cannot get another person — Mr ELLIOT It is very desirable that some other person beside the midwife should be there

Dr SUMMERSKILL asked whether the Minister would state the number of local authorities providing a municipal midwifery service who were training midwives in the administration of analgesics and how many were refraining from using their powers —Mr ELLIOT replied: According to the returns made to me by local supervising authorities up to Dec 31 1938 29 of the 188 authorities concerned had made arrangements approved by the Central Midwives Board for the instruction of midwives in the administration of analgesics

Old-age Pensioners Receiving Relief

Mr TINKER asked the Minister of Health the number of persons in receipt of old-age pensions who were also receiving poor law relief in January, 1939, whether this showed an increase over the figures of January, 1938, and, if so, what was the percentage increase —Mr ELLIOT replied On Jan 1, 1939, there were 250,291 old-age pensioners in England and Wales who were in receipt of poor relief, representing an increase of 8 5 per cent on the corresponding number on Jan 1, 1938 The proportion of old age pensioners in receipt of poor relief to the total number of old age pensioners has accordingly also risen slightly, from 10 04 on Jan 1, 1938, to 10 5 on Jan 1, 1939

Nurses for Civil Defence

Mr ROSTRON DUCKWORTH asked the Minister of Health the measure of response to his appeal for extra nurses and auxiliary nurses, respectively, who would be needed in case of war —Mr ELLIOT replied By June 30 over 9000 trained nurses and assistant nurses had been enrolled, and 45,000 women had applied for training as nursing auxiliaries In addition about 24,000 immobile nursing members of voluntary aid detachments have been released from their service obligations with a view to their becoming available as nursing auxiliaries, and enrolment of these is now proceeding

Captain ELLISTON asked whether he, the Minister, could make an announcement as to the pay and conditions for trained nurses and assistant nurses of the Civil Nursing Reserve in war time —Mr ELLIOT replied Yes, Sir Trained nurses supplied by the Civil Nursing Reserve will in war time receive for whole time service a flat rate of £90 per annum, plus board and lodging The corresponding rate for assistant nurses will be £55 Trained nurses in charge of wards will have an additional allowance of £20 per annum In certain cases an assistant nurse may receive up to £65 per annum To these rates will be added free laundry or 3s 6d per week in lieu These rates have been recommended to me by the central emergency committee for the nursing profession, which includes representatives of the principal organisations concerned with nursing, including the General Nursing Council, the Royal College of Nursing, the voluntary hospitals and the local authorities Where trained nurses or assistant nurses are not provided with board and lodging an additional sum of one guinea per week will be payable As already announced, the rate for nursing auxiliaries will be £2 a week non resident for whole time service

Register of University Teachers

Mr SILKIN asked the Minister of Labour whether the register of university teachers referred to in the National Service Handbook had been compiled, and what forms of service they would be called upon to undertake —Mr LEWIS BROWN replied Members of staffs of universities have recently been recircularised to ascertain their willingness to be enrolled on the central register of persons with special qualifications and the bulk of the replies have now been received The object of the register is to provide a ready means of selecting qualified persons for vacancies in war time as and when they may arise, it is not, in general, possible to specify these vacancies in advance, nor is any guarantee given that a post will be offered — Asked what kind of employment they would be called on to undertake, Mr Brown said he could not answer that in reply to a supplementary question There was a whole range of scientific and special forms of employment available

Professional Women and National Service

Mr SILKIN asked the Lord Privy Seal whether he was aware that there were many professional women anxious to render national service but were incapable of taking up physically strenuous work and whether he would make known the forms of national service in which the training and experience of such women could be utilised —Sir JOHN ANDERSON replied Women with special professional scientific or technical qualifications who would be prepared to undertake work of a specialist

character in the event of emergency should communicate with the Ministry of Labour, which is maintaining a central register of the names of persons so qualified who would be available in time of war to meet the needs of Government departments and industrial concerns for additional technical and professional staff.

London University Students and Evacuation

Mr. SILKIN asked the parliamentary secretary to the Board of Education whether he was aware that students of Queen Mary College, London University, were to be evacuated to Cambridge in the event of a national emergency, and whether, as they would be required to pay £2 a week, he would say what steps he proposed to take in the case of those students who had not the means to pay this sum.—Mr. KENNETH LINDSAY replied: The evacuation arrangements affecting London University students are being made by the appropriate university authorities, who will be responsible for considering any necessary financial measures.

Diphtheria Inoculation in Guernsey

Mr. GROVES asked the Home Secretary how many children who had been inoculated against diphtheria in Guernsey, over eight weeks, had contracted diphtheria since the immunisation scheme was started, and how many inoculated children, less than eight weeks after the inoculation, had contracted diphtheria since immunisation started.—Sir SAMUEL HOARE replied: I am informed that the numbers are 23 and 17 respectively.

X-ray Apparatus

Mr. HOPKIN asked the Minister of Health if he was aware that a portion of a large number of X-ray units for civil hospitals in time of emergency now being constructed for or on behalf of the Ministry of Health was being fitted with X-ray tubes of British manufacture and a greater portion with foreign X-ray tubes, although British tubes were available and efficient; and would he recommend that only British X-ray tubes be fitted in all such units.—Mr. ELLIOT replied: The majority of the tubes for mobile X-ray apparatus ordered for the emergency hospitals are to be British and the remainder American. The orders were placed with the British X-ray Engineers' Association and allocated by them to all the firms in the industry in this country. In the present state of the industry it would not be practicable to insist upon the exclusive use of British tubes.

Unemployed Men and Keep-fit Classes

Mr. THOMAS WILLIAMS asked the Minister of Health if he was aware that certain keep-fit classes for unemployed men were unsatisfactory because members of the class become hungrier than usual as the result of exercise and they could not afford any extra food; and what steps were being taken to remove this disability.—Mr. ELLIOT replied: I have no information about the matters referred to, but they do not appear to fall within the province of my department.

Drug Traffic in China

Sir JOHN HASLAM asked the Prime Minister whether the Japanese government had yet been approached with regard to their failure to control opium dens in the Japanese-occupied area surrounding Shanghai, and the distribution of heroin and other drugs in the various parts of China in their occupation.—Mr. BUTLER, under-secretary for foreign affairs, replied: The reply is in the negative, but His Majesty's Government have under immediate consideration possible representations to the Japanese government on the drug situation in the occupied areas of China.

Milk for Expectant and Nursing Mothers and Children

Dr. HADEN GUEST asked the Minister of Agriculture when he anticipated that the plan for providing cheap milk for expectant and nursing mothers and children under five years of age, as provided under the Milk Amendment Act of 1938 and under the Milk Bill of 1939 would come into operation.—Sir REGINALD DORMAN-SMITH replied: I am happy to say that a scheme for the provision of milk to local authorities in England and Wales at reduced prices for consumption by expectant and nursing mothers and children under five years of age was submitted by the Milk Marketing Board and approved by me on July 26. The scheme comes into force as from today and I hope that it will be possible to lay it before Parliament within the next day or two. My right hon. friend the Minister of Health will issue at the same time a circular letter and an explanatory memorandum to local authorities, with whom the initiative will then rest. I cannot at present say how soon it may be possible to bring the arrangements into operation in any given district.

Disability Pensioners

Mr ELLIS SMITH asked the Minister of Pensions how many men were in receipt of disability pensions for injuries received during the great war, and the number that were pensioned at 100, 80, 60, 50, 40, and 20 per cent respectively.—Sir WALTER WOMERSLEY replied: The number of officers and men in receipt of pension for disablement caused by wounds and injuries, as distinct from diseases, on March 31, 1939, was approximately 227,900. The records of my department do not enable me to give separate figures in respect of wound and injury cases for the various rates, but the total numbers of all classes of disability cases pensioned at the rates specified were as follows:—

100 per cent ..	26,703	50 per cent. ..	50,911
80 ,, ..	14,010	40 ,, ..	50,253
60 ,, ..	33,088	20 ,,	112,600

Mr. ELLIS SMITH asked what number of pensioners had died during 1938; how the figures compared with those of the civil population; and how many of the widows were in receipt of a pension under the royal warrant.—Sir WALTER WOMERSLEY replied: If, as I presume, the hon member has disability pensioners in mind, the reply to the first part of his question is the number of deaths from all causes of this class of pensioner of non-commissioned rank, in the financial year ended March 31 last, was 7480. This represents a death-rate of 18·9 per 1000 pensioners. The death-rate for the corresponding age-group in England and Wales was approximately 12·9 per 1000. The records of my department do not enable me to say how many widows of the men who died during the period concerned are now in receipt of pension.

Blood-transfusion Volunteers

Mr. VIANT asked the Postmaster-General if he was aware that members of his department offering themselves as blood-transfusion volunteers were to bear the cost of substitution if called for service, and no sick-pay was to be allowed for sickness arising out of an operation; and whether he would, in the interest of national service, reconsider these conditions.—Major TRYON replied: I assume that the hon. member is referring to the emergency scheme for blood-transfusion volunteers. So far as the clerical staff is concerned there is no objection whatever to their volunteering and no difficulty would arise about their being released for actual blood-transfusions. The remainder of the Post Office staff are for the most part engaged on the maintenance of national services and their release for actual transfusions would necessarily be dependent on the exigencies of the service. The preliminary blood-tests can usually be undergone outside official hours of duty and no payment for substitution would be required in the case of volunteers released for actual blood-transfusions in time of national emergency. I have considered the position as regards sick-pay. In future this will be allowed, subject to the ordinary rules, in the event of sickness arising out of blood-transfusion.

Voluntary Hospitals and Civil Defence

Sir IRVING ALBERY asked the Minister of Health what complaints he had received from the voluntary hospitals concerning the proposed Government contribution in case of war casualties, and what action he proposed to take in this matter.—Miss HORSBRUGH replied: The matter is now under negotiation but the Government have accepted full responsibility for the cost of treatment of war casualties in voluntary hospitals. The Government propose to make payments on account, subject to adjustment at a later date. The precise basis of the payments and points arising out of the proposals are under discussion with the British Hospitals Association.

LETTERS TO THE EDITOR

MEMORIAL TO SIR ROBERT BOLAM

SIR,—For a considerable time before his death many friends and colleagues of Sir Robert Bolam in the University of Durham and in the hospitals associated with King's College had been considering the desirability of making a presentation to him in the form of a portrait There is now a widespread feeling that such a project should be proceeded with as a memorial to him

As is well known, Sir Robert in addition to his recent activities with the new buildings of the medical school had a very long association with the former College of Medicine and with the Royal Victoria Infirmary He served both of these institutions in various capacities In the College of Medicine he was in turn lecturer on physiology and pathology, joint lecturer on physiological physics and chemistry, professor of medical jurisprudence, sub curator of the museum, while in the Infirmary he was assistant physician and pathologist, later becoming the first honorary physician in charge of the skin department and held this post until his retirement from the Infirmary staff in 1931, when he was appointed honorary consulting physician to the skin department The accompanying lectureship in dermatology in the College of Medicine he held from 1914–37 He also served with distinction as the University of Durham representative on the General Medical Council and was well known for his activities on other bodies, notably the British Medical Association, of which he was for some time chairman of council In recent years he devoted much of his time to the administration of the College of Medicine and to the general work of the university, acting as registrar to the college and later as president and chairman of council, he was also in 1936–37 vice-chancellor of the university

Since the reconstitution of the university Sir Robert's main energies were devoted to the erection of the new buildings for the medical school and as chairman of the building board he was able to see the completion of that task. It seems fitting that as the last president of the College of Medicine and as one who devoted so many years to the interests of medical education his name should be perpetuated by a suitable memorial It is proposed therefore to raise a fund, to which subscriptions are invited, to be devoted to the following purposes —

(1) A portrait in oils

(2) A memorial tablet to be placed in a suitable position in the medical school

(3) To augment an existing fund the interest of which is to be applied as a prize in dermatology

We are, Sir, yours faithfully,

LONDONDERRY, J F DUFF, EUSTACE PERCY, ARTHUR M SUTHERLAND, JOSEPH REED, RALPH MORTIMER, R J WILLAN, F C PYBUS, R B GREEN (Dean)

The Medical School, King's College Newcastle-upon Tyne, July 26

A NATIONAL COUNCIL FOR MENTAL HEALTH

SIR,—In your summary last week (p 274) of the report of the Isaversham committee, referring to the proposed new National Council for Mental Health, you state "it appears that the Mental After Care Association has not yet seen its way to coöperate" It is true that this association has resisted the very strong pressure put upon it to become part of a limited liability company by means of what the report calls "a complete merger, each contributing society losing its identity in the corporate whole" It is, however, misleading and inaccurate to describe this difference on principle as a refusal to coöperate

The Mental After-Care Association, which is by a very long way the senior of the organisations concerned, has made unceasing attempt at friendly coöperation with all of them in every possible way and, in particular, by following the principle of "mutual assistance without interference" which is a golden rule for fellow workers in the field of mental health In my dealings with the Feversham committee on behalf of the association I have every reason to believe that my endeavour to maintain a friendly and coöperative attitude, without abandoning principle, was not entirely unsuccessful The general policy of the association was fully expounded at its annual meeting last spring, when, after an admirably impartial review of the whole situation, our chief speaker Lord Blanesburgh summarised our attitude in three words "Coöperation, not amalgamation"

In these circumstances I am sure that you, Sir, will appreciate my desire to remove any misapprehension which the phrase in your summary may have caused —I am, Sir, yours faithfully,

HENRY YELLOWLEES,
Chairman of Council Mental After-Care Association
Grand Buildings Trafalgar Square, W C 2, July 28

RESTORATION AFTER EXCISION OF MAXILLA

SIR,—In your issue of May 27 Mr Greer Walker writes on the application of prosthetic apparatus after excision of the maxilla As regards function as well as time he distinguishes between appliances inserted immediately and those constructed and adapted much later, when healing is complete I suggest that this distinction is not only unnecessary but will lead in many cases to difficulties of the kind he describes In a communication written with the late Mr C H Bubb (*Brit med J* 1916 1, 268) it was shown that separation of the nasal from the oral cavity, restoration of the masticating surface, and restoration of facial contour, could and should be secured at one and the same time, provided that the apparatus was inserted soon after operation—preferably after an interval not longer than three to four weeks This question of functional and cosmetic restoration after destructive operations on the jaws was further elaborated by me in your own columns (*Lancet*, 1920, 2 845) A point hitherto not raised is the possibility in selected cases of hinging the mucoperiosteum on the oral surface of the hard palate and throwing it upwards and outwards to line the raw surface of cheek above the level of the buccal sulcus —I am, Sir, yours faithfully,

Wimpole Street, W 1, Aug 1 PERCIVAL P COLE.

BITOT'S SPOTS

SIR,—Dr Nicholls in your issue of June 24 suggests that there may be two forms of xerosis of the bulbar conjunctiva an acute and a chronic form, and that only in the former do Bitot's spots appear to be covered with a white foam During a recent investigation into vitamin A reserves in African natives it was my good fortune to see several cases where natives who were normally accustomed to a generous and well balanced diet had been forced to subsist on a diet completely lacking in vitamin A

These consisted of native police and servants of prospectors and surveyors who had been in the bush for some considerable time, living almost exclusively upon maize-meal and beans Other cases occurred among a group of school-children who were boarders at a school where the diet provided was essentially similar. Bitot's spots appeared in about 25 per cent. of the cases of night-blindness that occurred, usually between 5 and 9 weeks after the commencement of the deficient diet The foaming type was almost general and was accompanied by excessive lacrimation Contrary to Dr. Nicholls's experiences with what he suggests is the chronic form, these lesions healed up a few days after treatment with large doses of vitamin A had started. Further, night-blindness invariably preceded the development of the spots.

This evidence appears to support strongly Dr. Nicholls's suggestion as outlined above

I am, Sir, yours faithfully,

ALAN MCKENZIE

The Government Hospital, Morogoro, July 26

BRUIT DE FOUET?

SIR,—We have come across an unusual physical sign which we have not seen recorded in the literature The patient concerned was a Zulu male, suffering from pulmonary tuberculosis. He developed a severe pain in the right side of his chest and abdomen. When he was examined a loud leathery pleural rub was evident. We diagnosed a fibrinous pleurisy Diaphragmatic extension would account for the abdominal pain Five days later when the patient was feeling much better, the pleural rub had gone and normal breath sounds were audible When the patient gave a cough a loud crack was heard, as if someone had flicked the end of the stethoscope with a finger The sound recurred every time the patient coughed. We think the explanation was as follows. The cough suddenly tore many sticky fibrinous adhesions, which remained glued together during normal respiration We have not heard this sound before We would like to know if it has been recorded, and if our explanation is correct

We are, Sir, yours faithfully,

C. A H. WATTS,
B M. WATTS

Bishop Roach Memorial Hospital, P O Nkandhla, Zululand, S A., July 21.

PROFESSOR BLEULER

SIR,—Your annotation last week on the death of Professor Bleuler prompts me to record a little story of the great psychiatrist When nearly 80, after he had retired from the directorship of the Burghölzli Mental Hospital, he took up motoring His efforts as a chauffeur were at first distinguished more by enthusiasm than skill. One day, as he was pursuing an erratic course down the main street of Zürich, a cabby shouted at him, "The place for you is the 'Burgholzli". To this, Bleuler shouted back, "my friend! I have only just left it"

I am, Sir, yours faithfully,

Aug 1 L DRIVER

MEDICAL NEWS

Royal College of Physicians of London

At a meeting of the college held on July 27, with Sir Robert Hutchison, the president, in the chair, the following fellows were elected officers for the ensuing year:—

Censors: Sir Maurice Cassidy, Prof W E Hume, Dr Anthony Feiling, and Prof F. S Langmead Treasurer: Sir Charles Wilson Registrar Dr H L Tidy Harveian Librarian Dr Arnold Chaplin Assistant Registrar: Dr Reginald Hilton Library Committee Dr Herbert Spencer, Sir Adolphe Abrahams, Dr J D Rolleston, and Dr Charles Newman Finance Committee: Dr A M. H Gray, Dr J. P Hedley, and Dr H E A Boldero

The following were elected examiners:—

Chemistry Mr J E Facer and Prof W B Tuck, D Sc Physics Mr J H Brinkworth, D Sc, and Prof F L Hopwood, D Sc, Materia Medica and Pharmacology Dr E B Verney, F.R S, Prof E J Wayne, Dr H. A Dunlop, Dr J W de W Gray Thornton, and Prof J H Gaddum Physiology: Prof B A McSwiney and Prof R J Brocklehurst Anatomy: Prof R D Lockhart Pathology: Dr Geoffrey Bourne, Dr F J Nattrass, Prof. J H Dible, and Prof G P Wright Medical Anatomy and Principles and Practice of Medicine. Prof G W Watson, Dr George Graham, Sir Charles Wilson, Prof F E Tylecote, Dr R A Rowlands, Dr J A Drake, Dr Arnold Stott, Dr Geoffrey Marshall, Dr R A Hickling, Dr D T Davies, Dr Kenneth Harris, and Dr H H Carleton Midwifery and Diseases peculiar to Women: Mr Clifford White, Prof A Leyland Robinson, Mr D W Roy, Mr Frederick Roques, and Mr Arthur Gray Public Health: Part I, Dr J M Hamill; Part II, Dr James Ferguson Tropical Medicine: Prof Warrington Yorke, F R S, and Lieut.-Colonel J S Knox Boyd Ophthalmic Medicine and Surgery. Dr J Purdon Martin Psychological Medicine. Part I Dr Eric Strauss; Part II, Dr C P Symonds and Dr G W B James Laryngology and Otology. Mr Lionel Colledge Radiology: Prof Sidney Russ, D Sc., and Dr Russell Reynolds Anæsthetics: Dr C L Hewer Child Health. Dr H C Cameron and Dr Norman Capon Murchison Scholarship (1940): Dr Terence East and Dr H K Goadby

Dr H. L Tidy was re-elected representative of the college on the General Medical Council Lord Horder was appointed Harveian orator for 1940 and Prof Henry Cohen Bradshaw lecturer for 1940 The Moxon medal for researches and observations in clinical medicine was awarded to Sir Arthur Hurst, the Baly medal for physiological researches to Prof C H Best, F.R S. (Toronto); and the Weber-Parkes prize and medal to Sir Pendrill Varrier-Jones for his work on tuberculosis at the Papworth Village Settlement. The Murchison scholarship was awarded to Dr A J M Drennan (Edinburgh)

The following candidates, having satisfied the censors' board, were admitted to the membership —

D R Allison, M D Leeds; I M Anderson, M B Glasg, H C Aston, M B Birm, D A K Black, M B St And, C R B Blackburn, M D Sydney, W A Brend, M D Lond, M E Chinner, M D Adelaide, J F C C Cobley, M B Sydney; D R Davis, M.B Camb, R B Evans, M D Lond, Major J C Gilroy, R.A.M C, M B Edin, Raymond Lewthwaite, M D Oxfd, B J Malley, M B Dubl, S F Marwood, M D Lond, W M Philip, M B Lond, W N Pickles, M D Lond., D S Scott, M B Camb, Ralph Southward, M B Glasg; J F Stokes, M B Camb, Monty Toohey, M B Dubl, Joseph Walter, M B Oxfd, H T H Wilson M B Camb, and Roger Wyburn-Mason, M B Camb

Licences to practise were conferred upon the following 202 candidates (185 men and 17 women) who have passed the final examination of the conjoint board —

Stephen Ackroyd, Camb and Middlesex, G A. S Akeroyd, St Bart's, T D Ap Ivor, Univ Coll, R H Armin, Camb and St Thos, J W Ashley, Oxfd and Middlesex, A H B Atkinson, Middlesex, E H Bailey, Westminster, J P B Ball, Westminster; Rosalind S Barclay, Manc, P H Beales Guy's, A D Bell, Guy's, A J S Bell Tawse, Camb and Middlesex, C J Bintcliffe, St Bart's, Theodore Bliss, Charing Cross, A D Bone, St Thos, Irene M Bower, Manc, L H Boyd, Guy's, J C Bryce, Univ Coll, F R Buckler, Guy's, J L Cardwell, Camb and St Bart's, D M F Carter, Guy's H A C Chalmers, Westminster, Prakash Chandra, Wee Lond and Prince of Wales C K Cole, Guy's, Frank Constable, Univ Coll, J F Cooper, Charing Cross, J G S Crabbe, Birm, R P Crick, King's Coll, J S Crone, Guy's, G S Cross, St Thos, Barbara Cunningham, Camb and Brist, Harbhagwan Das, Prince of Wales, P H Davison, Birm, P F H Dawnay, St Bart's; J H Dean, Camb and Middlesex; V K Desai, Bombay; E P De Silva, Ceylon, M H L Desmarais, St Bart's, H P Dick, Camb and Guy's, O P Dinnick, Middlesex, J F Donovan, Cardiff, A J Drew, Guy's, F L Dyson, Univ Coll, P M Elder, St Bart's, S D Elek, St George's, J R Esplen, Lpool, E G Evans, St. Bart's, R F Evans, Univ Coll; Jacob Feldman, Middlesex, Betty Fox, Brist, D M I Freeman, Lpool, R C Fuller, St Mary's; M R Gardiner, St Thos, J H P Gauvain, St Bart's, J H Gibson, Birm; P W W. Gifford, Birm, P A Gimson, St Bart's; F N Glover, Guy's, J A Glover, Camb and London, N G Godfrey, Sydney, G D Graham, Camb and St Bart's, R N. Grant, Camb and St Bart's, J. H Graves, St Thos, R A Gregory, Univ Coll; C J Griffin, Univ Coll, Aelwyn Griffiths, Cardiff, Peter Griffiths, Univ Coll, Sandow Grodd, West Lond; E. R

Gubbay St George's, Cyril Hamwee Manc B J Harries, Univ Coll, G F Hay, Bitm, K M Hay, Camb and St Bart's, M R Hayes, St George's, G O Haywood, St Mary's, A Helps, London, David Hewspear Manc. J F Holden, Middlesex, E T Holman Manc and Bath Hannah Horton, Manc, D G Howatson, Middlesex, Ruth M Howitt, Camb and King's Coll, F R Hudson, Middlesex, I R Hurford, Brist, J P F Hummel, Leeds, J C A Innes, London, K G Irving Camb and St Bart's, P W Isaac, Camb and St Bart's, S A James, Middlesex, J W W Jay, St Thos, G H P John Camb and St George's, G M Jones Charing Cross, J A Jones, Guy's, P J O Kendall Camb and London, D S Khatri, Bombay, R R Klein, King's Coll, Thomas Kramer London, W C Lawrence Guy's, G C Lee St Thos, A Leigh West Lond, D C Lewin, Guy's, Katharine I Liebert Manc, J S A Linton, St Bart's, L H Lithman Charing Cross, J A Lorimer, Camb and London, Frank Luckett King's Coll, H F Lunn, Guy's, I D MacDonald, St Thos, F M McGown, Camb and London, C W F McKean Camb and St Mary's, Arthur Mackler, King's Coll, P D MacLellan Camb and Univ Coll, L A H McShane St Bart's, J L Malcolm, St And, A R Marshall, Cardiff, P W M Martin St George's, P Massie Manc, Zeta M U Matthews Univ Coll, A J May, Middlesex, W R May, St Mary's, Ivor Mazure Charing Cross, H R Miller, St Mary's, D A Milln London, F L Moll, Guy's, R W Moore, St Mary's, A R D Newsholme, St Thos, James Worth St Bart's, G O Nowell Birm, A O Obunnesian St Bart's, C A Osborn St Thos, G A Owen Westminster, Jeanne L G Palmer West Lond, F H Patel Edin, Eleanor M Pearson, Lpool, H N Peyton St. Bart's, C H Phillips Guy's, F R Philps Univ Coll, M F Pilcher Univ Coll, J Pooley Birm, Porter St Mary's, B W Powell Camb and St Thos, Harry Pozner, Univ Coll, C L Pretre London, Tom Price Lpool, T G Pritchard, Guy's, Margaret P Rhodes Roy Free, J F Richardson, London, P B Riley St Thos, Basil Robinson, Cardiff, Benjamin Roditi, Manc, Kenneth Rostron Lpool, David Rumsey, Univ Coll, R D Rutherford, St Thos, B M Sanderson, St Thos, P T Savage London, Margaret M Schofield, Leeds, F W Schnienburg Cape and London, P D Scott, Camb and London, Israel Segal, Univ Coll, F H Wade Camb and Univ Coll, J T B Wakeham, Guy's, D B Wallis, Camb and Lpool, H R E Wallis, Camb and King's Coll, Eric Wardle Lpool, Margery B Webb, Birm, S E White Westminster, Francis Whitwell St Thos, G S Wigley Guy's, A F Williams, Manc, Gwyn Williams Guy's, John Williams, Birm, A N Wilson London, G F W Wolstenholme, Camb and Middlesex, B W Wood King's Coll, I A F S Wood St Thos, J C Wyatt St. Thos and W J Zorab King's Coll

The following diplomas were granted jointly with the Royal College of Surgeons to the following:—

D T M & H—H W Bennett, M I Bruce, D A Cannon, A J P Coetzee, W W Cowen, J T F de Soyza, C M Hopkins, E A Hunter, L H James, Guan Bee Kruatrachue, Amedeo Limentani, J M Liston, K J Mann, P E G Manson Bahr, Ba Maung, R W D Maxwell, M C Osgood, D H S Rajapakse, H J Riddell, Mariam P Samuel, L M Sanghvi, D K Sundaresan, S I Townsend and M K Wasti.

D O M S—G C Banerji, C J F Blumenthal, G K Burr, W G L Flather, J B George, S N Gupta, J L Hart, G G Hill, Ida Hodder, A L Ieesman, P P Kerwick, Anne L MacDonald, Annabella McGarrity, T P Myles, P K Pal, W D Pierce, V F Pittar, H B Porteous, R L Raymond, Bridget F Riordan, A F I Shields, S R Sinclair, H M Singh, W K Smiley, Edith M Spencer, Harris Stange, H M Symons and L M Turner.

M R—L M Billingham, Madhusudan Das Michael Gelfand, and B D Houston.

Diplomas in anæsthetics public health psychological medicine and laryngology and otology were also conferred on the candidates named at the meetings of the Royal College of Surgeons reported in THE LANCET June 17, *p 1413* and *July 22 p 200*.

The college has closed for cleaning, and will reopen on Sept 11.

Royal College of Surgeons of England

An ordinary meeting of the council of the college was held on July 31 with Mr Hugh Lett, the president, in the chair. Mr L R Broster was re-elected a member of the court of examiners.

Dr Alan Moncrieff was elected to an examinership for the diploma in child health and under the conjoint Board. Mr G K Harrison was re-appointed a Leverhulme scholar for a second year.

The council decided to apply for the grant of a supplemental charter to give the college power to grant a higher dental diploma entitled "master surgeon dentist," and for power to elect annually to the fellowship not more than four Members of the college of twenty years' standing.

A licence in dental surgery was granted to T C Henry. Diplomas of membership and diplomas in tropical medicine and hygiene, ophthalmic medicine and surgery, and medical radiology were granted to the candidates mentioned above in the report of the meeting of the Royal College of Physicians.

The following hospitals were recognised for the six months' surgical practice required of candidates for the final examination for the fellowship:—

Redhill County Hospital, Edgware (the house surgeons to the two senior surgeons) (under special conditions), Grimsby and District Hospital (resident surgical officer).

University of Oxford

On July 29 the following degrees were conferred:—

J M Couchman, L E C Davies, R G Fagge, and N A Neville.

University of London

At recent examinations the following were successful:—

M D

Branch I (Medicine)—I S Buchanan, M A Carpenter, J L Cates, C S Darke (university medal), R B Evans, A C Kanaar, David Landsborough, D H G MacQuaide, J R Phillips, J W Pierce, Hugh Ramsay, J C Roberts, G R Royston, F H Scadding, and J W Todd.

Branch IV (Midwifery and Diseases of Women)—Mary A M Digby and C W F Burnett.

Branch V (Hygiene)—J D Kershaw, V N Leyshon, J P McGladdery, and R O Wolfenden.

FINAL EXAMINATION FOR THE DEGREE OF B D S

—J C Hancock (with honours), Howell Rees, and D L Rugg-Easey.

Group I—K R. Titford.

Group II—W J Head.

Scottish Conjoint Board

The following candidates, having passed the final examination, were admitted licentiates of the Royal Colleges of Physicians and Surgeons of Edinburgh, and the Royal Faculty of Physicians and Surgeons of Glasgow:—

Gerald Abromowitz, W S Aird, Tom Akroyd, George Altenbaum, F P Ampofo, D A Bird, Milton Bregman, G F Calvert, R M I Charles, W J Curran, W N Darling, Edward Dengrove, Gerald Dixon, Carl Drayer, Edith M Druitt, R S Edlington, A F Fletcher, W M Glantz, H T Hardy, Mary K Hargreaves, Barbara J Hawke, David Hochman, J A Hunter, Phillip Jardine, J R K Keatley, Thomas Khattar, R Lavrie, A S Lee, Malek W A W Manny, E B Marke, J G H Maree, S R A Messih, Ian Mickelli, Henry Mullen, A J MacIver, W T B McAllister, C W Orr, H H Pace, E G Patchett, Nathaniel Pearl, T J Reid, Mary Robertson, A W Robinson, J Rosenblatt, Cyril Rudd, Louis Ryterband, G J Sabrin, C D Salmond, Milton Schneider, N M Segal, R M F Smith, F J Stern, I L Theron, G A Thompson, C M Vanniasegaram, and D K Windram.

The following graduates of recognised foreign universities were also admitted licentiates:—

Abraham Adler, A B Alexander, D R Barry, Adolf Beck, Max Caraco, Walter Cohn, Wladimir Griffel, Erich Guttmann, Lewin Hakefeld, A Heimann, R F H Hinrichsen, Mirjam Laufer, Ella Haims Levi, Chain Paree, I F Rosenthal, and Ralph Spira.

Association pour la documentation photographique et cinematographique dans les sciences

The seventh congress of this association will be held in Paris on Oct 12 and 13. Members will meet on the first day at the Palais de la Découverte (Grand Palais) avenue de Selves, and on the second at the Musée Pedagogique de l'Etat, 29 rue d'Ulm. Further information may be had from Dr Charles Claoué, 39 rue Seleffer, Paris, 16e.

Kathleen Schlesinger Fellowship

The Medical Research Council have appointed Dr Gwen-ron Griffiths to this fellowship for the year 1939–40. The fellowship is provided from a fund established by the late Mr Eugen M Schlesinger and Mrs Schlesinger in memory of their daughter and is given for investigations of cysts of the brain or allied conditions. It is ordinarily tenable at the National Hospital for Diseases of the Nervous System, Queen Square, London.

St. Mary's Hospital

The annual dinner of the medical school will be held at Claridge's on Saturday, Sept. 30. Dr Walter Broadbent will be in the chair The annual postgraduate course, which is open to all practitioners without fee, will take place on Sept 28, 29, 30, and Oct. 1

Industrial Health Research Board

The Medical Research Council have appointed Dr. Donald Hunter and Mr Harold E Clay, national secretary of the passenger services group of the Transport and General Workers' Union, to be members of their Industrial Health Research Board in succession to Prof J A Nixon and Mr. R Coppock

Evacuation and Billeting

The Minister of Health is urging local authorities to stress the importance of registration of children to be evacuated House-to-house canvassing, it is suggested, should as far as possible be done in the evening when both parents are at home. Appeal tribunals are to be set up in an emergency in each district, to which householders aggrieved by billeting requirements may appeal. Each tribunal will have three members, of whom one would be a woman. Evacuating authorities are to see that enough midwives are sent with the expectant mothers Arrangements are also in hand for extra isolation accommodation for infectious illnesses and for midday meals at school for evacuated children Prepaid postcards are to be supplied on which the children and mothers may inform their families of their new address

War Neuroses

On July 3 the Minister of Pensions summoned a conference of specialists in nervous diseases and representatives of the Services to discuss the mental and emotional disturbances liable to arise in war-time, and to advise him as to the basis on which treatment and compensation for "fear-neurosis" would best be applied in a war. The chair was taken by Lord Horder and those present included Sir Hubert Bond, Sir Farquhar Buzzard, Dr. Bernard Hart, Dr Gordon Holmes, Mr. J. H. Macdonald, Dr E. Mapother, Dr. H Crichton-Miller, and Dr W. Aldren Turner, the directors-general of the medical services of the Air Force, Army, and Navy, and medical and other representatives of the Ministry of Pensions A subcommittee was appointed to put forward a practical scheme and this held its first meeting on July 31.

Nursing Conditions

The Minister of Health has issued a circular to local authorities drawing attention to certain suggestions made with regard to conditions of work in hospital nursing by the Athlone committee. The accommodation in the nurses' home, the circular points out, should reach a proper standard of comfort Permission to live off the premises of the hospital might be more freely given, particularly if married nurses are in future (as is proposed) more widely employed. Nursing staff, including probationers, should as far as possible be relieved of domestic work through the employment of ward-maids and orderlies Hospital rules should be revised in order to secure the removal of unreasonable restrictions which have often caused dissatisfaction All hospitals should have a time-table showing on-duty and off-duty times for at least a fortnight in advance, and nurses should have at least four weeks' annual leave, with proper notice well in advance. The standard of catering for the staff should be improved and more care should be devoted to the nurses' health Reforms of this kind are desirable not only in order to overcome the shortage of recruits to the nursing profession, but also because they promote the primary object of nursing care, the well-being of the patient, by ensuring the health and contentment of the nurse

At the meeting of the council of the Royal College of Nursing on July 20 Miss Coode, the vice-chairman, reported that the Minister of Health had given sympathetic consideration to the proposals of a deputation from the college dealing with the control of the assistant nurse, negotiating machinery for the nursing profession and pensions The deputation asked that the Government would promote legislation for the licensing of all "who nurse habitually and for gain" so that the public and the state-registered nurse will be protected against competition from unqualified persons and the public cannot be served by an "assistant nurse" when they think they are employing and are paying the fees for a state-registered nurse. The college advocated one general national pension scheme and proposed that the federated superannuation scheme for nurses and hospital officers (contributory) should be adopted for this purpose. This would permit complete freedom for every nurse to move from one service to another as her career advanced and would benefit nursing as well as the individual

TINCTURES BY THE TON

THE supplies department of the L.C.C. has to cater for the physical and mental needs of 113,000 patients, inmates and staff of the L C.C. institutions, not to mention 800,000 teachers, students and school-children who for part of each day are in the council's hands. It is responsible not merely for obtaining estimates and making purchases, but also for storage, delivery and stocktaking Its story for 1938-39 is told by W. T. Wilson, the chief officer of supplies, in his annual report. No less than 459,064 orders were given to the contractors in the course of the year. In the 1938 crisis the department arranged to buy and distribute among other things about 200 miles of black Italian cloth, 150,000 Rawlplugs, 250,000 yards of wire, 28,800 night-lights, and 54,000 candles. The medical supplies section thinks in astronomical terms. No less than 266,000 sulphonamide tablets, 1,284,000 cascara extract tablets, 2,800,000 aspirin tablets and 11,000,000 "tablets, various" found their way into the L.C.C 's capacious dispensaries, if not into their hungry patients' maws Other staggering figures are 11,400,000 units of insulin, 330,000 c cm. of ethyl chloride, 531,312 corks, 79,096 pairs of surgeons' gloves, 39,315 clinical thermometers, 351,012 X-ray films, 16,897,000 yards of bandage and 1,556,000 sanitary towels. It is pleasing to see that administrative expenses amount to only 1·38 per cent. of the total value of supplies (compared with 1·54 per cent. in 1936-37), while costs of receiving, storing and issuing amounted to 8·27 per cent. (compared with 9 21 per cent. in 1936-37).

INFECTIOUS DISEASE

IN ENGLAND AND WALES DURING THE WEEK ENDED JULY 22, 1939

Notifications—The following cases of infectious disease were notified during the week: Smallpox, 0, scarlet fever, 1925; diphtheria, 870; enteric fever, 21 (59 "expected"); pneumonia (primary or influenzal), 474; puerperal pyrexia, 194; cerebro-spinal fever, 28; acute poliomyelitis, 16; acute polio-encephalitis, 2; encephalitis lethargica, 4, dysentery 30; ophthalmia neonatorum, 92 No case of cholera, plague or typhus fever was notified during the week.

The number of cases in the Infectious Hospitals of the London County Council on July 28 was 2900, which included Scarlet fever, 767, diphtheria, 501 (carriers, 19); measles, 17; whooping cough, 740, puerperal fever, 8 mothers (plus 5 babies); encephalitis lethargica, 306, poliomyelitis, 9 At St Margaret's Hospital there were 19 babies (plus 8 mothers) with ophthalmia neonatorum

Deaths—In 126 great towns, including London, there was no death from smallpox or enteric fever, 2 (0) from measles, 1 (0) from scarlet fever, 8 (2) from whooping-cough, 13 (2) from diphtheria, 36 (11) from diarrhœa and enteritis under two years, and 6 (0) from influenza. The figures in parentheses are those for London itself.

West Ham reported 2 deaths from whooping-cough Fatal cases of diphtheria were scattered over 10 great towns, Croydon and Manchester each reporting 2 Portsmouth and Birmingham each had 4 deaths from diarrhœa

The number of stillbirths notified during the week was 213 (corresponding to a rate of 34 per 1000 total births), including 40 in London

OBITUARY

ARCHIBALD YOUNG

MB, BSC GLASG, FFFPS, FACS, DL, JP

Archibald Young, who died on July 23, aged 65, was for fifteen years professor of surgery in the University of Glasgow In the regius chair he was in the line of Macleod and Macewen, his life was consciously directed to enhance its dignity A gift for teaching was stimulated and developed by a wealth of experience collected in many lands He had a natural affinity for study and maintained to the end a strong and lively interest in the welfare of students, during his tenure of the chair he kept ever before him the advancement of scientific surgery by collaboration with other workers and by fostering in his assistants the spirit of research It was no small achievement for a man of his temperament, for as was well said by the Principal of the university, when accepting Young's portrait a week before his death, he had not been very skilful in the art of compromise There was, the Principal surmised, hardly anyone present in that distinguished gathering who had not been at some time or other Young's opponent And Young himself, in returning thanks, said he could remember the time when members of his hospital staff were barely on speaking terms with one another, he felt he had himself played some part in turning unhealthy rivalry into helpful exchange of views What touched him in his own portrait was a suggestion of kindliness which he did not think his face could ever portray, it was, however, the verdict of his colleagues that, although a bonnie fighter, no one with whom he had been brought into contact had ever been his enemy

Annan, Glasgow

Archibald Young was born in Glasgow on Nov 10, 1873, and was educated at the high school and university where he graduated in science before starting on medicine, his particular interest then being vertebrate anatomy Qualifying in 1895 he held house appointments and took a voyage as ship's doctor before becoming private assistant to Coates in the department of pathology and spending two years as senior assistant to Macewen Then the South African war claimed him as civil surgeon and he found an interest in peripheral nerve injury which never left him His work is published in the official surgical report of that war Twenty-five years later, at the suggestion of the Medical Research Council, he was attached as neurological expert to the Scottish Command at the 4th Scottish General Hospital The results of his war studies were embodied in a paper read to the International Congress of Surgery in 1923 and at the Cairo congress of 1936 he summed up what he had learned of sympathetic surgery Periarterial neurectomy, which had in his hands yielded 65 per cent of successes, had he felt fallen into undeserved neglect Young was optimistic on the uses of ganglionectomy in Raynaud's disease, in Hirschsprung's disease and even in chronic arthritis, although other surgeons failed to verify his success and doubted the ability of periarterial sympathectomy to relieve many types of peripheral pain Young had his own left brachial artery stripped as one step in the treatment of chronic X ray dermatitis with ulceration, the first operation relieved his pain and grafts survived on the ulcers, but further intervention a year later failed in both respects

Young was on the surgical staff of the Western Infirmary for 37 years, he was professor of surgery at Anderson College from 1913 and for many years dean of the college At various times he was president of the Royal Medico Chirurgical Society of Glasgow, of the Association of Surgeons of Great Britain and Ireland and of the Royal Faculty of Physicians and Surgeons of Glasgow Many foreign distinctions fell to him, he was one of the few foreign members of the Royal Academy of Physicians in Rome and his intimate knowledge of Italian and French brought him many contacts not only with the work of foreign surgeons but with the surgeons themselves At Strasbourg, whose university made him an honorary graduate, he was a familiar figure Lately he had completed a translation of Leriche's "Surgery of Pain"

Professor Leriche writes "Le stoïcisme discret d'une fin douloureuse, qu'il a vu venir de face, a clairement montré l'exceptionnelle hauteur morale de cet homme loyal et droit, qui fut un travailleur obstiné, de cet homme de caractère qui cachait sous une apparente réserve, parfois ironique, une fine sensibilité et un grand charme d'esprit Le 2 juillet, il m'écrivait son diagnostic impitoyable 'J'ai été heureux,' ajoutait-il, 'd'avoir pu tenir jusqu'au bout de l'année universitaire I have managed to keep the flag flying Je suis résigné et vous fais mes adieux' Ses dernières semaines doivent rester pour nous tous un exemple et une leçon

"Le chirurgien chez lui ne pouvait pas être séparé de l'homme Il était personnel, consciencieux, probe, sincère avec lui même et avec les autres L'opérateur était net et précis, mesuré et décidé Il avait participé à deux guerres Il s'était intéressé aux blessures des nerfs Il avait vu souffrir Il avait souffert lui même Ses pauvres doigts mutilés avaient bénéficié d'une opération décriée Dès lors, il vous le meilleur de lui même au problème de la douleur et à la chirurgie du sympathique

"Bien qu'il fut mon aîné, il avait voulu un jour venir voir mes opérés anciens et récents, désireux de fortifier sa documentation écrite Nous vécûmes ensemble quelques jours de pleine compréhension et, peu après en 1931, dans un mémoire remarqué il prit fait et cause pour la sympathectomie périartérielle, rejetée par beaucoup comme une erreur physiologique à coup sûr inefficace malgré tant de succès obtenus à peu de frais Cette sincérité objective qui ne s'embarrasse pas de la théorie était une des caractéristiques de son esprit Aussi en 1936, au Congrès International du Caire devra-t-il brusquement un débat officiellement limité et jeta dans la discussion sur la base de 72 observations personnelles tous les procédés de la chirurgie du sympathique Sa contribution d'alors à l'étude comparée de la sympathectomie périartérielle et des ganglionectomies demeure une des plus décisives qui soit survenue objective dans la ligne étroite des faits d'observation

"Le thème de la douleur le passionnait de plus en

plus Il en avait compris la haute portée sociale et la valeur de renouvellement pour la médecine entière. Aussi, quand, en 1937, parut un livre sur la chirurgie de la douleur, qui s'efforçait à une synthèse, il demanda aussitôt le privilège d'en faire la traduction. La tâche était rude, ingrate Bien que souffrant déjà lui-même, il se mit au travail avec une ardeur juvénile. Avec une conscience scrupuleuse, il s'ingénia à surmonter toutes les difficultés d'une pensée parfois abstraite, d'une langue concise et personnelle, souvent intraduisible Il retournait les idées et les mots comme il eut fait des symptômes dans un diagnostic hésitant, jusqu'à ce qu'il fut assuré de ne rien trahir Un an après, son livre paraissait. Il eut la grande joie de le voir bien accueilli, conscient d'avoir fait une oeuvre utile pour ses frères en douleur.

"Il voulait poursuivre cette étude de la douleur. Hélas, comme il le disait, avec un humour amer, le 17 juillet, alors qu'on lui remettait le beau portrait que James Gunn a fait de lui : 'One is more or less sure of today ; one is less sure of tomorrow.'

"Pour moi, qu'une amitié profonde, qu'une vraie fraternité intellectuelle unissait à Archibald Young, je veux lui dire, avec mon cordial adieu, un remercîement ému pour l'aide qu'il m'a apportée dans la diffusion des idées aux-quelles j'ai consacré ma vie, en sachant être, lui qui était un Maître, le meilleur des collaborateurs"

Professor Young married in 1911 Anna Stuart and leaves his widow with two sons, one of whom has recently graduated in medicine at Glasgow.

ROBERT WILLIAM REID

M D., LL D ABERD., F.R.C S

Professor Reid, who occupied the regius chair of anatomy in the University of Aberdeen for thirty-six years, died on Friday of last week

He was born at the manse of Auchindoir, Aberdeenshire, in 1851, being the second son of the Rev. William Reid, minister of that parish He studied at Aberdeen University, graduating as M B. in 1872 and M D three years later; in 1881 he became a Fellow of the Royal College of Surgeons of England. He began his career as an anatomist in his alma mater by acting as assistant for a year to Sir John Struthers Thereafter, at the early age of 22, he was appointed demonstrator at St. Thomas's Hospital medical school, London, where he became lecturer in anatomy in 1877. One of the first whole-time anatomists in the London medical schools, he not only reorganised the anatomy department at St. Thomas's but found time for pioneer research upon the topography of the brain, and to THE LANCET of Sept 27, 1884, he contributed Observations on the Relation of the Principal Fissures and Convolutions of the Cerebrum to the Outer Surface of the Scalp—a paper describing and illustrating what has since been called Reid's base line To his work as anatomist he added the duties of vice-dean of the medical school In 1887, when the Anatomical Society of Great Britain and Ireland was founded, he became one of its original members, being elected to its first council and later he filled with distinction the office of president

MacMahon

Reid was appointed regius professor of anatomy at Aberdeen in 1889. With characteristic energy he planned and obtained new rooms for practical work and research, and refurnished the museum to serve teaching purposes. As a fellow of the Royal Anthropological Institute of Great Britain and Ireland he was particularly interested in anthropology, and he set up an anthropometric laboratory where physical characteristics of students were systematically recorded Three important papers based on the data thus obtained were published in collaboration with J. H Mulligan in the *Journal of the Royal Anthropological Institute.* His inception and elaboration of the anthropological museum in the Marischal College at Aberdeen, to which he devoted much time in his retirement, is a remarkable and enduring monument to his memory Amid innumerable objects of interest, carefully catalogued by Reid himself, the museum contains many of his own finds as an investigator of the inhabitants (both prehistoric and modern) of north-east Scotland He cared about the living as well as the dead, and gave useful public lectures on the structure and care of the body. A lectureship in anthropology in the university already bears his name

Reid took a large part in university administration, as dean of the medical faculty, member of the university court, and representative on the General Medical Council from 1896 to 1901. Former students will recall not only his qualities as a teacher, but one who had ever a keen and kindly interest in their welfare. He was a disciplinarian but was just and considerate. He remembered his old pupils long after they left him, and he was known for his helpfulness towards medical students who came from abroad He never married, but his house in Albyn Place, where his sister looked after him till her death six months ago, had an ever-open door.

Professor Reid's elder brother was the late Major General Sir Alexander Reid, the younger was William Reid, medical superintendent of the Aberdeen Royal Asylum.

GEORGE C. M. M'GONIGLE

M D , D.HY DURH., D P H

Dr. M'Gonigle died on Sunday last, aged 51, at Stockton-on-Tees, where he was medical officer of health. He had spent his life in the public-health service and it was natural that in an area where problems of nutrition had been so urgent since the decline of local industries his reports were increasingly full of expedients for the relief of malnutrition Early in 1933 he leapt into notice with a paper read at the Royal Society of Medicine on the strange results of removing a slum population Six years before, some 150 families had been evacuated from the Housewife Lane area, which consisted largely of one-room tenements of bad structure and hygiene, to model houses on the Mount Pleasant estate which seemed to offer everything that sanitary science could demand Nevertheless this subliminated slum population was demonstrably less healthy than a similar population in the Riverside area which remained in its depressed conditions. Many forms of disease contributed to the increased death-rate,

measles cancer, heart conditions, bronchitis and pneumonia predominating This preliminary survey was followed in 1936 by a book, entitled "Poverty and Health" (in collaboration with J Kirby), in which he discussed the lessons of a population removed from a slum area to a new housing estate, when the increased rent reduced the margin available for food Statistically the samples were small but M'Gonigle's knowledge of local conditions and his ability to analyse the expenditure of the poor justified him in assigning to the shortage of protein the blame for such a large (he calculated it as a fourfold) increase on the expected death rate

M'Gonigle was born and remained a Northumbrian The only son of Canon M'Gonigle, formerly vicar of Ellingham, he qualified at Newcastle in 1910 and held resident posts there and at Sunderland before going to Rampton where he became deputy superintendent After serving five years in the war, mostly in France and Italy, he returned to enter the school medical service

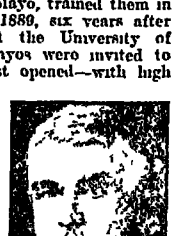
Dr J A Charles writes At the Royal Victoria Infirmary, Newcastle, M'Gonigle was house surgeon to Rutherford Morison At a comparatively early stage in his career he took the diploma in public health, and entered the public health service as a member of the staff of the Durham county health department Whatever may have influenced him in taking this step, whether the family association with local government, for his father, Canon M'Gonigle was for many years a member of the Northumberland county council, or the realisation that for the biologically minded public health offered unexplored opportunities, it was a decision of no little importance to preventive medicine in this country After a short period with the Durham authority, M'Gonigle became medical officer of health of Stockton on Tees, in 1924 In this borough where he was both in word and fact a general practitioner of public health, carrying out all the duties of his office with one medical assistant he spent the remainder of his life Other men, with smaller gifts of mind, have travelled further, but M'Gonigle set aside all his disappointments, and they were many, to immerse himself in the problems of distress and poverty which for many years were outstanding in the life of Stockton He tackled one question after another—rickets dental caries, the nutrition of the rehoused slum dweller—mastering his techniques as he went along, and everything he touched he stripped a little nearer to the central truth There can have been but few more industrious field workers and none more modest or diffident in discussing his achievements, or more helpful to those of his colleagues in the service who looked to him for guidance and inspiration The tributes which most delighted him were invitations to extend the range of his activities and inquiries and requests for his coöperation on department al and other public committees To all of these he contributed abundantly and they compensated him for the preferment which he deserved so richly but never obtained

But apart from his absorption in social medicine M'Gonigle had other interests His friends recognised him as a wise counsellor and elected him to offices in the Society of Medical Officers of Health and the B M A He helped to reorganise his old medical school of which for many years he was a governor To those who knew M'Gonigle only as a recorder of his researches in clear and simple English his real eloquence as a speaker came as a surprise and he was in frequent demand on public platforms throughout the North of England An old infantile paralysis had left him slightly lame, but it also made him the constant friend of every cripple and every handicapped child He was a keen fisherman and his disability did not prevent him from becoming an expert and lively swimmer His early life in a Northumberland parish gave him a love for both the sea and the countryside That in recent years he overtaxed his strength there can be no question, but his restless and inquiring mind was never content to be idle Time was somehow found for new work or to give ungrudgingly and gladly to others the help for which they sought His great characteristics were courage, honesty of purpose, friendliness and loyalty An eager and fascinating spirit has left us, but his work and example will remain

WILLIAM J MAYO

M D, D SC, LL D, I A C S, F R C S

William Mayo, who died on July 28 at the age of 78, was the elder of the brothers who founded the Mayo Clinic at Rochester, Minnesota On the death of Charles Mayo two months ago we gave some account of their origin and early years, and told how their father, William Worrall Mayo, trained them in general practice It was in 1889, six years after William junior graduated at the University of Minnesota, that the three Mayos were invited to staff St Mary's Hospital just opened—with high hopes but few beds—by sisters of the Order of St Francis Two years later W J, as he was called, made the first of his 690 contributions to medical literature, but it was not until the turn of the century that the work of the little Rochester hospital began to be known elsewhere The story goes that William then sent a paper to the *Annals of Surgery* recording so many cases of gall stones treated so successfully that the editor could scarcely believe it, and went to see for himself He was the first of a stream of visitors that has never ceased since From that time W J had in mind the idea of a great clinic or medical centre where group medicine could be practised with its fullest effect In working out this idea his brother Charles was the first and foremost of his collaborators, but it was William who created it and surmounted all difficulties until it bore fruit He lived to see it flourish abundantly, and the brothers Mayo have died with the satisfaction of knowing that their organisation, like many of their ideas, is seemely established and will work without them



After going to Rochester in 1906 Prof Grey Turner wrote "Wherever you travel among surgeons in America you are asked 'Have you seen the Mayos?' and everyone seems either to have been at Rochester or to be going Weir of New York, speaking of the Mayos at the British Medical Association meeting in Toronto, said that for big game his countrymen always looked to the North west, and it was the same in surgery The Mayos were the doctors surgeons and when doctors went to be operated upon in Rochester they always took return tickets" On this first visit Prof Grey Turner was impressed by the rational arrangements, the brothers recognised that "method is the harness without which only the horses of genius travel He noted with

interest the presence of a (well-paid) pathologist at every operation, and the administration of anæsthetics by women; and he admired the Mayos' kindness to visitors, their desire to further the science and art of surgery, their devotion to one another, their industry, their simple technique, and their excellent results At that time, thirty-three years ago, they had already performed partial gastrectomy in 150 cases of cancer of the stomach with a mortality of only 10 per cent. and a three-year survival-rate of nearly 30 per cent; indeed in 1906 they had 36 cases with but 1 death. William Mayo had no use for "the hopeless gastro-enterostomy which enables the patient to live longer and suffer more." With such statistics, said the onlooker, the physician living within travelling distance of the Mayos had no choice but to send them his patients; "and I only wish that our young physicians would with their own eyes go and see what things may be."

At that time the elder Mayo was dreaming of great schemes for improving surgical education and not long afterwards the Mayo Foundation came into being, by which men are enabled to go to the clinic for three years' sustained study, receiving not only their keep but also substantial allowances Rarely can the subject of an obituary speak for himself, but the following extracts from a letter accompanying a large gift to the University of Minnesota reflect the sincerity, purpose, and fidelity of the writer:—

"Our father recognised certain definite social obligations. He believed that any man who had better opportunity than others, greater strength of mind, body, or character, owed something to those who had not been so provided; that is, that the important thing in life is not to accomplish for one's self alone, but for each to carry his share of collective responsibility. Stepping as we did into a large general practice, with a great deal of surgery from the beginning, my brother and I had an exceptional opportunity, and as we entered medical practice during the early period of development of asepsis and antisepsis in surgery which had come through the work of Pasteur and Lister, this opportunity was unique. We were especially fortunate that we had the benefit of our father's large experience to help us apply the modern methods to replace the old type of surgery which up to that time had been practised. There being two of us, with absolute mutual confidence, each of us was able to travel at home and abroad each year for definite periods of study of subjects connected with surgery, as well as to attend medical meetings, while the other was at home carrying on the practice.

"In 1894, having paid for our homes and started a modest life insurance programme, we decided upon a plan whereby we could eventually do something worth while for the sick This plan was to put aside from our earnings any sum in excess of what might be called a reasonable return for the work we accomplished. It seemed to us then, as now, that moneys which should accumulate over and above the amount necessary for a living under circumstances which would give favourable conditions to work and to prepare reasonably for our families, would interfere seriously with the object that we had in view.

"Contented industry is the mainspring of human happiness. Money is so likely to encourage waste of time, changing of objectives in life, living under circumstances which put one out of touch with those who have been lifelong friends, who perhaps have been less fortunate. How many families have we seen ruined by money which has taken away from the younger members the desire to labour and achieve and has introduced elements into their lives whereby, instead of being useful citizens, they have become wasteful and sometimes profligate.

"Medicine constantly became more complex From time to time new members were added to the staff. Each member of the staff received a salary which was sufficient to permit wholehearted attention to his work. There was no profit-sharing—accumulations over and above the amount necessary for the purposes I have outlined were conservatively invested, and have been reinvested, adding all interest to principal.

"Year by year more young physicians applied for positions as assistants and internes in the hospitals. The need of providing in some way a better form of postgraduate medical education for these earnest young men soon became apparent. . . .

"The fund which we had built up and which had grown far beyond our expectations had come from the sick, and we believed that it ought to return to the sick in the form of advanced medical education, which would develop better trained physicians, and to research to reduce the amount of sickness. My brother and I came to the conclusion that this purpose could be best accomplished through the state university.

"In 1913, when our fund seemed to be of sufficient size to warrant the endowment of a foundation at the University of Minnesota to carry out these purposes, we proposed the affiliation After careful consideration, the arrangements were agreed upon June 9, 1913 My brother and I gave to the University of Minnesota a million and a half dollars, which was the entire fund which we had been able to accumulate up to that time, to found the Mayo Foundation for Medical Education and Research, with the understanding that the sum should reach two millions or more before any part of the income should be expended. . . .

"Nineteen years have gone by since the Mayo Foundation for Medical Education and Research was established. The association between the University and the Foundation at Rochester has been most harmonious, and has been distinguished by splendid cooperation on both sides for the benefit of higher medical education and research. The people's money, of which we have been the moral custodians, is being irrevocably returned to the people from whom it came."

Here then is the mature yet unpretentious philosophy upon which the Mayo Clinic has grown and prospered Its development and work have become phenomenal The clinic itself is now so many stories high that it has to be surmounted by a red light on the roof lest it be struck by planes on the Chicago-Minneapolis route But besides the clinic there are many other additions like the hospital floors in the Hotel Kahler, the institute of experimental surgery, the museum on the site of the school where William learnt the rudiments, the hospital laundries, and a host of other activities incidental to what is really a town devoted to healing

But Dr Will was always on the alert to foster the cultural side of the organisation; the record department with its hundred clerks, and the well-stocked library with its study rooms, are examples Staff meetings of all sorts became a regular feature, assistants were encouraged to write for the *Proceedings*, and Mayo himself produced large numbers of valuable papers recording his huge experience in many branches of surgery, especially on the stomach, the intestines and the biliary tract. Their breadth and range can scarcely have been equalled.

In his active professional life of 56 years he became America's most celebrated surgeon, honoured with degrees from twenty-seven universities in twenty different countries. In an age of giants, writes Mr. A H McIndoe, this man stood head and shoulders above the rest, and it is probable the world will never see his like again. His powers of concentration and his iron constitution made him a natural leader, and beginning his career at a time when Lister's principle had been firmly established he

helped in the growth of modern surgery in a community whose economic expansion was just as swift

Prof Grey Turner puts it like this "It has been said that William Mayo was a great administrative surgeon, and that was certainly true He was a man of wide outlook and big ideas who would have shone in big business of any sort But he was also a great doctor and a fine surgeon whose principal ambition was to heal the sick and to give a fairer deal to the patient In all he did he was absolutely honest and I have never known anyone more ready to acknowledge a mistake In many ways he was a giant, but withal a man of simple tastes and small personal ambition who loved his fellow men and the profession which enabled him to serve them."

Dr William Mayo married in 1884 Hattie M Damon, and she survives him One of his two daughters is the wife of Dr Donald Balfour

FRANKLEN FRANKLEN-EVANS
M D CAMB, D P H

Dr Franklen Evans, who died at Buxton on July 26 at the age of 70, was for many years associated with the Devonshire Royal Hospital there The second son of Franklen George Evans, J P, of Llwynarthen, near Cardiff, he studied chemistry at University College, Bristol, and was exhibitioner at St John's College, Cambridge, before going on to clinical work at St George's and University College, London His appointment in 1912 as bacteriologist and radiologist to the Buxton hospital gave him the facilities he desired to continue the study of rheumatoid arthritis begun with Strangeways at Cambridge He was one of the earliest workers in the vaccine treatment of arthritis and had great confidence in a strain of streptococci which he isolated by cultural methods of his own His clinical colleagues certainly saw good results from its employment, but, although he made extensive notes and must have accumulated masses of records, Franklen Evans did not communicate them either to his colleagues or to any learned society After resigning his appointment in 1924 he married as his second wife one of the hospital sisters and continued to work privately as a bacteriologist Outside his work he had many interests, ranging from old music to geological specimens about which he talked with enthusiasm once the ice was broken

JENNER AND NAPOLEON

"Jenner! Ah, to that man we can refuse nothing," said Napoleon The story is a tribute both to Jenner's fame and to the Emperor's enlightenment It was the immediate response to Jenner's petition for the release of two of his friends from detention as prisoners-of-war Prof J A Nixon in a delightful little essay (*Proc R Soc Med* June, 1939, p 877) has given us the details not only of this event but of the many other efforts made by Jenner to secure the release of prisoners-of war both in France and Spain during the unhappy period that followed the demise of the peace of Amiens Such was Jenner's fame that, says Professor Nixon, "English travellers left our shores not with a passport signed by a minister of state, but with a simple certificate bearing the name of Edward Jenner" In recording these examples of Jenner's successful, and sometimes unsuccessful, intervention, Professor Nixon reminds us of the honourable tradition of our profession that science knows no national boundaries but he omits to point out what seems so remarkable and at the same time creditable to science generally, that Jenner leapt into world wide fame in less than ten years from the first publication of his researches

Appointments

BELLINGHAM, ROGER M B Edin, resident surgical officer at the Royal Salop Infirmary, Shrewsbury

BREWER, J K, M B Cape Town F R C S, resident assistant medical officer at the County Hospital, Kingston-on Thames

BROWN, Q S, M B Edin F R C S E M R C O G, hon gynæcologist to the Hull Royal Infirmary

BURCH, JACQUELINE V, M R C S, resident assistant medical officer at the Maternity Hospital Dewsbury

CORFIELD, CHARLES, M D Durh, hon and consulting anæsthetist to the Bristol General Hospital

CRAIG W J, M B Dubl, D M R E, hon radiologist to the East Ham Memorial Hospital

FRASER PHYLLIS M FARNCOMBE, M B Lond, D M R assistant radiologist to the South London Hospital for Women

GREENER, JOAN E, M B Birm, D P H, D P M medical officer to the Mental Deficiency Act Committee for Birmingham

HANDLEY, R S, M B Camb, F R C S, surgical registrar at the Middlesex Hospital London

HIGHET W B, M B N Z F R C S resident medical officer at the Royal Cancer Hospital (Free), London

HUGHES, T LLOYD, M D Lpool, D P H barrister at law, medical officer of health for Bebington and medical superintendent of the Wirral Joint Isolation Hospital.

LANCKNAU, NELLIE I, M D Lond, medical officer in charge of the electrotherapeutic department of St Mary's Hospital, London

LAWSON R P F R C S E D L O L D S R C S hon assistant laryngologist to the Hospital for Consumption Manchester

LEYSHON, V N, M D Lond, D P H, deputy medical officer of health for Dewsbury

LIGHTWOOD, REGINALD, M D Lond F R C P D P H, physician to the department for diseases of children at St Mary's Hospital London.

MCALLUM MIRIAM E, M B Glasg, M M S A assistant medical officer for maternity and child welfare for Preston

MAXWELL E, M D Belf, D M R E assistant to the radiological department of the Royal Infirmary Gloucester

MOORE G A, M S Lond, M Ch Brist, F R C S, hon and consulting surgeon to the Bristol General Hospital

MOORE LEONARD, M B Brist, hon and consulting anæsthetist to the Bristol Royal Infirmary

PEPPER ELIZABETH M B, Lond, D M R E, radiologist to the South London Hospital for Women

PILE, G C L, M B Camb, F R C S, surgical registrar at the Middlesex Hospital, London

ROSE K W L D S Birm assistant school dentist for Nottingham

RUBIN JACK, M B Cape Town F R C S F resident surgical officer at the Royal Hampshire County Hospital Winchester

TAYLOR, N S, M B Lpool assistant medical officer in the venereal diseases treatment centre Salford

THOMSON JAMES, M B, resident medical officer at the Isolation Hospital, Heine Thanet

WILSON, A J, M D Edin, M R C P E, visiting consulting physician to Nuneaton General Hospital

Middlesex County Council—The following appointments are announced:—

CASTLEDEN, L I M, M D Lond, M R C P physician (grade II) at the Redhill County Hospital, Edgware.

COOKEY F S, M D Lond visiting electrotherapist at the Redhill County Hospital, Edgware

HANLEY H G M D Lpool F R C S assistant medical officer at Hillingdon County Hospital Uxbridge

ROGERSON, KATHARINE C, M R C S, assistant medical officer at the West Middlesex County Hospital Isleworth

MURPHY MARY G, M B Lond junior assistant medical officer at the North Middlesex County Hospital Edmonton, and

FOUCHEUX, M B Sydney, junior assistant medical officer at the North Middlesex County Hospital Edmonton.

National Dental Hospital, London—The following appointments are announced:—

HALLON, DOUGLAS, M R C S, L D S R C S hon assistant dental surgeon;

GREEN C DE VERE L D S R C S, D D S Toronto hon assistant dental surgeon and

SCHOFIELD JAMES, M R C S L D S R C S, hon assistant dental surgeon

St Paul's Hospital, London—The following appointments are announced:—

CATTLIN, G T, M D Camb, D M R E radiologist

HANLET, H G M D Lpool, F R C S hon urological and registrar

UNDERWOOD, W E, M B Camb F R C S assistant surgeon

HUMPLE J E M D Camb F R C S, assistant surgeon and HIGHAM, A R C S M B Lond F R C S, assistant surgeon.

Bristol Royal Infirmary and the Bristol General Hospital (Amalgamated)—The following appointments are announced:—

CAPPER W MELVILLE M B Lond, F R C S, M R C O G hon assistant obstetrician

BRADSHAW, F G M R C S, D A, hon anæsthetist, and

LOGAN R B M R C S, D A, hon anæsthetic

Vacancies

Anglesey County Council —Asst county M O H , £600
Argyll, Argyll and Bute District Mental Hosp —J A M O , £350.
Ashton-under-Lyne, Lake Hosp —Res obstet O , £350
Barrow-in-Furness County Borough —Asst M O H , £500
Beckenham Hosp ,—Res M O , at rate of £150
Bedford County Hosp —First and second H S , at rate of £155 and £150 respectively
Birmingham, Monyhull Colony Mental Deficiency Institution —Med supt , £1000
Birmingham University —Lecturer in physiological dept , £400
Bootle General Hosp —H S to spec depts , at rate of £150
Bradford, Municipal General Hosp —H P 's and H S 's, each at rate of £150
Bristol Royal Infirmary —Sen res M O , £200
Bury County Borough —Deputy M O H , £750
Cardiff, King Edward VII Welsh National Memorial Association. Three half-time asst. tuberculosis O 's, each £250
Carlisle, Cumberland Infirmary —Res surg O , £250 Also H P , H S , and H S to spec depts , each at rate of £160
Colchester, Royal Eastern Counties' Institution, &c —Med supt for Bridge Home, Witham, £750
Devon County Council —Asst county M O.H and district M O H , £800.
Dover, Royal Victoria Hosp —Two R M O 's, each £140
Dudley, Guest Hosp —Res surg O , at rate of £250–£300. Also H S , £150
Durham County and Sunderland Eye Infirmary —H S , £350
Durham County Council and Seaham Urban District Council —Asst school M O and M O H , £800
East Ham Memorial Hosp , Shrewsbury Road, E 7 —H P., at rate of £150
Edinburgh, Royal College of Physicians —Bacteriologist, £700
Elizabeth Garrett Anderson Hosp , Euston Road, N W 1 — Clin assistantships in gynæcological out-patient dept
Essex County —Temp M O for casualty services, £600.
Huddersfield Royal Infirmary —Cas O , at rate of £200.
Hull, Anlaby Road Institution —Asst M O , £350
Industrial Welfare Society, 14, Hobart Place, S W 1 —Industrial medical officers
King Edward Memorial Hosp , Matlock Lane, Ealing, W 13 — Cas O and H S , at rate of £150
Lancaster, Royal Albert Institution for the Feeble-Minded —Res jun M O , £425
Leeds, Killingbeck Sanatorium —Asst res M O , £250
Leicester City General Hosp —Res M O , at rate of £300
Liphook, Hants, King George's Sanatorium for Sailors —Asst M O , at rate of £200
Liverpool, County Mental Hosp , Rainhill —Asst M O , locum tenens, 8 guineas a week
Liverpool, Fazakerley Sanatorium —Med supt , £750 Also res asst M O , £250
Liverpool University and Liverpool Maternity Hosp —Obstet asst and tutor, £250
London Chest Hosp , Victoria Park, E 2 —H P , at rate of £100.
London Hosp , E 1 —Sen res O , £400 Also clin asst in X-ray dept , £35
London University —Chair of chemistry at Royal Cancer Hosp £1000
Luton Borough —Pathologist and bacteriologist, £650
Manchester, Christie Hosp and Holt Radium Institute —Asst M O , £400 Also two clinical assistantships
Manchester, Crumpsall Hosp —Res asst M O , at rate of £200
Manchester, Duchess of York Hosp for Babies —Jun res M O , at rate of £75
Manchester, Park Hosp , Davyhulme —Res. obstet officer, £400
Manchester, Saint Mary's Hosps —Res obstet O for Whitworth Street Hosp , £150 Asst res obstet O for Whitworth Street Hosp and jun res anæsthetist, each at rate of £100
Manchester City —Res anæsthetists for Crumpsall and Withington Hosp , each at rate of £250
Manchester Royal Infirmary —Res M O , £200
Mansfield and District General Hosp —Res surg O , £250 Also H S , at rate of £150
Mexborough, Montague Hosp —Res surg O , £400
Miller General Hosp , Greenwich Road, S E 10 —H P and H S , each at rate of £100
Newcastle-upon-Tyne Hosp for Sick Children —H P and two H S 's, each at rate of £100
Norwich, Norfolk and Norwich Hosp —Hon dermatologist
Prescot, Whiston County Hosp —Sen res M O , £400
Preston, County Mental Hosp , Whittingham —Deputy med supt , £800
Reading, Royal Berkshire Hosp —Res M O , at Blagrave Branch Hosp and asst to pathologist (combined post), at rate of £150
Rochdale Infirmary and Dispensary —Second H S , £150
Rotherham County Borough —Asst M O H , £600
Royal Naval Dental Service —Dental officers
Royal Naval Medical Service —Medical officers
St Bartholomew's Hosp , E C 1 —Dental H S , £80
St Mary's Hosp , W 2 —Jun asst radiologist, at rate of £75
St Thomas's Hosp , S E 1 —Temp res asst physician, at rate of £225
Southampton, Royal South Hants and Southampton Hosp —Sen H S , £200 Also res anæsthetist and H S to general surgical and ear, nose and throat wards, each at rate of £150
Southampton County Borough —Asst M O H , £500
Sutton Sutton and Cheam Hosp —Jun res M O at rate of £100
Swansea County Borough —Asst M.O , £500
Torquay Borough —Deputy M O H and asst school M O , £600
University College Hosp , Gower Street, W C 1 —Sen asst radiologist, £250.
Walsall General Hosp —Cas H S , at rate of £150.

Births, Marriages and Deaths

BIRTHS

GLEAVE —On July 28, at Cherat, N W.F P , India, the wife of Captain Alfred Gleave, R A M C —a daughter

GORDON —On July 29, the wife of Dr C J Gordon, of Gloucester Place, London, N W 1—a daughter

HONEYWILL —On July 30, at University College Hospital, the wife of Mr L J Honeywill, F R C S —a daughter.

PANK —On July 27, at Srinagar, Kashmir, the wife of Major P E D Pank, R A M C —a daughter

PEERS —On July 23, at Nuffield House, Guy's Hospital, the wife of Dr Anthony Peers—a son

PREWER —On July 28, the wife of Dr R Russell Prewer, of Broadmoor, Crowthorne, Berks—a son.

PROPERT —On July 28, at Colchester, the wife of Dr S A Propert—a daughter

ROGERS —On July 28, the wife of Dr Keith B Rogers—a daughter

MARRIAGES

HARRISON—MARRYAT —*On July 29, at St Matthias Church*, Richmond, Surrey, George Kent Harrison, M D , F R C S, to Mary Marryat

TAYLOR—JARDINE —On July 27, at St Andrew's, Thomas Murray Taylor, advocate, professor of law in the University of Aberdeen, to Helen Margaret Jardine, M D , of Leyton

DEATHS

AIKIN —On July 26, at 66, Bedford Gardens, London, W 8, William Arthur Aikin, M D Brussels, M R C S , aged 82

ATKINSON —On July 26, at Tyrrellspass House, Sybil Atkinson, L R C P I

CHARLESWORTH —On July 27, at 177, Old Brompton Road, London, S W 5, Francis Charlesworth, M B Edin , late of Zanzibar

FAUSSET-FARQUHAR —At Aberdeen, Andrew Grierson Fausset-Farquhar, M B

FRANKLEN-EVANS —On July 26, in Buxton, Franklin Paine Franklen-Evans, M D Camb , D P H , aged 76

JENNER CLARKE —On July 29, in Exmouth, William Jenner Clarke, M R C S , late of Newbury, Berks

M'GONIGLE —On July 30, at Norton-on-Tees, George Cuthbert Mura M'Gonigle, M D , D.Hy Durh , D P H , medical officer of health for Stockton-on-Tees

OGLE —On July 25, at 223, Randolph Avenue, London, W 9, Charles John Ogle, M R C S , in his 84th year

POWER —On July 25, at Berkhamsted, Herts, Henry D'Arcy Power, L R C P I , L S A., late professor of pathology, San Francisco, aged 82

REID —On July 28, at Aberdeen, Robert William Reid, M.D Aberd , L L D , F R C S , emeritus regius professor of anatomy in the University of Aberdeen

SAMPSON —On July 28, Henry Moore Sampson, M R C S , formerly of Painswick, Gloucestershire, and late of Upper Tooting, aged 86

WILLIAMS —On July 23, at Much Birch, Hereford, Edward Cecil Williams, M B Camb , M R C P , formerly of Clifton, Bristol

N B —A fee of 7s. 6d is charged for the announcement of Births, Marriages, and Deaths

HEART OF OAK

WRITING in a racy and conversational style, Dr. I G. BRIGGS recounts his adventures on land and sea in a book which touches on places as far apart as Rangoon, Australia and the Amazon. (The Surgeon Goes to Sea. London: Longmans Green & Co. 1939. Pp. 269. 10*s.* 6*d.*) Interspersed with these reminiscences of travel are anecdotes about practice ashore; about the patients and situations that have come his way; and about his methods of coping with them. He is a keen observer of what goes on around him, and a skilled hand at committing it to paper. Especially good is his sketch of Singapore, which recalls Kipling in its sophistication and economy of language. Though he seems, as a rule, to be a breezy and kindly doctor, he is less concerned than most when his patients seek other advice Whilst admiring his sturdy independence it may be wondered whether a little more tact and a little less downright and brutal truthfulness might not sometimes have achieved more for his patients.

NOTES, COMMENTS, AND ABSTRACTS

PHYSICAL METHODS IN RHEUMATIC DISEASE

In the hope that it may be useful to the medical profession the Empire Rheumatism Council has circulated a report, prepared for its scientific advisory committee by Sir LEONARD HILL, F R S and Mr H J TAYLOR, Ph D We reproduce it in full —

INTRODUCTORY

Proclaimed as of value in the physical treatment of rheumatic disease, there are several forms of apparatus offered to the public Some of these are advertised to the medical profession only, others are advertised to the general community

It is obviously important that these apparatus should be submitted to accurate scientific investigation Some may be altogether useless Others, whilst being in a measure useful, may make claims to have effects which cannot be justified Yet others are questionable from an economic point of view, since the effects which they produce can, by other means, be gained more simply and at a less cost In regard to this last category some consideration should perhaps fairly be given to what may be termed the psychotherapeutic factor If some apparatus which will secure a good effect but at a higher cost than a simpler means can inspire a special degree of faith in the patient, there is no great harm done except to the purse of the purchaser, provided, of course, that no false claims are made, and that the extra charge on "faith healing" account is not unduly excessive That consideration has been kept in mind during the investigation we have made of various claims

The following facts are submitted to members of the medical profession in the hope that they will be of use when they are called upon to prescribe apparatus for rheumatic patients On the general public it cannot be too strongly urged that it is dangerous to employ electrical or other apparatus except on medical advice and under proper supervision

ULTRAVIOLET RADIATION

The active ultraviolet rays which produce sunburn in the skin are the shortest in the sun's spectrum, 0 3 μ Still shorter rays are produced by arc lamps, but these have little power of penetration and such activity as they have on the skin is not different to that of the ultraviolet rays The active ultraviolet rays scarcely penetrate beyond the epidermis, and they affect primarily the living epidermic cells which they damage The inflammatory reaction of sunburn ensues after a latent period owing to the presence of damaged cell products Vitamin D is also produced by the action of these rays on ergosterol in the skin

The iron cored carbon arc in an arc lamp is efficient and is cheaper to run than the tungsten arc The addition of a small quantity of titanium to the tungsten arc does not make any difference to the ultraviolet output of that arc The contrary has been claimed The price of mercury vapour lamps is reasonable, but the charge for stand and reflector usually increases the total cost out of all proportion to their value The artificial sources of light rays produce in truth mainly infrared rays, less than 10 per cent of the radiation being visible light

There is no evidence of the value of different coloured lights other than that of suggestion

INFRARED RADIATION AND OTHER SOURCES OF HEAT

Water in a layer 1 cm thick is opaque to radiation of longer wave length than 1 4 μ. A piece of rat skin 0 41 mm thick absorbs all radiation of longer wave length than 3 μ and partially radiation between 2 μ and 3 μ A dark source of heat which gives all or nearly all its radiation in the form of wave lengths longer than 2 μ can therefore have only a surface heating effect, it cannot penetrate the skin As in the case of a hot-water bath or a hot fomentation heat is conducted in and carried away by the blood circulating in the derma It is therefore unjustifiable to claim that dark sources emit rays of great penetrating power, and an ordinary domestic electric fire may be as good as a "dark heater" sold for treatment purposes at a far higher price For example as compared with an apparatus consisting of a heating coil and reflector costing, say, from 8 to 12 guineas an equally effective piece of apparatus in the shape of a bowl fire can be purchased for from 15s to £1 Red rays and the short infrared rays penetrate through the skin to the greatest depth

Visible rays other than red on penetrating the epidermis are absorbed in the blood of the derma Incandescent lamps are the best sources of the most penetrating rays When a glow lamp is placed in the mouth about 10 per cent of the rays penetrate the cheek, 5 mm thick, of a white man, no rays penetrate the cheek of a negro

The modern gas fire with bright radiants is one source of the more penetrating rays These rays excite flushing and transudation and are more comfortable than rays which heat the surface only It is claimed that the penetrating rays heat tissue under the epidermis more than they heat the surface

The flushing, increased flow of lymph and softening of tissue produced by heat, their analgesic effect and their heightening of tissue metabolism are of great value, and can be obtained by simple inexpensive means such as baths, fomentations and radiant heaters For deep heating the ultra high frequency current can be used This has no specific effect other than heat Low energy high frequency apparatus does not heat, therefore it has no effect other than that due to suggestion, although claims are made to the contrary by salesmen of various apparatus

MILD RADIO ACTIVITY

There is no trustworthy scientific evidence of any biological effect of weak radium doses It is claimed that weak radio active pads now on the market have a beneficial effect on rheumatism If in such a pad 0 1 μmg of radium is put, the cost at the current price of pure radium bromide would be 8s If a raw mineral ore containing radium is used the cost would only be a fraction of this If such a pad is sold for 10 guineas the profit is very great

An electrically heated pad is useful for [illegible] painful parts and can be bought for about 30s If an electrically heated "radio active" pad is sold for 20 guineas the profit is exorbitant No [illegible] of the clinical conditions other than [illegible] been found from treating cases of [illegible] with weak doses of radon

THE CONSTANT [illegible]

The switching on and off [illegible] cause nerve stimulation [illegible] therefore say that no [illegible]

skin. The effect due to electrolysis, however, is confined to surface tissue since the chemical changes take place at the electrodes. The skin flushes owing to the setting free of acid at the positive, and alkali at the negative, poles. The action can be intensified by dipping, before application, the positive (lint-covered) pole in dilute acid, and the negative one in dilute alkali The current is used also for iontophoresis, therapeutically active ions being introduced into the tissues by its passage.

MITOGENIC RADIATION

Gurwitsch first claimed that growing rootlets, dividing yeast cells, &c, emitted radiation in the ultraviolet region of the spectrum. Over 600 papers have been published on the subject. The American Bureau of Standards, after carrying out much research and investigating every claim, have come to the conclusion that such mitogenic rays do not exist.

THE STORY OF HAZELL'S

THE glory and power of printing is not all in the past. Its influence in the present makes it a powerful conservator of human progress. It is the hand-maiden of all the arts and industries, and a most effective worker in the world's workshop, to polish and refine the civilisation of the age. These words of Carlyle's open the story of Hazell's,[1] a story of one hundred years of printing. In 1839 William Paul set up a small printer's business at 14, Kirby Street, Hatton Garden. Four years later the business was purchased by George Watson, whose memory is perpetuated in the firm's full name, Hazell, Watson and Viney. Today the assets of the company exceed £1,000,000, the number of employees has risen from 3 to 1700, and the working hours have fallen from 69 to 45 per week. In 1850 George Watson installed steam to print the *Band of Hope Review*. Seventy-one years later the firm became responsible for the printing of the *Lancet*, and each week our readers may see how well Hazell's discharge this trust The story of Hazell's would be interesting if it recorded only the growth of a great business. But it does more. It gives a picture of the social changes of the past hundred years and tells also of the rise of staff welfare as a feature of progressive capitalist enterprise. Hazell's staff clubs, provident, thrift and pension funds, and even the printing works band, which now broadcasts regularly, all go to show how the benign employer can help the employee One healthy centenarian may pause and forget medicine for a moment to wish many happy returns to another.

THE PROTEIN MOLECULE

THE proteins or albuminoids (to give them an earlier name which is still used) have been recognised as a distinct group of organic compounds for over a century; but their properties are such that investigation by methods which have proved successful in other branches of organic chemistry has not produced results that can be easily interpreted. The importance of proteins as major constituents of living matter, however, has kept them in the foreground as an object of research, and many facts about them have accumulated. Thus, Richter's textbook [2] contained a calculation of the composition of crystallised albumin as $C_{720}H_{1124}N_{216}S_8$, due to Stohmann and Langbein; an estimate by Sabanjeff of the molecular weight as about 15,000, which agrees fairly with that calculated from the formula; and the statement that the products of the decomposition of proteins with acids were mainly fatty amino-acids. The sensitiveness of proteins to reagents seems to have been recognised early, especially the readiness with which egg-albumin forms an insoluble complex with mercuric compounds—a fact which saved the life of the chemist Thénard (1777–1857), who, having accidentally drunk a solution of mercuric chloride instead of a glass of water during a lecture, sent out for eggs and, having swallowed the whites, recovered rapidly from what would otherwise have been a fatal drink. The renewed interest in colloids, after the earlier researches of Graham (1805–69) had almost been forgotten, led to further discoveries about proteins Svedberg, using the ultracentrifuge, determined the molecular weights of several of them and found that these weights were mostly multiples of 18,000, that of egg-albumin being about 36,000. That of the virus of the tobacco mosaic disease is about 50,000,000 More recently Dr. Dorothy Wrinch [3] has, as a necessary preliminary to the investigation of the structure of chromosomes, analysed the available data relating to that of the proteins. She postulates, instead of a simple but improbable long chain of carbon compounds, a repetition of structural units from which are derived polyhedral forms suited to the globular proteins. Support is given to this cyclol theory by Langmuir,[4] who has also collaborated with Wrinch [5] in suggesting the probable structure of insulin according to the cyclol theory. In the discussion of this paper Prof. J. D. Bernal declared his inability to accept the proposed structure; but Dr. Dorothy Jordan Lloyd said that it was very helpful in "pulling recorded facts together and suggesting new lines of work."

PRACTITIONER'S PROGRESS

EVERYBODY has at least one story to tell but not everybody could render so entertaining an account of his stewardship as the pseudonymous author of "G.P." (London: Blackie & Son. 1939. Pp. 264. 7s. 6d). This unpretentious autobiography of one who is, in the best sense, a perfectly ordinary general practitioner, records his entry into hospital, his training and qualification, and his subsequent every-day thoughts and experiences in practice. Because the author writes with simplicity and sincerity of what he knows, without attempting to improve on the facts his book is quietly effective and absorbingly interesting. Never querulously, and often with humour, he enumerates most of the all too exacting demands made on its general practitioners by modern society. Of the medical curriculum he is both destructively and constructively critical. Thus, like many of us, he would like to see every student destined for general practice provided with greater experience of midwifery. He also advocates compulsory post-graduate study for all who have been in practice long enough to have grown stale. Dr. Ramow looks forward to the era of state medicine which will bring doctors into line with civil servants whose privileges and pensions he envies. These, he thinks, outweigh the tiresome restrictions of the individual which are apparently inseparable from bureaucratic control.

Corrigendum.—Mr. L. F. O'Shaughnessy points out that in the report from our Scottish correspondent (THE LANCET, July 22, p. 217) of his lecture in Edinburgh the last paragraph should read: In one series of 20 cases of cardiac revascularisation 15 patients had angina; of these, 1 died on the table, 1 died from uræmia three months later, and 3 died from heart-failure two months after operation.

BAYER PRODUCTS LTD inform us that their northern branch will be removed on Aug. 4 to new offices at Blackfriars House, Parsonage, Manchester, 3.

VISCERAL NEUROSES

BY JOHN A RYLE, M D Lond , F R C P

REGIUS PROFESSOR OF PHYSIC IN THE UNIVERSITY OF CAMBRIDGE, CONSULTING PHYSICIAN TO GUY'S HOSPITAL, LONDON

II*

Œsophageal Neuroses

THE two common neuroses of the gullet are heartburn and globus Aerophagy is commoner, but it is a neurosis of swallowing, to some extent controllable by the will, and involving the cooperation of the pharynx It is attended by gastric as well as œsophageal discomforts For these reasons it has been excluded from the present discussion A third and much rarer neurosis is œsophagismus or functional spasmodic dysphagia

HEARTBURN

It is remarkable that the very familiar symptom of heartburn should still stand in want of satisfactory physiological interpretation Payne and Poulton (1923), on the basis of personal experiments with balloons, have associated it with peristaltic activity and a rise in manometric pressure, but the quality of the symptom is unlike the quality of pain or discomfort accompanying clinically or radiologically demonstrable spasm in the gullet itself or in other tubular organs Except in strangury and tenesmus there are few other examples of a burning visceral discomfort It is, however, worthy of note that these two symptoms are *associated* with local sphincteric over action, and that they affect a point of junction between a sensitive and an insensitive mucosa The same is true of heartburn, which, although it may spread higher, is commonly felt in the neighbourhood of the cardia, where the sensitive œsophageal and insensitive gastric mucosæ meet

The older view that heartburn was due to acid stimulation by regurgitated gastric juice also lacks support, as Hurst (1911) has shown, in that it cannot be produced with acids, although it is relieved by alkalis Furthermore, it can occur in patients with normal acidity, hyperchlorhydria, or achlorhydria It has sometimes suffered confusion with acid eructation, which is a separate phenomenon The burning quality of the symptom is quite unlike the ache or more positive pain of colonic or rectal spasm, and it is very different from the pain experienced on swallowing a large bolus or a hard fragment Thus suggests the possibility that the mucosa is the seat of the sensation rather than the musculature, even though there be a minor degree of associated spasm There is no dysphagia or regurgitation of food accompanying heartburn, and it may be momentarily relieved by the act of deglutition—further arguments against any considerable degree of positive muscular overaction The rarity of heartburn in association with organic disease of the stomach or gullet, its frequency as an occasional symptom in otherwise healthy persons under conditions of rush, worry, or injudicious feeding, and as a more persistent symptom in persons of nervous type or faulty habits, or during emotional stress, and also in the later months of pregnancy, all justify its inclusion among the œsophageal neuroses Œsophagitis is an unlikely explanation, for the symptom is not usual in alcoholics, and it is unaccompanied by hawking or regurgitation of mucus or immediate pain on swallowing Radiological studies give negative results

The symptom is described as a "burning discomfort" rather than a "pain" It is felt along the course of the gullet anywhere between the manubrium and xiphisternum but more often at the lower level It may last for seconds, minutes, or longer periods It comes on either immediately or an hour or more after meals but bears a less precise relationship to food than do the organic dyspepsias Some patients relate it to certain foodstuffs, but no single type of food is constantly incriminated Curtailment of starches and fats is often beneficial I have only rarely noted it in association with indisputable allergic phenomena It often accompanies mental anxiety One man repeatedly noticed it after coitus It is temporarily relieved by alkalis, particularly by sodium bicarbonate and aluminium hydroxide The most obstinate types of heartburn are those found in association with the later months of pregnancy and in highly nervous individuals In each of these groups the symptom may cause considerable and prolonged distress In the former it usually disappears completely after parturition

Among 22 cases in which the symptom was sufficiently troublesome to lead in itself to consultative advice there were 13 men and 9 women 5 patients being of Jewish extraction, 1 a Parsee, and 1 a Persian In 10 cases multiple nervous factors were evident without any profound psychological inquiry The following factors were incriminated by 9 patients (1) alcohol, sauces, and afternoon tea, (2) wine, acid fruits, and lobster, (3) bacon and fats, (4) whisky and cocktails, (5) sherry, celery, onions, and kippers; (6) fats, (7) whisky, cheese, pastry, some fats, and Indian tea, (8) wines, condiments, and eggs, and (9) liqueurs, cigarettes, and starchy foods In 7 of the 9 statements alcohol in some form receives mention Among the other substances there is no close conformity One patient, a student, had been smoking forty cigarettes a day In one case a small œsophageal pouch was revealed radiologically, but, although this must have been of long standing, the symptom had been in evidence for a short time only, the patient was an asthmatic and admitted to recent worry

A mild and a severe case are here described

CASE 1.—Male, aged 49 Troublesome heartburn during the past year, felt in the course of the gullet, coming two hours after food, and aggravated by alcohol, sauces, and afternoon tea A well conditioned man, too stout, living rather too well and taking no exercise Nosophobia admitted Reassured and advised to cut out food with afternoon tea, to curtail fats and starches, and to take more exercise Prompt and lasting relief

CASE 2.—Male, aged 72 Chronic heartburn for ten years A Jew much occupied with business, which he discusses at meals Aggravation by wines condiments, and eggs A big starch-eater Holidays formerly brought relief but now do so no longer Symptomatic relief with Jenner's lozenges

In the four cases which follow, as a separate group there were so many associated personal and familial disturbances of a kind generally classified as allergic

* The second Croonian lecture, delivered at the Royal College of Physicians on May 23 1939 Lect I appeared in our last issue

that it is reasonable to inquire whether heartburn should sometimes be regarded as a local manifestation of a more general susceptibility.

CASE 3.—Male, aged 70. For years troubled by heartburn. One physician had diagnosed duodenal ulcer, but the symptom was in no way characteristic, and X-ray examination did not confirm. He was intolerant of vermouth and salt meats and said that "cigars did him no good." The symptom was especially bad every third day and arrived after lunch and between 3 and 6 A.M., when it was sometimes accompanied by hiccups and water-brash. He was lean and nervous and had well-marked factitious urticaria. His mother and a maternal uncle were asthmatic.

CASE 4.—Male, aged 30. Heartburn from the age of 16. The symptom was most in evidence at middle morning, after lunch, and between 6 and 7 P.M. He took alkalis regularly and was very careful with his diet. His previous history included urticaria, hay-fever, and migraine. There was an allergic family history on his mother's side, and one of his children had hay-fever, asthma, and urticaria. His mother was intolerant of eggs. Full radiological and chemical investigations were carried out but did not reveal any evidence of organic disease.

CASE 5.—Female, aged 39. Married, with three children. Heartburn of long standing, which started with her pregnancies. Radiological studies of stomach and gall-bladder gave negative results, and she had been subjected without benefit to a long period of treatment for ulcer. She was also liable to migraine and to bouts of painful rectal spasm lasting twenty minutes. She was suspicious of tea, cream, and rich foods, and admitted to a cancer-phobia.

CASE 6.—Male, aged 26. Always nervous and "stomach-aches" frequent in childhood. A wasted left arm from poliomyelitis. Complained latterly of heartburn, fullness after food, and salivation during and after food. For the past year he had been troubled with repeated attacks of giant urticaria and angioneurotic œdema. The transverse and ascending colon were unduly palpable. His paternal grandfather, one brother, and one sister were asthmatic. He was inclined to blame milk for the angioneurotic œdema. He developed much invalidism but improved after encouragement and a period in hospital.

These allergic histories notwithstanding, it will be seen that in three of the four cases there was a possible explanation in nervous unrest apart from any food idiosyncrasy. I have not encountered heartburn in human anaphylaxis or serum-sickness, and it is not a common association with asthma or cutaneous allergy when these are the presenting symptoms Perhaps the most that can be said at present is that skin tests and food-elimination tests should be more worthy of a trial in obstinate cases of heartburn accompanying accepted allergic phenomena than in cases lacking these associations.

GLOBUS

The relationship of globus, or a sense of "lump in the throat," to emotional disturbance needs no emphasis. It is a common experience in the transient sorrows of childhood and not rare with the greater griefs of adult life. In the nervous patient it is both more frequent and more obtrusive and may of itself become a cause of anxiety by creating a belief in local organic disease. Thus it may both cause and be perpetuated by a nosophobia It is felt below the pomum Adami or retrosternally. It gives the impression of a small globular foreign body lodged in transit It is unaccompanied by pain, dysphagia, or regurgitation. A very similar discomfort is sometimes described in the stomach, the colon, or the rectum by the victims of neuroses affecting these organs, and in the two last-named situations it may be associated with demonstrable tonic contraction of the bowel. It is difficult to avoid the conclusion that a symptom so precise and localised as globus has a physical basis Because it has been called globus hystericus, we are not to suppose that it is imaginary. A slight localised tonic contraction of the œsophageal musculature would best explain it. Such minor changes of tonus in this situation are not as yet susceptible of demonstration by our special objective methods.

Among 7 patients specifically referred for this symptom 2 were Jewish and 1 Welsh; 5 were women and 1 a boy aged fourteen. A brief account of these cases will help to typify related circumstances.

CASE 7.—Female, married, aged 47, of Welsh nationality and nervous. Eighteen months' history of "a lump in the throat," situated behind the sternum, present most of the time but sometimes absent for two or three days. Nervous stresses were liable to cause vomiting On a recent holiday she had felt quite well and happy and lost the symptom. She had a strong cancer-phobia.

CASE 8.—Female, married, aged 43. An emotional type, fond of admiration. Several months' history of a "lump in the lower chest" or epigastrium. No relationship to food. Menopausal irregularity. This patient and her sister both suffered from spasmodic rhinorrhœa.

CASE 9.—Female, married, aged 60. Complained of a feeling of a lump in the throat unaccompanied by pain or dysphagia. Also flatulence with belching, which sometimes relieved the globus. An air-swallower.

CASE 10.—Female, married, aged 45. Globus for nearly a year. A throat specialist, a general practitioner, and unorthodox opinion had been consulted in turn. The symptom had developed in the first instance at a time of great anxiety about a breast tumour, which proved, on excision, to be non malignant.

CASE 11.—Female, married, aged 36. Discomfort and a "choked-up feeling" in the gullet, which led to frequent swallowing. Much depression, domestic overwork, and, in the months preceding the development of the symptom, anxiety about her husband's business.

CASE 12.—Male, aged 36. A worrying nervous Jew. Had complained for four years of a feeling of "a lump behind the breast-bone which made him want to swallow." Business worries and cancer-phobia. His mother had died of cancer.

CASE 13.—An intelligent nervous Jewish boy, aged 14. Had complained for fifteen months of a "lump behind his breast-bone," at first on swallowing only but latterly more persistently. No pain, dysphagia, or regurgitation. Aggravation by excitement and examinations. Sometimes relief with belching. Until the age of 12 he had been troubled with enuresis.

In only one of these cases (case 8) was there an allergic association. In all of them nervous influences were pronounced

SPASMODIC DYSPHAGIA

At one time I included in my index of diagnoses a separate œsophageal neurosis characterised either by pain in the course of the gullet or by a transitory difficulty in swallowing. The association of these symptoms with a nervous temperament and a long history, the intermittency of the attacks, and the negative results of clinical and radiological examinations had seemed to justify the opinion. Achalasia

of the cardia, dysphagia with anæmia (the so called Plummer Vinson syndrome), and an early carcinoma of the cardiac end of the stomach with an initial negative X ray report were familiar to me as differential possibilities Since then improvements in radiological technique have revealed, and papers by Friedenwald and Feldman (1925), von Bergmann and Goldner (1932), and Hurst (1934) have described, a new cause of œsophageal dysfunction in the small intermittent hiatus hernia of the cardiac end of the stomach Reviewing my case-histories in the light of this new knowledge I must now exclude from the functional group several cases originally filed under the heading of nervous œsophageal spasm Here is a case in point

CASE 14 —A woman, aged 69, was troubled during a period of three years by a frequent burning sensation in the course of the gullet, to which were added curious spasms while eating in which "the food would not go down" At times she was compelled to leave the table and bring up food These episodes were sometimes followed by hiccups Radiograms showed a normal gullet A diagnosis of nervous spasm was made, and there was considerable amelioration with a fuller diet, alkalis, and Luminal A later re-examination in special postures revealed a small hernia of the stomach through the œsophageal opening

Cases of this kind can sometimes be recognised clinically by the association of the symptoms with stooping, sitting, or other postures or movements which increase intra abdominal pressure One patient had been told by an observant daughter that she ought always to eat at a "snack-bar" Hiatus hernia can also cause severe substernal pain and may even simulate angina or a coronary thrombosis

After exclusion of all organic possibilities known to us, however, there still remains a small group of spasmodic dysphagias in which nervous factors alone would seem to supply the cause

CASE 15 —A nervous woman, aged 43, after a tiring day was seized with an inability to swallow while eating fish This inability persisted for ten hours, and she could not even swallow fluids or her saliva There was no pain During the previous four years she had experienced the same symptom on several occasions, but it had only lasted for ten minutes or so Eating fish when she was tired had been the chief precipitating factor There was no radiological evidence of œsophageal disease

McGibbon and Mather (1937) have discussed the radiological diagnosis of cases coming within this category.

Among the œsophageal neuroses of constant pattern we may thus include heartburn, globus, and (with careful reservations) nervous œsophagismus or spasmodic dysphagia The organic states which may be erroneously attributed to an œsophageal neurosis are —

(1) Achalasia of the cardia, shown by Rake (1927) to be associated with a degeneration of Auerbach's plexus and invariably accompanied by demonstrable dilatation of the gullet Dysphagia and regurgitation are the main symptoms, but pain may be added when the condition is complicated by secondary ulceration or by œsophagitis Emotional factors can undoubtedly aggravate symptoms in achalasia, although they cannot be claimed as its cause

(2) The dysphagia with anæmia described by Kelly (1930) With this there is associated glossitis, a hypochromic anæmia, and sometimes splenomegaly The dysphagia is at the pharyngo-œsophageal level There is no pain

(3) Intermittent hiatus hernia of the stomach. Dysphagia and sometimes severe pain induced by sitting, stooping, or the reclining posture and relieved by standing, together with a barium X-ray examination in the Trendelenburg position, supply the diagnosis in most cases

In all of these conditions intermittency of symptoms and length of history may at first suggest a nervous disorder, and special methods are needed to complete the diagnosis

In the three neuroses reviewed, diagnosis is based upon the character of the symptoms themselves, the absence of all evidence of organic disease, and a general conspectus of the type and temperament of the patient and of the adverse circumstances of his life, heredity, habits, and environment

Colonic Neuroses

In this section attention will be devoted to those neuromuscular disturbances of the colon which have been variously designated chronic colospasm, spastic constipation, spastic colon, and tonic hardening of the colon In the past these disorders have commonly received the erroneous diagnosis of "colitis" To its most aggravated form, which is characterised by pain and an excessive output of coagulated mucus with the stools, the label of mucomembranous colitis has been applied, but here also, as Hurst (1938) has shown, there is no evidence of a true inflammatory lesion of the colonic mucosa.

A considerable literature has grown up round the subject of spastic colon—the name which I shall, for brevity, employ—and yet the condition continues to pass undiagnosed or to be misdiagnosed and to be treated erroneously in consequence There is probably no other single condition which has led to so much unwise local treatment and to so many needless abdominal operations As long ago as 1906, Hawkins wrote of the intestinal neuroses "They are at this moment particularly worthy of study, owing to the advance of abdominal surgery, not because they are amenable to surgical treatment, but rather because they need protection" This sound advice is still too little heeded

The condition of spastic colon was first described in 1830 by Howship Cherchewsky (1883), Fleiner (1893), Hawkins (1906), Hurst (1910), Turner (1924), and Stacey Wilson (1927) have all added noteworthy descriptions I reported on it myself ten years ago and have paid particular attention to the genesis of the pain which is the most frequent and troublesome symptom (Ryle 1936) My earlier analysis was based on a study of 50 cases For this occasion the notes of 321 cases have been examined This later series included 169 females and 124 males in the "spastic colon" group and 28 female patients in the group with excessive output of mucus, which some would prefer to classify separately under the heading of mucous or mucomembranous colic Of the need for such separation I am not satisfied The smaller group differs only in the severity of symptoms, in the quantity and special character of the bowel discharges, in the greater degree of the nervous instability of its victims, and in the fact that they are almost all women Cases with evident organic disease of the abdominal viscera were excluded from this series, and there were no instances of plumbism

The age-distribution of these cases at the time of consultation is of some interest Into the second decade fell 2 per cent of the cases, into the third 16 per cent, into the fourth 29 per cent, into the fifth 26 per cent, into the sixth 10 per cent, into the seventh 7 per cent, and into the eighth 1 per cent Thus 90 per cent of the patients were between

the ages of twenty and sixty; 74 per cent. between thirty and sixty, and 55 per cent. between thirty and fifty. There is therefore a preponderance of cases in that period of life in which work, anxiety, economic stress, and domestic adjustments are dominant. A similar age-distribution is observed in the cardiac neuroses and in certain organic conditions, notably duodenal ulcer, which seem to be related, at least in part, to anxious temperaments and the nervous stress of modern life. In a random series of 321 consecutive cases (excluding those with spastic colon) 70 per cent. were between the ages of twenty and sixty, 63 per cent between thirty and sixty; and 43 per cent between thirty and fifty.

Of other æthological factors, the case-histories and the sampled statements which follow give a general indication They can convey no adequate idea of the qualitative and quantitative value of the several contributions. Only the most intimate personal histories and after-histories can allow such estimates It need hardly be mentioned that multiple factors of diverse type, but all capable of acting as "irritants," are often recorded in the same case. The patients and their colons are alike sensitive to various forms of adversity. Among the abbreviated entries from the fuller stories taken from my tabulated lists were the following: "fatigue, cold, and worry"; "a Jew, anxiety, worry"; "nerves, worries, pork, salads, fruit"; "alcoholic husband, devoted 'hanger-on,' cancer-phobia, cold"; "death of parents, childless marriage"; and "nuts, fruit, laxatives, worry."

Among the 321 cases a clear history of worry, anxiety, domestic unhappiness, or other emotional disturbance was noted in 188 cases. Fatigue was specifically recorded in 30 cases Cold (with particular emphasis on east winds in several instances) was mentioned in 37 cases. Evident abuse of purgatives, although a much larger number habitually employed them, was mentioned in 13 cases; tobacco excess in 16; aggravation by walking, motoring, or jolting in 14 Of food idiosyncrasies, vegetables, nuts, or fruit were specifically noted in 23 cases and chocolate in 5 There was a history of antecedent dysentery or other acute bowel infection in 9 cases

Of associated neuroses the following were recorded: migraine in 28 cases; asthma in 16; hay-fever or spasmodic rhinorrhœa in 9; œsophageal neuroses in 8; proctalgia in 6; cardiac neuroses in 5; dysmenorrhœa in 5; urticaria in 3; epilepsy in 2; and angioneurotic œdema in 1 case. There were 2 examples each of associated vaginismus, bladder neurosis, and speech stammering. There was a family history of asthma in 14 cases, of spastic colon in 5; of urticaria in 2, and of angioneurotic œdema in 1 case The frequency of all these personal and familial associations may be regarded as an underestimate, for I have only in late years pressed my inquiries in these directions, and in the fullest routine histories patients often omit evidence which does not at the time appear to them relevant or interesting. In a random series of 321 consecutive cases (excluding those with spastic colon) there were 19 cases of migraine, 3 of asthma, and 3 of urticaria

There was a history of appendicitis with operation in 13 cases (4 per cent.). In no less than 86 cases (26 per cent) the appendix had been removed without good historical evidence of appendicitis and commonly for symptoms similar to or identical with those still complained of by the patient I have for some years been at pains to enter "appendicitis" and "appendicectomy" as distinct events in my case-histories. Other operations undertaken for symptoms attributable, so far as could be judged, to the colonic dysfunction were nephropexy, cholecystectomy, hysterectomy, ovariectomy, an exploration, and multiple operations—each in one instance

As illustrative of physical or psychological type, the following adjectives were often encountered in my notes: lean, thin, spare, dark, pale, wiry, anxious, nervous, tense, neurotic Many patients suffered from "dead fingers" in cold weather. Conversely, we find that spastic colon is rarely recorded in fair haired blue-eyed plump healthy complexioned types with good circulation and placid dispositions Its victims are industrious and conscientious and do not, as a class, give way to symptoms unduly or make of them an excuse for invalidism, even though they may appreciate them—as they appreciate their other troubles—more sharply than the common herd Their symptoms are, indeed, very real and often a serious handicap to busy lives

We have evidence for the sensitivity of their colonic mucosa and musculature to local irritants such as nuts, raw fruits, vegetables, and purgatives; to nicotine in some cases; and in many to the general effects of fatigue, cold, and physical jolting But the central, if often submerged, irritations of care, fear, and conscience would seem to play a more important part than any of these Immediate fear can precipitate defæcation in the herbivora or in soldiers before battle. It is not, perhaps, surprising that anxiety, which is a low-grade and protracted form of fear, operating through the preoccupied mind of civilised man, who has learned to inhibit his external display of emotion, should sometimes provoke disturbances of visceral tone and peristalsis In the case of the bowel sometimes pain and sometimes diarrhœa results. A medical man, himself a sufferer from spastic colon, once told me that he knew of no better laxative than an anxious day's work ahead of him. It is repeatedly mentioned by patients that their colonic pain is worse after defæcation, and that they are more comfortable when constipated, so readily with them does tonic action pass into over-action.

Constipation is described in approximately half the cases The remainder have a normal function or bouts of looseness Mucus in the stools is often mentioned In the cases of "mucous colic" there is a true and a spurious diarrhœa, the stools being either loose and frequent or, more commonly, scybalous and frequent. Both in simple spastic colon and in "mucous colic" the dejecta are commonly fragmentary, hard, and likened by the patient to those of sheep or rabbits This fragmentation is but another sign of the tonic and peristaltic over-activity of their intestinal musculature.

Passing now from æthology and associated disorders to the malady itself, we find that the usual complaint is of discomfort or actual pain in some portion or portions of the large bowel. Ascending or descending colon is most commonly indicated (and the gesture may be very exact) with the palm of the hand lying in the course of the affected part in one or other flank or iliac fossa Less frequently the transverse colon is indicated by drawing the ulnar margin of the hand across the abdomen at the "watch-chain" level. In other cases a lower abdominal pain without this precise linear distribution is described. The discomforts are likened to a "ball" a "lump," a "bar of lead" or described as "a feeling of stoppage" The pain is a continuous wearing ache, not rhythmical or griping as in the pain of purgation, enteritis, or intestinal obstruction; and lacking the

immobilising sharper quality and soreness of visceral or peritoneal inflammation It may last for hours and be present day after day Very occasionally, however, colonic spasm comes in acute attacks and may cause pain of great intensity, simulating one of the major crises which signal a stone in the ureter or the bile duct

Physical examination in the chronic type often reveals an unduly palpable colon in one or more of its three accessible parts A contracted colon is often felt in health in the left iliac fossa, but it becomes a more hard and rigid structure in a state of tonic spasm, and in the condition under review it may often be felt in its transverse and ascending portions Shortening and straightening accompany the rigidity In the region of the cæcum these changes may be felt, or even seen in the bath, by the patient himself like a tumour or "cricket ball" in the right iliac fossa The bowel may be tender to palpation and is generally so in the cases of "mucous colic" Radiological examination after a barium meal (the results varying with the state of the bowel at the time) show an intensification of the normal haustrations of the colon, a thin string of barium in the affected portions, or, more rarely, a strictly localised spasmodic constriction The barium enema, usually to be preferred in colonic studies, may in these cases be less informative than the meal as it distends the walls of the gut in passage

Sigmoidoscopy is often difficult and is apt to be unusually painful on account of the spasm The lumen of the bowel can be seen to narrow down to a pin point before the advancing instrument A firm ring contraction is sometimes felt during a digital examination of the rectum

These and other observations leave small room for doubt that the pain is an expression of exaggerated tonus in the bowel musculature. The condition has been called "asthma of the colon," and indeed bronchial and colonic spasm, in their behaviour, chronicity, and intermittency, have much in common, apart from the fact that they may coincide in the same patient or in a family In extreme contraction the colon has been seen on the operating table to become white and hard, and it is not impossible that the attendant ischæmia and anoxia may be the immediate cause of the pain

Relief of pain is obtained by warmth, the hot bottle and hot bath being especially helpful, by belladonna in adequate dosage, but not in every case, and a warm gruel enema, according to Howship (1830), may also bring comfort All these measures tend to counteract spasm In some cases the pain develops late after food and is relieved by food and so prompts a suspicion of duodenal ulcer In most cases sleep is not disturbed, the bodily and mental relaxation seeming to extend their beneficence to the troubled organ

In the differential diagnosis such possibilities as appendicitis, peptic ulcer, diverticulitis, carcinoma coli, ulcerative colitis, intestinal starch indigestion, renal colic, and ovarian or tubal disease may have to be considered In the great majority of cases the history and especially the length of the history, the type and durability of the pain, the temperament of the patient, and a careful examination should lead to a correct opinion Where doubt remains fuller investigation must be employed, and in appropriate subjects carcinoma coli and diverticulitis are particularly to be excluded

Of the erroneous labels which are liable to be attached to these cases chronic appendicitis and colitis are the commonest Both lead to undesirable physical treatments, and both tend to fix the patient's mind unduly on the complaining part of his anatomy The disappointment which follows futile surgery only accentuates his physical and mental misery Here are some illustrative cases

CASE 16.—A highly nervous and anxious professional man, aged 60, was seen in 1932 and 1934 for right-sided abdominal pain He described his cæcum as "blowing up" at times and feeling "like a sausage" He had had a life full of worries and had recently lost his wife after a long illness During the summer and during two holiday periods he lost his symptoms Latterly the pain had begun to wake him at 2 A.M., but he would immediately drop off to sleep after a bromide and belladonna draught He had begun to entertain fears of cancer

CASE 17.—A medical student, aged 21, who gave a history of diarrhœa and vomiting after eating turbot in 1927, of appendicectomy without relief of pain in 1929, and of nocturnal pain with diarrhœa and sickness in 1930, was seen in 1931 for a dragging pain in the right iliac fossa, across the epigastrium, and below the left rib margin He was tender along the course of the ascending and descending colon Two of his brothers had colonic symptoms, and one had been admitted to Guy's Hospital as a case of intestinal obstruction but was found to have an intense spasm only of the descending colon Investigations of the alimentary tract gave negative results Full reassurance and rational treatment were followed by a disappearance of symptoms, and a year later he was reported as in very good health

CASE 18.—A man who had lived in the east for many years but had had no dysentery complained of flatulent discomfort in the right and left iliac fossæ and the epigastrium and of a feeling of "wind in the bowel which would not pass" He stated that fried foods and beef disagreed and that "pork was poison" Symptoms had first appeared ten years previously at a time of great overwork and worry, when his "nerves were bad" He recognised that worry or emotion in anticipation of small troubles was the chief precipitating cause He was lean, nervous muscular, and wiry. His reflexes were very brisk His cæcum at the examination was firm and contracted like a sausage The sphincter gripped the finger during a rectal examination His mother was liable to angioneurotic œdema if she ate strawberries

CASE 19.—Multiple neuroses A young man, aged 26, had had cyclical vomiting in childhood, for many years hay fever, and for one year asthma He was also liable to migraine and was brought to see me partly for these symptoms and partly for "spastic colon" with excess of mucus in the stools In the previous year he had been given a vaccine for the bowel condition and promptly developed an anaphylactic attack, with œdema of the face and dyspnœa, relieved by adrenaline His bowels were erratic and often loose He had observed that he was better without alcohol and when he took exercise His cæcum was bulky, he was lean, and he had a low blood-pressure, but there were no signs of any organic disease

CASE 20.—"Mucous colic" A small nervous undersized married woman aged 35 Seen in 1931, 1932, and 1933 for left-sided abdominal pain constipation, and the passage of much mucus In 1926 she had had her appendix removed and ovarian cysts were said to have been cauterised on account of her symptoms, which persisted Aggravation by cold A cancer phobia also played its part In 1933, after shooting on a very cold day in December, she had a febrile attack with vomiting and diarrhœa, leaving pain again in the transverse and descending colon There was tenderness in the course of the colon, which at times could be felt in contraction under the palpating hand The domestic situation was profoundly

unsatisfactory, for she was unhappily married to a chronic alcoholic whom she could not divorce for religious reasons and was also embarrassed by a devoted admirer.

Now, although, as has been shown, the familiar allergic states are commonly associated with the condition of spastic colon, and although food idiosyncrasy sometimes plays a part, we have scarcely as yet enough evidence to include this particular dysfunction in the allergic category Children with allergy are sometimes stammerers, but it would be an unwarrantable extension of the use of the term to describe stammering as an allergic manifestation. Is there any more reason so to describe the stammering colon? Occasionally, however, cases of acute colonic disturbance are seen in which the arguments for allergy are stronger In these cases the associated phenomena may synchronise with the attack instead of appearing separately and at other times. They may include vomiting, diarrhœa, angioneurotic œdema, and shock-like symptoms. Of such cases I have given an account elsewhere (Ryle 1936). A specific cause or group of causes may or may not be discoverable by careful inquiry and food-elimination or cutaneous tests.

CASE 21.—In a case which has been of great interest to Sir Arthur Hurst and myself, a woman, aged 34, with a strong family history of asthma and hay-fever, and herself liable to hay-fever and digestive disturbances, developed, at intervals, severe abdominal attacks with the following characters: acute lower abdominal pain; a frequent desire to defæcate; the passage of long mucous casts and, in the worst attacks, of much bright blood from the bowel. The sigmoidoscope, however, revealed no ulceration of the bowel, even during active bleeding. Skin tests showed her to be sensitive to pork. She recognised herself as intolerant of pork and eggs. One of the worst attacks started after she had become very cold at a race-meeting and had drunk coffee. When all other measures had failed to relieve the symptoms in a severe attack, Hurst found that 1 drachm of castor oil at night and 1 drachm of sodium sulphate in the morning brought immediate relief.

In connexion with these rare cases of acute hæmorrhagic (non-infective) "colitis" it is worth remembering that Dean and Webb (1924) produced a very similar condition in experimental anaphylaxis in dogs

Rectal Neuroses

Although less frequent than the neuroses thus far considered there is one rectal neurosis so definite in character and circumstance and often so painful that it is a matter for surprise that it has received such scant notice in the literature Under the name of proctalgia fugax Thaysen (1935), apologising for the mixed derivation, drew attention to a painful form of rectal spasm which came on in the absence of any discoverable organic cause and which must long have been familiar to physicians and proctologists.

The usual complaint is of a severe ache—of tooth-ache quality, rapidly crescendo and sometimes reaching an unbearable intensity—which is located in the rectum and sometimes gives the impression that the coccyx is being forcibly bent forwards or backwards The pain may be so bad as to cause pallor and fainting. Its duration is usually from five to fifteen minutes, very rarely longer Although it may also come on in the day, the common account is that the symptom arrives, usually at long intervals, during the night, and especially towards the early hours of the morning. As a rule it bears no relation to defæcation, and in this it is distinct from the pain of rectal carcinoma, anal ulcers, and fæcal impaction. Occasionally, however, it may succeed defæcation. In the early moments of an attack there is a desire to defæcate or to pass flatus, and relief is sought in this way without success. The rectal crises of tabes dorsalis should be readily excluded by a careful history and routine examination of the nervous system Some patients describe a much milder sensation of rectal globus. Proctalgia or rectal spasm has a close association with mental worry and fatigue Colonic spasm is a common accompaniment, and in a minority of cases there is an attendant history of migraine or other allergic disorder. In a group of 15 cases it was associated in 1 with migraine and a family history of migraine and asthma; in 1 with spastic colon and urticaria; in 1 with spastic colon and migraine; and in 6 with spastic colon only. The average age of the patients was forty-five There were 9 females and 6 males In no less than 8 cases a very unsatisfactory or unhappy psychological situation was revealed, or the patients were recorded as of excessively worrying and introspective type One patient recorded great relief from distension of the rectum by immediate inflation with air from a Higginson's syringe Otherwise there is no treatment for the immediate attack, and, indeed, the treatment should correctly be directed to the underlying causes and includes especially the counteraction, when possible, of anxiety and fatigue.

CASE 22.—A masseuse, aged 41, complained of a dull aching pain in the right iliac fossa, which woke her between 2 and 4 A.M. and sometimes lasted all day. She was able to feel a hardened contracted colon on the right side. For some years before this she had been liable to painful cramps in the rectum, lasting up to a quarter of an hour, and occurring both by night and day. There was a history of urticaria following lobster and strawberries. She smoked fifteen cigarettes a day. Family history negative. A firm ring-contraction was felt during a digital examination of the rectum.

CASE 23.—A married woman, aged 46, complained of left-sided colonic pain and of severe nocturnal attacks of rectal spasm, in one of which she fainted. Coitus seemed to predispose. She smoked twenty cigarettes a day.

CASE 24.—A woman, aged 50, was subject to intermittent abdominal attacks characterised by a discomfort "as though food had stuck" and located either in the epigastrium or the flanks At intervals, for many years, she had also been liable to violent attacks of rectal pain, chiefly at night but sometimes in the day. The pain would continue for as much as half an hour. Relief was obtained by inflating the rectum with air.

CASE 25.—A woman, aged 46, complained of "terrible attacks" of pain starting sometimes in the sacral region, sometimes in the vagina, and ending up with a feeling "as though the lower spine were being pushed out" The attacks were mainly nocturnal and would last for a quarter of an hour or even as long as three-quarters of an hour. There was a desire both to defæcate and to micturate. There were varying intervals between attacks, and she might be free for two months. She had had many operations, and the symptoms succeeded the last one, soon after which her husband had been accidentally killed. Her doctor had seen her "writhing in pain" in an attack She was liable to migrainous headaches. Sigmoidoscopy and cystoscopy revealed no abnormality.

CASE 26.—Rectal globus. A young dental surgeon, liable to migraine, and previously seen for lower abdominal pains, complained of a troublesome rectal

discomfort "as though the bowel wanted to move" At first it was associated with standing Later the symptom occurred between midnight and 2 A.M It was in abeyance on holidays There were no signs of organic disease He was over-anxious, had previously had a cancer-phobia and was working very hard and smoking too many cigarettes After reassurance and adjustments in his life, cessation of smoking, and luminal at bedtime he lost his symptoms and gained 9 lb in a month

Vesical Neuroses

The neuroses of the bladder, although commonly considered trivial, are both numerous and familiar Some of them cause much mental distress Precipitate and involuntary micturition is a recognised response to acute fear in man and animals A frightened flock of sheep affords a good demonstration of emotional evacuation both of bowel and bladder The recruit before battle may be unable to contain his urine During the European crisis of September, 1938, I was questioned about a nervous man who was similarly afflicted. The nocturnal enuresis of children, notwithstanding the multiple explanations and physical treatments which have been applied to it, is now generally accepted as a nervous phenomenon, a view which is well supported by its high incidence in the nervous offspring of nervous parents, its aggravation by rebuke and punishment, and its good response to sensible handling and time The diurnal frequency of nervous women, occurring either without evident cause or as a sequel of a departed cystitis, is also common and can generally be distinguished from frequency due to an organic polyuria or pollakiuria by the finding of a normal urine and by the fact that it is in abeyance at night Apprehension of the desire to micturate during social engagements when opportunity is lacking is probably one of the reasons why many women of anxious type restrict their fluid intake unduly In men nervous inhibition of micturition is a familiar experience of the consulting room and the life assurance examination, and there are many who cannot pass water in a public urinal The initial retention of urine which follows abdominal and rectal operations may reasonably be attributed to reflex irritation and inconvenient posture Its persistence is often abetted by anxiety A new and useful remedy in these cases is available in Doryl (carbaminoylcholine chloride)

The more serious nervous incontinences and retentions are comparatively rare and are accompaniments of graver anxiety states Sir James Paget (1879) described the case of a man who developed a nervous retention while walking with a lady friend and declined ever to go walking with her again, because he knew the association of ideas would be too strong for him and would again invite the same disability He also related the case of a clergyman who always passed a catheter before going into the pulpit, because on one occasion, having experienced an urgent desire to micturate during a sermon, he found himself unable to perform the act when the sermon was over

Nervous incontinence may cause misery as great as nervous retention and, in the two cases which follow, complicated other visceral neuroses of emotional origin I have observed no special association between bladder neuroses and the allergic state

CASE 27.—A young woman, who had been liable to gastric and colonic disturbances since childhood and had experienced a few severe attacks of rectal spasm, developed great urinary frequency and was unable to hold her water if she heard a tap running and sometimes, when paying social calls, had urinary incontinence on the door-step A severe psychic trauma had preceded the aggravated phase of this neurosis

CASE 28.—A young married woman, nervous and hypersensitive, at a time of anxiety in connexion with domestic and social affairs, developed diarrhœa and bladder incontinence She also suffered from vaginismus, experienced bowel and bladder pain after evacuation of these organs, and was liable to incontinence in cold weather She was troubled with nightmares always in connexion with lavatories and for a long time was harassed by multiple phobias and anxieties

If we except the acts of blushing and fainting, the conditioned reflex in daily life is, perhaps, better illustrated by the disturbances of micturition than by any other bodily dysfunction Even in good health modifications of natural habit by circumstance are frequent. The old device of turning on the tap to encourage micturition must clearly be related to the environmental associations of the act or to the sound of running water

A physician became aware of a curious conditioning of the desire to micturate After examining a patient in his consulting-room it was his invariable custom to take the specimen of urine to test in his laboratory, carry out the test, and then pass on to the lavatory to wash his hands At this stage, with the taps running, he repeatedly had an inclination to pass water, although he had experienced no desire a moment before As time went by he noted with interest, although he had continued to pay scant attention to the phenomenon, that the reflex had become antedated, and that lighting the Bunsen burner to test the patient's urine now induced the desire

If similar sequences may be held to obtain in the case of the more troublesome visceral over actions —e.g., bronchial and colonic spasm, urinary frequency, and tachycardia—we discover at once an accessory explanation for their chronicity and for their seemingly inconsequent recrudescence independently of any observed external agency or immediate emotional stimulus

Clearly, quite trivial actions and mental associations, conscious and subconscious, are responsible for a great many of man's visceral irregularities and disturbed sensations and may become, in course of time, important determining stimuli. It is a part of the function of general therapeutics and psychiatry to investigate and direct the removal or counteraction of such stimuli

RESPONSE OF NUTRITIONAL MACROCYTIC ANÆMIA TO ANAHÆMIN

BY HENRY FOY, M.A.
AND
ATHENA KONDI, M.D.

(*From the Wellcome Trust Research Laboratories, Refugee Hospital, Salonika*)

WE have found that the nutritional macrocytic anæmia seen in Macedonia responds as readily to anahæmin * as to less purified liver extracts, such as Procythol Forte and Campolon.

Wills, Clutterbuck, and Evans (1937) stated that the nutritional anæmia produced in monkeys by faulty feeding, which is regarded as the animal counterpart of nutritional macrocytic anæmia in man, is not affected by the insoluble fraction of the ammonium-sulphate precipitate of whole campolon or by anahæmin. Later Wills and Evans (1938) reported that the nutritional macrocytic anæmia of man in India is likewise unaffected by anahæmin or similar highly purified preparations They postulate the existence of an unknown factor which is active in nutritional macrocytic anæmia and is probably not Castle's extrinsic factor. They suggest that this unknown factor is active in the presence of small amounts of liver principle, either administered with or before it or previously present in the body. According to Castle's hypothesis $\left(\frac{F+G}{I} = LP\right)^{\dagger}$ responses could be obtained in nutritional anæmia by the administration of substances known, or thought to contain, the extrinsic factor. Since, however, Wills and Evans (1938) and Napier (1939) have stated that anahæmin and similar highly purified preparations are inactive in their cases of anæmia, it seems that Castle's extrinsic factor can no longer be regarded as the active factor in the cure of these macrocytic anæmias, and thus, according to their views, Castle's hypothesis is no longer tenable, at least so far as the extrinsic factor is concerned They conclude that, since highly purified extracts such as anahæmin were inactive, Castle's extrinsic factor cannot be responsible for the cure of the nutritional anæmia described by them; hence they assume the existence of some third unknown factor

The typical responses that we have been obtaining with anahæmin seem to bring the position back to that originally postulated by Castle This is further borne out by the complete absence of any response to the administration of large doses of the filtrate-factor concentrates of Edgar and Macrae Case 5 and fig. 5 show clearly that not only were the reticulocytes unaffected by large doses of the filtrate factor, but also the blood-count fell during its administration. Later the patient was given anahæmin, and the reticulocytes rose to 52 per cent. after the sixth dose, and the erythrocytes increased from 800,000 to 2,700,000 in twelve days Work on this factor is still in progress.

Addisonian pernicious anæmia does not generally respond to the administration of Marmite; it does, however, respond to anahæmin and other substances known to contain liver principle, such as campolon. Campolon contains, besides the liver principle, the filtrate factor of Edgar and Macrae (Wills's soluble fraction). By precipitation with saturated ammonium sulphate campolon can be fractionated into two parts: (1) a so-called insoluble fraction, which contains all or most of the anahæmin and anahæmin-like substances, which is active in pernicious anæmia; and (2) a so-called soluble fraction, free from anahæmin and like bodies and inactive in pernicious anæmia but active in nutritional macrocytic anæmia The presence or absence of anahæmin from the soluble fraction depends on the thoroughness of the fractionation, but, if this has been satisfactorily done and a reineckate introduced, there seems to be little possibility of any anahæmin being carried over into the soluble fraction

In our work we have dealt separately with the following substances, the composition and/or liver content of which were understood: anahæmin (B.D.H.); filtrate factor of Edgar and Macrae; Examen (Glaxo); Eluate factor (vitamin B_1); marmite; procythol forte; and varying proportions of a combination of examen and eluate factor. In this paper we are concerned only with our results from anahæmin. Papers in the course of preparation will deal with the other substances.

Anahæmin (B.D.H.) is prepared by the method of Dakin and West and during preparation is completely precipitated with 99 per cent. alcohol, is taken through two ammonium sulphate fractionations and one reineckate. It seems highly improbable that with such a method of preparation any factor corresponding to the filtrate factor of Edgar and Macrae (Wills's soluble fraction) could remain in the final product. We understand that 450 g. of wet liver forms the starting-point of the process of manufacture; this is finally reduced to 150 mg. of solid, which is taken up into 2 c.cm. of tricresol and put up in an ampoule. It follows therefore that the final 2 c.cm. of anahæmin contains the equivalent of 450 g. of original wet liver.

METHOD AND RESULTS OF TREATMENT

The cases with which we were dealing were established as macrocytic anæmia by the following criteria:—

(1) The presence of free hydrochloric acid in gastric secretion, after the injection of histamine or after an alcohol meal, in amounts equivalent to 11–92 c.cm. of decinormal sodium hydroxide per cent.

(2) Mean corpuscular volumes above 100 c.μ., as shown by the Daland and Wintrobe methods, taken at low reticulocyte level.

(3) Price-Jones curves.

(4) Bone-marrow punctures showing typical megaloblasts with finely netted nuclei and hæmoglobiniferous cytoplasm (not to be confused with late erythroblasts with their dense pyknotic nuclei and almost basophil cytoplasm, which are common in many anæmias)

(5) Colour-indices calculated from hæmoglobin estimated spectrophotometrically by the method of Heilmeyer (1933)

The responses to treatment were judged by the daily reticulocyte counts showing expected rise to maximal value, increased numbers of erythrocytes in blood-counts made every fourth day; and profound clinical improvement.

The patients on entering the hospital were given a thorough clinical and laboratory examination, and if they proved to have hyperchromic macrocytic anæmia, with reticulocytes below 5 per cent, they were observed for three to twelve days, during which daily reticulocyte counts were made. If at the end of this period the number of reticulocytes fell or remained stable, the patient was treated till the highest expected reticulocyte response had been

* The anahæmin referred to throughout this paper is that prepared by The British Drug Houses

† F = food (extrinsic factor); G = gastric (intrinsic factor); I = intestinal permeability, or factors influencing it, and LP = liver principle

obtained Treatment was then discontinued, the reticulocytes were allowed to fall to their lowest figure, and a second treatment was started with either the same or another preparation and continued till a second response had been obtained Reticulocytosis unaccompanied by an increase in the number of erythrocytes was never taken as representing a response, for many substances, notably protein derivatives, are known to bring about reticulocytosis Cases which showed constant daily reticulocyte counts varying between 8 and 12 per cent, with some regeneration of erythrocytes, were never included in our series, only cases showing the usual steep rise in the reticulocyte curve followed by regeneration of erythrocytes were selected None of the patients had blood-counts above 2,000,000, and generally we were dealing with counts below 1,000,000

In some cases the patients were treated at once after the period of observation, with anahæmin and kept on this till their reticulocytes had reached the expected maximum Treatment was then stopped, and the reticulocytes were allowed to fall to their lowest value, the patient was then treated with another preparation, and a second response was elicited In other cases treatment was begun with procythol forte, which we know from experience to be highly active in the nutritional macrocytic anæmia in Macedonia, and was continued till the reticulocytes had reached the expected maximum, all treatment was then discontinued till the reticulocytes had fallen to the lowest value, and then anahæmin was given, and a second response was obtained By such means we obtained a response not only when anahæmin was given as the first treatment but also when it was given after a known potent preparation had already produced the initial response The amounts given were 2 c.cm daily for three to nine days, and the maximal reticulocyte response took place about the fourth to ninth day after the start of treatment

We have also treated patients with the filtrate factor concentrate of Edgar and Macrae, and case 5 and fig 5 make it clear that no response whatever can be elicited with this factor Later the same patient was treated with anahæmin, and a characteristic response was obtained Work on this factor is still in progress

It is not intended here to give full details of all the case records We have, however, outlined five typical cases All our patients were females and mostly in the last six months of pregnancy In a forthcoming paper we shall describe cases of hyperchromic macrocytic anæmia in males, which is extremely common here In some of these males

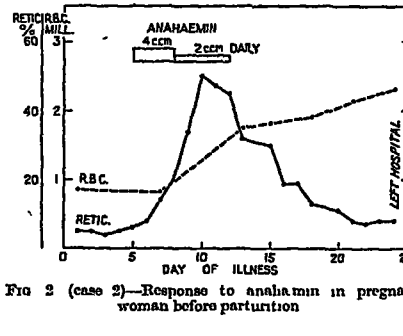

FIG 2 (case 2)—Response to anahæmin in pregnant woman before parturition

typical megaloblasts are found in the sternal marrow, and there is always a great activity of the marrow, nearly all have large spleens and a high indirect Van den Bergh reaction and free hydrochloric acid in the gastric secretion, but none of them respond to intramuscular liver therapy, no matter what preparation is used Apart from the large spleen there is no evidence of malaria in either the bone-marrow or the peripheral blood, but as a routine all such patients are given quinine hydrochloride 2 grammes daily for five days, to ensure clearing up any latent malaria so far as possible There was no sign of abscesses in any of the cases, and the Wassermann reaction was always negative

Information given by the patient about her diet, which we regard as a most unsatisfactory method of ascertaining details concerning dietary, reveals a diet which appears to be adequate in vitamin C, but saturation tests with Redoxon (Roche) show in many cases a considerable deficiency We are aware that in pregnant women the vitamin C stores are likely to be depleted (Teel, Burke, and Draper 1938) but we have found this deficiency also in men So far very little is known about the vitamin C content of the fruits and vegetables in Macedonia, and, since it has been shown that vitamin C content to some extent depends on the condition of the soil, methods of storage, and freshness (Bessey 1938) it is possible that the dietary is not a good index of vitamin C intake in Macedonia So far no data are available for normal levels of vitamin C in Macedonia

Percentage hæmolysis tests, done by the methods of Simmel and Creed and read in the latter case spectrophotometrically, showed that alterations in the resistance of the red cells were not constant We are not, however, at all satisfied with fragility tests as at present carried out and feel that from the quantitative aspect they leave very much to be desired

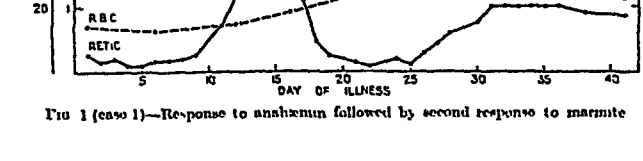

FIG 1 (case 1)—Response to anahæmin followed by second response to marmite

CASE RECORDS

CASE 1 (fig 1).—A multipara, aged 35, eight months' pregnant, entered hospital for weakness and anæmia Well nourished body; spleen palpable Tongue, teeth, and nails normal No œdema of legs, ankles,

or face. Icteric tinge to skin and conjunctiva. Breathless and obviously very ill. Liver normal. Reflexes normal. No petechiæ or history of nose-bleeding or abnormal menses.

Laboratory examination, April 22, 1938 :—

Red blood-cells (R B C) 710,000 (± 3 per cent) per c.mm.	Mean corpuscular volume (M C V) 117 c μ
Hæmoglobin (Hb) 3·2 g per cent (Heilmeyer), 3·3 g per cent (Newcomer)	Mean diameter of approximately 1,000,000 R B C (Pipjer) 8 3 μ
Colour-index (C I) 1·6	White blood-cells (W B C) 4620 per c mm
Hæmatocrit 8·3 per cent.	Reticulocytes 4 per cent.

Bilirubin: direct negative; indirect 1·8 mg per cent
Bone-marrow: low activity; pathological granulocytes, few typical megaloblasts, early and late erythroblasts
Gastric test: free hydrochloric acid after histamine

CASE 2 (fig. 2).—A multipara, aged 30, eight months' pregnant, entered hospital for weakness and breathlessness. Body well nourished. Icteric tinge to skin and conjunctiva. Tongue, nails, and teeth normal; reflexes normal. No petechiæ or history of nose-bleeding or abnormal menses. Liver normal. Spleen II (Hackett). No œdema.

Laboratory examination, Jan. 3, 1939 :—

R.B C 847,000 (± 3 per cent) per c.mm.	M C V 117 c μ.
Hb 3·7 g per cent (Heilmeyer), 3 7 g. per cent (Newcomer)	Pipjer 7·9 μ

Bone-marrow · typical megaloblasts; early and late erythroblasts, pathological neutrophils and plasma cells, very active marrow
Gastric test: free hydrochloric acid after alcohol meal

DISCUSSION AND SUMMARY

Nutritional macrocytic anæmia, as seen in Macedonia, responds as readily to highly purified preparations, such as anahæmin, as it does to the

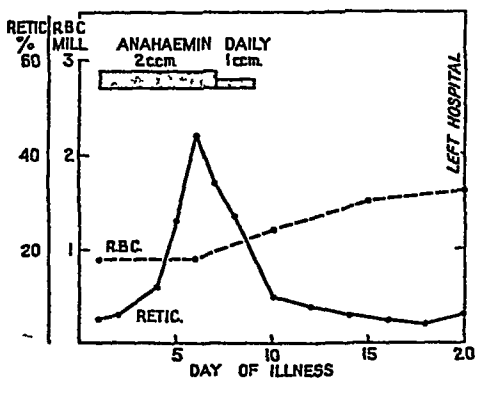

FIG. 3 (case 3)—Response to anahæmin in pregnant woman before parturition

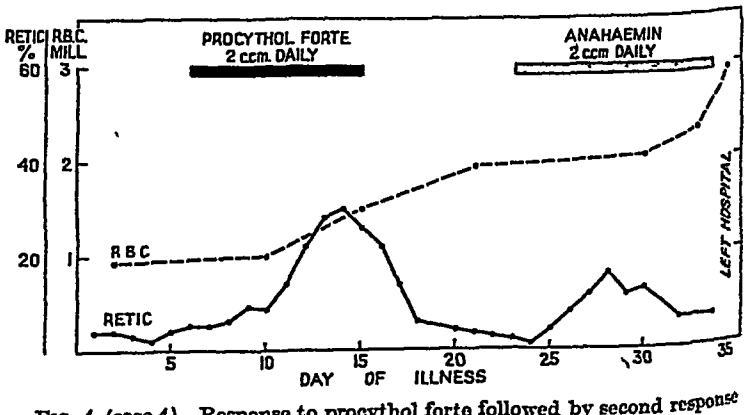

FIG 4 (case 4)—Response to procythol forte followed by second response to anahæmin.

cruder liver preparations, such as procythol forte and large doses of campolon This response to anahæmin in Macedonia is in contrast to the cases treated in India and suggests that the Macedonian cases differ from those in India, where a high indirect Van den Bergh reaction is rare, glossitis is common, and the highly purified liver preparations are inactive Such responses to these highly purified extracts make it appear unlikely that the filtrate factor of Edgar and Macrae is the active one in the cure of nutritional macrocytic anæmia in Macedonia

Further, work done with the filtrate factor concentrate shows that this, administered alone, is inactive even when given in large doses The case-records given here show that during treatment with this substance not only did the reticulocytes not increase but also the blood count fell Later the patient responded to anahæmin with a maximal reticulocytosis of 52 per cent followed by regeneration of the erythrocytes

It is not impossible that the response to anahæmin is quantitative and related to the liver content In this respect it is interesting to note that responses to campolon, which contains the equivalent of 10 g of wet liver per 2 c cm , can only be obtained if very large doses (8–12 c cm daily) are given, and that procythol forte, which contains the wet liver equivalent of 100 g , is active in 2 c cm doses Anahæmin is active in 2 c cm doses and will probably be found active in smaller doses

Although the quantitative aspect is important, it is probable that the qualitative aspect also enters into the picture, for work now in progress seems to show that large amounts of filtrate combined with very small amounts of anahæmin are extremely active

This work suggests that the conclusions drawn by Wills and Evans (1938) and Napier (1939) do not apply to the nutritional macrocytic anæmia as seen here, for we obtain typical responses to anahæmin Further, the suggestion that there is *some active* principle present in the filtrate *factor is not* borne out by work with filtrate factor concentrates, which do not produce any effect on the anæmias here Such findings appear to bring back the position to that originally postulated by Castle

The regeneration of the blood in our cases is not always adequate, and we consider that this is probably due to an intercurrent destruction of blood, which may also be responsible for the relatively large doses of liver extract required In this connexion we think that doses effective in pernicious anæmia are not necessarily any guide to what may be adequate doses in nutritional anæmia The large spleens often present in our cases and the relatively high Van den Bergh reactions may suggest that underlying malaria and hypertrophy of the reticulo endothelial system may also be a factor in the large doses required, but we have no evidence that smaller doses are beneficial in cases with low indirect bilirubin values and small or non palpable spleens

A hyperchromic macrocytic anæmia, associated with large spleen, very active marrow, which occasionally contains megaloblasts and free hydrochloric acid in the gastric secretion, is very common in males in Macedonia and, so far as we can at present ascertain, responds to no intramuscular liver preparation that we have so far tried

Some of our cases both in males and in females, show vitamin C deficiency after saturation tests with redoxon (Roche), although from a history of the patients' dietary no vitamin C deficiency would have been suspected

We have recently carried out an anæmia survey in the island of Cyprus and have been extremely surprised to find that the predominant anæmia there is hypochromic microcytic in contrast to Macedonia, where the predominant anæmia is hyperchromic macrocytic The dietary survey showed that there were considerable differences between the consumption of meat in Cyprus and that of Macedonia, in the former more meat being eaten, there is a low consumption of green vegetables in Cyprus compared with Macedonia A full report of our Cyprus findings will be published later

TREATMENT OF EPILEPSY WITH EPANUTIN

By Donald Blair, M B Camb , D P M

ASSISTANT MEDICAL OFFICER AT CANE HILL MENTAL HOSPITAL, COULSDON, SURREY

K. C Bailey, M B Camb , D P M

AND

J S McGregor, M B Glasg

ASSISTANT MEDICAL OFFICERS AT WARLINGHAM PARK HOSPITAL

In experiments on animals Putnam and Merritt (1937 and 1938a) investigated the anticonvulsant properties of many drugs, and found that sodium diphenyl hydantoinate was a strong anticonvulsant and weak narcotic Later they tested it on human beings (Merritt and Putnam 1938b) with good results, and the drug has since been marketed as Dilantin in America and Epanutin (Parke Davis) in this country Apparently it is now used fairly widely, but no publication other than that of Merritt and Putnam (1938b) has yet dealt with any large number of cases

The material used in our own investigation consisted (like Merritt and Putnam's) of chronic cases male cases at Cane Hill and Warlingham Park mental hospitals and female cases at Warlingham Park only, making a total of 53 male and 22 female The cases were unselected except for the exclusion of a few patients too feeble to warrant a change from their usual sedatives They were all subject to grand-mal attacks, and the investigation was limited to this form of fit alone, for the difficulties in determining the number of petit mal attacks in this type of patient were such as to render accurate conclusions impossible, and such attacks were rare Of our 75 patients 58 have been treated continuously for two to six months, and 52 of these more than three months In 11 cases it has been necessary to terminate treatment and 6 recently admitted patients have not yet received two months' treatment

Merritt and Putnam's 118 patients with grand mal, of whom only 59 were free from petit mal or what they term "epileptic equivalents," had received treatment for more than two months and most of them for less than six months They had previously been treated with bromides or with phenobarbitone and so had most of ours, with the addition of chloral or Prominal in a few cases

The object of our investigation was to determine the anticonvulsant effect of epanutin as compared with other anticonvulsants, such as bromide or phenobarbitone; whether any mental effects were produced by the drug; its *toxicity*; and the best method of change-over to this form of treatment

ANTICONVULSANT EFFECT

Our findings confirm those of Merritt and Putnam—namely, that the drug is a strong anticonvulsant, its action sometimes being dramatic. Table I shows our results in detail and table II compares Merritt and Putnam's figures for grand mal with *ours* As regards complete remissions our figures do not equal those of Merritt and Putnam who, however, do not state the period over which complete relief was obtained, and our material was probably more chronic

TABLE II—EFFECTS OF EPANUTIN ON GRAND MAL IN THE PRESENT SERIES COMPARED WITH RESULTS OF PUTNAM AND MERRITT

Effect on frequency of attack of grand mal	Merritt and Putnam's (1938b) series (118 cases)	Present series (58 cases)
Complete relief ..	29 (49·1 %)	23 (39 6%)
Great decrease ..	14 (23 7 %)	12 (20 6%)
Moderate decrease ..	6 (10 1 %)	5 (8 6%)
No change	10 (16 9 %)	4 (6 8%)
Increase . ..	Not mentioned	14 (24 1 %)
Total	59	58

Putnam and Merritt do not state exactly the meaning of their terms We have adopted the following criteria —

Complete relief=no fits during last six weeks.

Great decrease=reduction by more than a half
Moderate decrease=any reduction smaller than a half.
} Compared with a similar period before treatment

than theirs Both in our series and in theirs the period of observation was comparatively short, as they remark, "it is probable therefore that many of the patients in the completely relieved groups will later be transferred to other groups, but it is possible that greater experience with the use of the drug will *make it possible to obtain better results* in some of the cases in the moderately or greatly improved groups."

The criticism may be offered that certain of our patients having a large number of fits were being inadequately controlled before the treatment with epanutin. Most of them, however, had been under observation for many years and, after a trial of various drugs and different doses, had been given that most suited to them. Similar great reductions in the number of fits are instanced by Merritt and Putnam, who cite a patient having two or three fits a day on luminal gr. 6 who was completely relieved of attacks from the start of treatment with dilantin; and by Coope (1939), who mentions several cases of multiple fits much reduced by epanutin. Table I shows that some patients had few fits before epanutin was given; these have been included to illustrate the efficiency of epanutin as compared with that of the previous medicine in keeping their fits down.

The anticonvulsant effect of epanutin is recorded graphically in 3 separate cases in fig. 1. In the 51 patients on treatment for over two months the total number of fits a month are recorded in fig 2, which shows the reduction under epanutin as opposed to previous medicines. In certain cases the number of fits increased immediately after the change of treatment, but was later reduced without the dose being increased. This appears to be important, for, if it is not recognised, a false idea of the controlling action of epanutin may lead to its discontinuance In 3 cases, at first well controlled with epanutin, there was a sudden bout of fits in rapid succession four to six weeks after the treatment had been started which led to withdrawal of the drug. In 1 patient, at first well controlled, status epilepticus developed after he had been on epanutin for four months

Merritt and Putnam have described cases in which epanutin did not control the fits so well as other sedatives In our series 14 patients had an increase of fits, although mostly only slight Sometimes, in spite of the fits being controlled, the occurrence of auræ tended to persist and the patient appeared to be more conscious of these than previously

MENTAL EFFECTS

Apart from the reduction in the number of fits, there is little doubt that epanutin is beneficial to the mental condition of many patients The patients being chronic psychotic epileptics, there was little room for intellectual improvement, but a beneficial modification of the typical epileptic temperament was often observed From our observations and those of the nursing staff we are convinced that up to the present most of the patients have improved mentally, being more cheerful and congenial, less quarrelsome and complaining, and more easily managed and occupied In some cases the effect has been remarkable One patient, who was being treated with phenobarbitone and was in a semi stuporose condition, is now completely relieved of both fits and stupor, and another patient, who was so aggressive that his relations feared to visit him, now enjoys Sundays at home with them Detrimental changes may, however, develop in association with toxic effects, and whenever a patient's mental condition appears worse chronic poisoning should be suspected

TOXICITY

The question of the toxic action of epanutin is one of great importance A note of caution has already been sounded by Schlesinger (1938, 1939), who also points out the chemical resemblance between epanutin and Nirvanol (Poynton and Schlesinger 1929) and refers to his own experience of the toxicity of nirvanol Lennox (1938) maintained, however, that epanutin cannot be considered in the same category as nirvanol with regard to toxicity

Merritt and Putnam (1938b) noted the following toxic symptoms (1) slight giddiness, ataxia, tremors, blurring of vision, and diplopia from the third to tenth day in 15 per cent of cases, (2) various erythematous, morbilliform, and scarlatinal rashes, and (3) more serious skin lesions and changes in the blood on the ninth and tenth days, including one case of exfoliative dermatitis and one of purpura They found that reduction of the dose alleviated the first

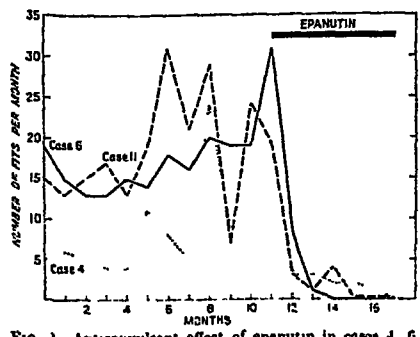

FIG 1—Anticonvulsant effect of epanutin in cases 4, 6 and 11 (see table I)

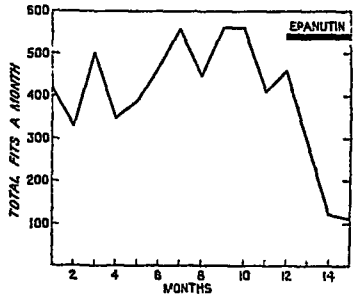

FIG 2—Total number of fits a month in 51 epileptics before and during treatment with epanutin

two groups of symptoms, and that the dose could usually be increased later without causing a renewal of the symptoms

Epanutin.—The incidence of nervous and mental symptoms in our cases was as follows —

Giddiness	4	Hallucinations	3
Tremor	3	*Prolonged confusion*	3
Ataxia	4	Clonic spasms	2
Blurring of vision	1	Much agitation	2
Diplopia	0	Mental depression	2
Slight nausea	3	Reactivation of suicidal tendencies	1
Delusions	3		

These figures do not represent the number of patients showing toxic symptoms for two or more symptoms often developed in the same patient

These symptoms, except the first five, are not described by Merritt and Putnam (1938b) There seems little doubt that they were due to toxic effects, for they had seldom been present before the start of treatment with epanutin and, if so, only in a mild form, and when the drug was withheld they disappeared The resemblance of these mental symptoms to those described by Willcox (1927) lends added probability of their toxic origin, for this drug has much in common with the barbiturates as regards toxic effects on the nervous system

Although most of the nervous complications in our cases developed during the earlier days of treatment they were not confined to the first ten days like those described by Merritt and Putnam Three patients who appeared normal during the first few weeks of treatment later developed attacks of confusion that were more severe and prolonged than those experienced on their previous medicine That this was due to too much rather than too little epanutin is shown by the fact that an additional capsule exaggerated the symptoms and produced a reeling gait Subjective sensations—e.g. difficulty in seeing and stiffness of the jaw—and clonic spasms of various muscles developed in certain cases A severe skin reaction was seen in only one case, a man who had an attack of acute bronchitis and coryza on the fourth day of which he developed a morbilliform rash followed shortly by pyrexia The absence of Koplik spots ruled out the diagnosis of measles and the symptoms corresponded very closely to those caused by nirvanol

Merritt and Putnam found no abnormality in their patients' blood and most of ours revealed no change, although an occasional leucopenia with a relative lymphocytosis was found; but we do not attribute these changes to the drug, because Patterson and Wingrow (1929) found similar changes in

idiopathic epilepsy. This change has been described in association with nirvanol. Although albuminuria has not been found, an alkaline reaction has been noted in specimens of urine collected before meals and most often in morning specimens. No blood-pressure changes attributable to epanutin were found. Sponginess of the gums resulting from this drug has been described by Kimball (1939) Our hospital dentists, however, could find it in only two cases in which it could be in any way attributed to the drug.

It is convenient here to mention a patient (case 35) who, although previously having an average of ten fits a month, had no fits for ten weeks on epanutin and showed much mental improvement, willingly employing himself and being altogether more pleasant. Recently, however, he has had a bout of confusion more prolonged than ever before The question therefore arises as to the benefit of producing a complete cessation of fits in all epileptic patients.

DOSAGE AND CHANGE-OVER

The avoidance of toxic effects, the best method of changing from previous drugs to epanutin, and regulation of dosage are three important matters The change-over from luminal or bromide to epanutin requires care; to find a standard method we divided the cases into three groups, completing the change rapidly in the first, less rapidly in the second, and slowly in the third In group 1 one capsule (0 1 g) of epanutin was substituted for a dose of luminal or bromide, regardless of the quantity of that dose, and in groups 2 and 3 the change was effected on the basis of 0 1 g. of epanutin to each 0 1 g. (gr. 1½) of luminal or gr. 15 of bromide or chloral In group 1 one capsule was substituted for one dose of the previous medicine until on the third day a complete change was effected, so that patients who had been receiving their previous medicine three times a day were now receiving only one capsule of epanutin three times a day In groups 2 and 3 longer intervals were allowed before the second and third capsules were given. It was found that nearly every case required a minimum of one capsule three times a day, no matter how small a dose of the previous medicine had been taken. No difference in toxic effects or ability to control the fits was noted in the three groups. Some cases required later additional capsules, the maximum we have given being six capsules in the day Patients who require a large amount of bromide or of luminal to control their fits usually require a large dose of epanutin (see table I, cases 42 and 50), although no definite correlation can be established

In some cases there appears to be little relation between the previous dosage and the amount of epanutin required to produce a corresponding control of the fits. This is illustrated by two cases; one patient, who was in a state of semi-stupor on gr ½ of luminal thrice daily, had his stuporose condition and fits completely relieved by epanutin 1 capsule thrice daily, and the other patient, an epileptic who had been kept free from fits with gr. 1 of luminal at night, began to have fits and to be confused when he was given epanutin 1 capsule each day.

The individual response to epanutin appears to be variable, some cases responded miraculously to three capsules in the day, whereas others required a toxic dose to reduce their fits In most cases a standard controlling dose was soon reached, but in some cases the fits increased several weeks later, as already described, suggesting that there might be decreased tolerance or late toxic effects

The method of substitution which we have now adopted is to replace one dose of the previous drug with one capsule of epanutin every other day until on the sixth day the patient is having epanutin alone. If the patient is on four doses of the previous medicine, this dose is omitted on the eighth day Thereafter, unless there is an increase of fits, a larger dose of epanutin is not given until after the fourteenth day, for it is mostly during this time that toxic symptoms appear. In some cases fits tend still to continue at night when the capsules are given three times a day before meals as advocated, and it is then necessary to give the third capsule later in the day or to add another capsule before bedtime.

CASE-RECORDS

CASE 35.—Male, aged 37. Past treatment: sodium luminal gr. 1 thrice daily (t d.s.). Past fits a month: 10, 7, 11, 9, nearly all nocturnal. Mentally dull with a typical epileptic temperament with frequent complaints and suspicion. Epanutin started March 9, 1939, and thereafter fits a month were 15, 1, 0, 0. Mentally much improved, being more cheerful.

May 13: onset of persistent confusion, which increased gradually, although he was less suspicious and aggressive than in previous confusional attacks. This attack of confusion was more prolonged than any he had had while having fits. The desirability of eliminating fits entirely is thus questioned.

CASE 60.—Male, aged 60. In hospital since 1914, on luminal gr. 2 twice daily (b.d.) Past fits a month: 0, 2, 2, 0, mostly diurnal. Mentally childish, self-satisfied, and religiose. Epanutin started on March 16, 1939, 1 capsule t.d.s Subsequent fits a month, 2–5. No mental change noted.

April 11: sensation of uselessness of right arm. Disappeared by next day. May 1: sensations of impaired vision, stiffness of jaw, and a feeling of being gassed Epanutin stopped and luminal given. May 2: improved and back to his previous mental condition.

CASE 56.—Female, aged 39. Ten fits a month with bromide. Epanutin started on Jan. 10, 1939, 1 capsule b.d., increased to 1 capsule t.d.s Fits persisted but fewer until in May only one fit until the 20th, when sudden onset of status epilepticus, which was controlled by paraldehyde per rectum.

CASE 36.—Male, aged 28, average fits a month 6 Epanutin started on Jan. 31, 1939. Fits controlled, but exactly seven days after starting epanutin the patient developed acute bronchitis. Coryza and a morbilliform rash appeared on the trunk on the tenth day and spread to the limbs. The temperature rose during the next few days to 105° F., and the patient became stuporose. The cerebrospinal fluid and urine were normal, but there was a mild leucopenia (white cells 4800) with a relative lymphocytosis. Epanutin was stopped, and the patient made a slow but steady recovery. Epanutin was again given cautiously with no further untoward symptoms.

CASE 52.—Female, aged 41. Epanutin started on Jan. 31, 1939. Two weeks later she complained of giddiness, and a week later was stuporose and pale and had a weak and thready pulse Blood and casts were found in her urine. Although she was only having three capsules of epanutin a day, the nephritis was considered to be due to the drug, which was discontinued, whereupon the condition rapidly subsided.

CONCLUSIONS

Our conclusion that epanutin is a strong anti convulsant with a proportionately small depressant effect confirms Merritt and Putnam's work Our results regarding the reduction of fits are not so good as those obtained by them, but this may be due to the chronicity of our cases The development of late toxic symptoms has not been sufficiently emphasised by them, and we have no evidence that at even a

later date other toxic symptoms may not appear We agree with Merritt and Putnam that this drug is more toxic than many other of the common anti convulsants and emphasise the apparent idiosyncrasy to its action and the necessity for caution in its use

SUMMARY

(1) An investigation was undertaken to ascertain the action of sodium diphenyl hydantoinate (epanutin) on a large series of epileptics (53 male and 22 female) in mental hospitals

(2) The anticonvulsant properties of epanutin were confirmed and compared with those of luminal, prominal, bromide, and chloral The action of epanutin was superior to that of these drugs in many cases, but in others it appeared to be inferior

(3) Mental improvement was observed in most of the patients, the typical epileptic temperament being considerably improved and the patients becoming more congenial and more easily nursed and occupied

(4) The importance of the toxic action of this drug is emphasised Many cases exhibited toxic nervous symptoms, but only one developed a rash These toxic symptoms often developed after an increase in the dose

We are indebted to Drs G A Lilly and T P Rees, medical superintendents of Cane Hill and Warlingham Park mental hospitals respectively, for permission to publish this paper and for the interest they have shown, and to Mr N B Coltart and Dr G Lyle, dentists at the two hospitals respectively, for their opinions

EPANUTIN IN EPILEPSY

By JOHN P STEEL, M D Edin

MEDICAL SUPERINTENDENT OF SMITHDOWN ROAD HOSPITAL, LIVERPOOL AND

L SEYMOUR SMITH, M D Lpool

DEPUTY MEDICAL SUPERINTENDENT OF THE HOSPITAL

Merritt and Putnam, in their article on the treatment of convulsive disorders,[1] conclude that the use of sodium diphenyl hydantoinate (known in this country as Epanutin) should be restricted for the present to "that group of patients which does not respond to the less toxic forms of therapy in common use" Practically every epileptic of any length of standing has been subjected to most of the drugs used to depress excessive nervous excitability, and what is satisfactory in one case repeatedly turns out to be of little or no use in most In dealing with the epileptic without mental deterioration it must never be forgotten that, though the benefit from a drug may be due largely to its sedative effect, the psychological value of a new treatment in which the patient is educated to have faith has to be considered, it is therefore somewhat difficult to assess the real value of any drug For this reason it has seemed desirable to deal with a series of cases of long standing and known degree of convulsive seizures in which there may be fairly said to be sufficient epileptic deterioration to discount the psychological aspect of any treatment, it has been possible to do this at Smithdown Road Hospital, Liverpool, over a large number of cases, of which 20 have been selected for report

Coincident with the treatment of "chronic" epileptics, epanutin has been used on the more acute or less deteriorated cases, and a further report will be submitted at the end of continuous observation on the value of the drug in such cases

TREATMENT

We expected that the most that epanutin could produce was an amelioration in, and a reduction of, the number and severity of the seizures in some cases A true comparison of its probable value seems to demand that the epilepsy be of long standing, and that long periods of observation and careful records should be available to contrast with the results obtained with other drugs The 20 cases selected fall into the following classification of observation —

Ten years or over	3
Five to ten years	7
Two ,, five ,,	7
Under a year	3

Continuous notes have been kept of the seizures under all the drugs used and of the patients' social and mental conditions In the accompanying table the average number of fits can be taken as a fair indication of the condition on admission In certain cases all treatment was withdrawn some time after admission but the length of time allowed to elapse between the changing of medication is quite sufficient to ensure that there were no residual effects of previous drugs

Cases 18 and 20 have not the same period of observation that the others have, but they have been included as being established epileptics with a long history of varied treatments outside Case 10 shows the result of therapy with epanutin alone

Treatment of epilepsy with any drug is based on finding the minimum which will control the seizures, and this has been attempted in all the cases instanced From time to time the dose has had to be varied, but gr 15 of potassium bromide twice daily is an average, Prominal gr 1½ has been taken as the minimal dose and increased up to gr 4½ as a maximum, and Luminal gr 1 twice daily has been given in solutions, and this has rarely been exceeded, the solution being freshly prepared daily Endeavours have been made to time the giving of drugs in anticipation of any known time incidence of seizures

RESULTS

The accompanying table seems to uphold the statement that epilepsy reacts in different ways to different drugs, and that no drug can be considered specific, nor is any one certain to act in most cases when given in reasonable therapeutic doses It is obvious that, where the standard dose is safely exceeded, the depressing effect may readily keep the seizures below the ordinary normal limit, with perhaps a consequent physical reaction to the detriment of the patient in general

Merritt and Putnam show over a very large series of cases that of the major epileptics treated with the drug under its American name of Dilantin 58 per cent

Notes—Treatment *a*, 3 months, *b*, 6 months, *c*, 9 months, *d*, 12 months, *e*, over a year
A, tremor of legs, which disappeared after "rest" and *did not* recur when epanutin was given again AA, ditto, but *did* recur. F, tremor of legs, which was intermittent FF, long-continued generalised muscular irritability B, dizziness C, transient nausea D, rash without fever DD, recurred rash E, painful and tender gums EE, ditto, which disappeared after "rest" but recurred when epanutin was given again

obtained *complete* relief and 27 per cent. showed a considerable remission. These workers were apparently dealing with the younger and more recent cases of epilepsy, whereas we are considering the very long-established epileptic with definite mental defect, and over the small number cited here the results seem to be less successful

Considerable diminution in number of seizures ..	6
Slight ,, ,, ..	6
No change in number of seizures ..	5
Increase ,, ,, ..	3

Although the foregoing figures appear to show that in 12 of the cases epanutin has been more successful than other drugs, the same proportion (60 per cent.) of successful results cannot be expected over a large series of cases or over a long period of time, for disappointing relapses are by no means uncommon and epanutin has had to be discontinued for this reason. Two of the patients cited as showing considerable diminution have deteriorated mentally, and two others showed repeated temporary confusion and excitement.

Blood-counts have been taken for the purpose of comparison but hardly give any definite information, except that there is a tendency to an increase in the hæmoglobin percentage in 10 cases, leucopenia in 6, and leucocytosis in 7. The small leucocytes are increased in 6 cases and the eosinophils in 4, case 6 showing an increase of both

COMPLICATIONS

In 13 of the cases some complication followed the administration of epanutin—chiefly dizziness, transient nausea, painful and tender gums, and a rash generalised over the body. All of these readily responded to treatment when the drug was stopped, and they gave no cause for alarm In this connexion it is perhaps advisable to point out that, when epanutin is given before food, there is a greater liability to a feeling of nausea, and it is our practice now to give it with a drink of water at the end of a meal. One or two cases have shown long-continued generalised muscular irritability, and it is of interest to note that in these cases the tendency to the replacement of the major by the minor epileptic fit has been particularly noticed Our experience is that, where intolerance of the drug is found, it is well worth while to discontinue it for two to four days and not to give any of the barbiturate group of sedatives in the meanwhile At the end of that time it is usual to find that the toxic symptoms are receding, and the drug can be administered again in the same or in a reduced dose; in several of our cases the complications returned in a mild form until the minimal tolerated dose was found No urinary complications have arisen

CONCLUSIONS

Admittedly the cases cited, though few, are a severe test for any drug; they were selected for that reason. We wish to emphasise that our experience is that epileptic attacks respond in a strange manner to drugs in different patients We do not know of anything which will, in therapeutic doses, react in a similar fashion on every patient, and we know of no specific; so far our experience of epanutin in the chronic case is that some patients respond thereto who responded less or not at all to the other sedatives. Again, some patients do not immediately tolerate the drug well, toxic manifestations, such as dizziness, gingivitis, tremor of the hands, and altered gait, are not uncommon; but they are not severe if the dose is carefully graded, or if the drug is withdrawn altogether for three or four days None of our cases showed a temperature with the rash

It has been noticed that cyanosis is greater in seizures under epanutin than under the ordinary drugs, and the seizures tend to be more severe

It is, we think, fair to say that epanutin has in some cases diminished the frequency of the seizures At the same time, the total number of fits has been but little affected The drug seems to have a sedative action on the incidence; in other words, it is common to find that the patient, instead of having fits every day, goes eight to ten days without any attack and then has several in close succession

We have given 0·1 g in a capsule twice or thrice a day, and in no case has the latter dose been exceeded The results have been sufficiently favourable to warrant an extended trial, and in the younger and less deteriorated epileptics it seems that tolerance to epanutin and the benefits therefrom are at least as good as with the other barbiturates. It is too early to discuss cases which have not been under long continuous observation, because too much reliance has to be placed on the history supplied; but we think that at present the drug provides in some cases

a means of reducing for a time the total of seizures, and, given in non toxic doses, it leads to amelioration in some cases where other drugs have not, two at least of the patients have shown definite mental deterioration, and others show increased confusion after the fit

IDIOSYNCRASY TO ACRIFLAVINE

FAILURE TO TRANSMIT BY BLOOD TRANSFUSION, AND REACTIONS TO ALLIED DRUGS

BY W A YOUNG, B M Oxfd, B Sc Lond, D T M & H

SENIOR MEDICAL OFFICER, SEWA HADJI HOSPITAL DAR ES-SALAAM TANGANYIKA TERRITORY

IT has now been possible to conduct further investigations into the case of idiosyncrasy to acriflavine previously recorded [1]

The Indian was readmitted into the Sewa Hadji Hospital on Oct 25, 1938 The persistence of his idiosyncrasy was proved by the application to his forearm for forty eight hours of a small pad of gauze soaked in a 1 in 2000 solution of acriflavine On the day after the removal of the pad local itching was experienced and slight redness developed at the site of the dressing Next day the area presented a surface of small papules, reminiscent of a nutmeg grater, which persisted to Nov 18 On Oct 28 14 oz of the patient's blood was transfused into an anæmic African patient who had been proved not to have an idiosyncrasy to acriflavine Thereafter the recipient of the blood was tested for his local skin reaction to acriflavine with pads strapped on various parts of the body for forty eight hours at a time, the first pad being applied on the day of the transfusion and the others at two day intervals for a fortnight after the transfusion and again one month after the transfusion At no time during this period did the recipient show any local skin reaction to acriflavine

REACTIONS TO ALLIED DRUGS

To investigate the extent of the idiosyncrasy of the Indian towards drugs of chemical constitution allied to that of acriflavine, various patch tests were carried out with small dressings strapped to the skin for twenty four hours and soaked in 0 05 per cent watery solutions of Atebrin pro injectione, eosin, fluorescein, safranin, acridine hydrochloride, Gonacrine, and Rivanol

Atebrin and *eosin* were tested simultaneously on different areas of the body On the fourth day the area that had been under atebrin showed a roughened surface similar to that produced by acriflavine but less pronounced, the papules being rather less prominent Itching was experienced as after the acriflavine The area that had been under eosin became very slightly roughened on the fourth day but was normal again by the sixth day There were no reactions with similar tests in controls *Fluorescein* caused a local reaction of intensity greater than that after eosin but less than that after acriflavine When *acridine hydrochloride* was applied, the patient immediately complained that it was stinging him, though no unpleasant sensation was experienced by the dresser, who applied some to his own skin Not even erythema, however, was noticed at any time after removal of the acridine patch test *Safranin* caused merely a slight local erythema on the fourth day *Gonacrine* produced a roughened surface similar to that given by atebrin but as early as the second day—i e, the "nutmeg grater" surface was already developed when the dressing was removed after forty eight hours *Rivanol* gave no reaction

The intensity of reaction for the drugs may be placed in the following order acriflavine, atebrin, gonacrine, fluorescein, eosin, safranin, acridine hydrochloride, and rivanol Their chemical relationship is shown by the accompanying formulæ, kindly supplied by *Mr W D Raymond, the Government analyst*

REDUCTION OF REACTION TIME

In view of the early reaction to gonacrine, it was decided to apply a final patch test of acriflavine to see whether a general hastening of the reaction time to the group of drugs had developed A dressing was applied on Nov 16 When it was removed after forty eight hours, the usual rough surface had already been produced The lag of forty eight hours in the reaction to this drug had therefore disappeared The reaction also proved eventually to be of much greater intensity on this occasion, severe confluent pustulation developing after a few days and necessi

Acridine

tating the patient's readmission to hospital on the 24th On Nov. 18 a "nutmeg-grater" surface still persisted at the site of the acriflavine test of Oct. 25, and a faint stain could be detected at the site of the earlier test in June

I am indebted to the director of medical services, Tanganyika Territory, for permission to publish this paper.

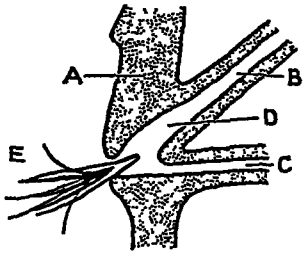
ACUTE PANCREATITIS CAUSED BY A BARLEYCORN

BY FRANK FORTY, M.B Lond., F.R.C.S.
SURGEON TO REDHILL COUNTY HOSPITAL, EDGWARE

ACUTE hæmorrhagic pancreatitis is in many instances associated with gall-stones In consequence, biliary obstruction or infection of the biliary system is generally held to cause the pancreatitis. Special interest therefore attaches to those exceptional cases of acute pancreatitis which are not associated with gall-stones or any demonstrable pre-existing lesion in the biliary tract. Only occasionally in such circumstances is some definite mechanical cause discovered, as in the cases published by Rigby (1922–23) and Novis (1922–23), in which a roundworm was found in the pancreatic duct, and in the case reported here, in which the outlet of the ampulla of Vater was obstructed by an impacted barleycorn

CASE-RECORD

A housewife, aged 68, was admitted to Redhill County Hospital on Dec. 2, 1938. She had vomited at 3 P.M. on the previous day, and soon afterwards severe pain started in the upper abdomen and persisted throughout the night, becoming localised somewhat in the right side of the abdomen and radiating to the right shoulder. There was no further vomiting, but there were periodical eructations of bitter fluid. In the past she had had occasional attacks of pain in the right iliac fossa, and she had also been troubled by some indigestion



Barleycorn impacted in ampulla of Vater. A, duodenal wall; B, common bile-duct; C, pancreatic duct; D ampulla of Vater; E, impacted barleycorn.

On examination she was a fat woman, obviously in severe pain and perspiring freely. Her temperature was 97° F. and her pulse-rate 96 Her tongue was clean The abdomen was distended and tense, and it was very tender in the right hypochondrium and in the right iliac fossa.

Operation.—On the day of admission I performed a laparotomy under general anæsthesia, opening the abdomen by a supra-umbilical right paramedian incision The peritoneal cavity contained much dark-brown bloodstained fluid, and there was obvious fat-necrosis of the omentum. The pancreas was enlarged and felt abnormally hard. The gall-bladder appeared perfectly normal; its wall was thin and its peritoneal coat healthy and free from adhesions. No gall-stones could be felt in the gall-bladder or in the common duct. Acute hæmorrhagic pancreatitis was diagnosed, and the abdomen was closed with drainage. The patient died a few hours after the operation.

Post-mortem examination.—The following is an extract from Dr. Hamilton Patterson's notes on his post-mortem examination. The gall-bladder was normal. The common bile-duct was not dilated. No gall-stones were present. The opening of the ampulla of Vater into the duodenum was obstructed by a barleycorn, the pointed end being embedded in the ampulla and the whiskers sticking out into the duodenum (see figure). Bile could be squeezed from the gall-bladder into the duodenum with some difficulty. The head of the pancreas was hæmorrhagic and was hard and rubbery to the touch. Extraperitoneal fat round the pancreas and in the great omentum showed many spots of fat-necrosis There was some blood in the peritoneal cavity, and the coils of small intestine were stuck together. Microscopical sections showed acute necrosis of the pancreas and advanced fatty change in the liver.

DISCUSSION

The case reported here has, I believe, a considerable interest as a surgical curiosity I am not aware of any previous record of a foreign body impacted in the ampulla of Vater associated with and evidently causing acute pancreatitis Of more significance, however, are such inferences as may be drawn from this case bearing on the ætiology of acute pancreatitis in general.

Our knowledge of this subject is still inconclusive. Chemical or enzyme action on the pancreatic tissues, due to the interaction of bile and pancreatic juice in the pancreatic ducts, and bacterial infection of the pancreas by one route or another are regarded as the usual causes of the characteristic lesions. The task of allocating the principal rôle to one or other of these factors is complicated by the fact that both of them together destroy pancreatic tissue in those advanced stages of the disease which are alone available for investigation.

Opie (1901) is credited with the first description of acute pancreatitis associated with the impaction of a gall-stone in the ampulla of Vater. He emphasised that the calculus was small, 3 mm in diameter, and said that the pancreatic duct was slightly dilated and stained with bile. He pointed out that a large stone impacted in the same situation would have obstructed the outflow of both pancreatic and common bile-ducts and so would not have caused the mingling of bile and pancreatic juice in the pancreas The mechanical conditions in the ducts in this case could be regarded as being equally favourable to the destruction of the pancreas either by activated pancreatic juice or by organisms derived from an infective cholecystitis In the same paper, however, Opie described experiments which demonstrated that injection of bile into the pancreatic duct of an animal caused necrosis of the organ.

The impaction of a suitably sized gall-stone in the ampulla of Vater is a rare finding in acute pancreatitis Thus, Waring and Griffiths (1923–24), reviewing a series of 39 cases, say that "only in one case, however, have we found definite evidence of obstruction in the ampulla of Vater, or of regurgitation of bile although jaundice has been present in seven cases"

Since, therefore, effective obstruction of the ampulla can be assumed only in a small minority of cases of acute pancreatitis, either an alternative cause of the diversion of the bile into the pancreatic duct must exist, or the view cannot be maintained that bile is an essential cause of the lesion. Such an alternative did in fact suggest itself as a consequence of the description by Oddi (1888) of the sphincter, which now bears his name, controlling the outflow from the ampulla of Vater into the duodenum His experiments were independently confirmed by Archibald and Brow (1919), who concluded that a spasm of this

muscle, which they found capable of withstanding a considerable hydrostatic pressure, would be effective in diverting the flow of bile into the pancreatic ducts and so causing acute necrosis of the pancreatic tissue This theory has not, however, met with general acceptance, and Waring and Griffiths (1923–24) express the more generally held view that the cause of acute pancreatitis is a bacterial infection, probably streptococcal, and that "retrograde infection along the pancreatic ducts by bile is probably a less common cause than lymphatic infection, although its occurrence has been definitely proved"

The chief significance of the case reported here is that the only definite abnormality was obstruction to the outlet of the ampulla of Vater (by an impacted barleycorn), and that in the absence of gall stones and of any signs of inflammation in the gall bladder and bile-ducts it can be reasonably assumed that the presence of bile in the pancreatic ducts was alone the cause of the acute pancreatitis We are therefore provided clinically with a set of circumstances which can usually only be observed by experiments on animals Evidence is thus furnished in support of the view that, when acute pancreatitis develops in the absence of gall stones or of any pre existing disease of the biliary system, bacterial infection from the duodenum or other source need not necessarily be assumed as the causal agent Spasm of the sphincter of Oddi, by inducing a flow of bile into the pancreatic ducts, could of itself create the conditions essential for the onset of acute pancreatitis

The evidence of this case also supports the opinion of Archibald and Brow (1919) that when possible, the surgical treatment of acute pancreatitis should include opening and drainage of the common bile-duct rather than simple drainage of the gall bladder, for this permits of the passage of a probe through the ampulla into the duodenum Their further recommendation that the duodenum should be opened and the sphincter divided is scarcely applicable to most cases, and most surgeons will readily agree with their observation that "in the acute cases, with the patient in a precarious condition, the least degree of interference is probably the best, and that would obviously consist in a cholecystostomy"

I am indebted to Mr J N Deacon, medical superintendent of Rodhull County Hospital, for permission to submit this case for publication.

MEDICAL SOCIETIES

BRITISH MEDICAL ASSOCIATION

SCIENTIFIC MEETINGS, JULY 26–28

SECTIONS OF MEDICINE, SURGERY, OBSTETRICS, PHARMACOLOGY AND PATHOLOGY

At a meeting of these sections under the presidency of Prof DAVID CAMPBELL (Aberdeen) a discussion was held on

Sulphanilamide Chemotherapy

Prof C H BROWNING (Glasgow) said that the place of the sulphanilamide drugs in therapeutics was almost entirely the fruit of laboratory study In experimentally produced streptococcal infections in mice individuality appeared to be a prominent feature of responses to treatment with the sulphanilamide drugs, a relatively small dose might cure one mouse whereas much larger doses might fail in others There was no clear evidence that different members of the sulphanilamide group were more effective for one type of bacterial infection than for another, and the development of drug resistance in a virulent strain of organisms after unsuccessful treatment had not been generally established The drugs were relatively inefficient in the treatment of localised infections of some duration and diseases due to exotoxins, such as diphtheria The properties of these drugs demonstrable in vitro did not explain their therapeutic effect and did not supply data for assessing their curative action A gradual direct action of the drug on the metabolism of the organism in the infected animal, according to the hypothesis of McIntosh and Whitby, could not be excluded but it was more likely that the body, while under the influence of the drug, behaved towards highly virulent organisms much as the normal animal did to non pathogenic types, which were slowly destroyed

Dr G A H BUTTLE (Beckenham) divided the derivatives of sulphanilamide into two groups those with substituents in the amino group, and those with them in the amide group In the first group were Prontosil rubrum, Prontosil soluble, Rubiazol, Proseptasine and Soluseptasine The activity of this group was probably due to their breakdown within the body to sulphanilamide Drugs of this group had no advantage over sulphanilamide in the range of infections which could be dealt with and although some were less toxic they were also less active than sulphanilamide In the second group were Uleron, Albucid and M & B 693 These drugs probably did not break down into sulphanilamide within the body, but were themselves the active agents against the bacteria M & B 693 was effective in infections with pneumococci of all types, whereas sulphanilamide acted only against type III; it was more effective than sulphanilamide in staphylococcal and gonococcal infections and equally effective in streptococcal and meningococcal diseases The superiority of uleron in staphylococcal and gonococcal infections had not been established, this drug tended to produce peripheral neuritis Albucid, which appeared to be completely non toxic, was effective in gonorrhœa especially in females Sulphanilamide was rapidly absorbed and was readily diffusible throughout the body, a part of the drug in the blood and urine was converted into the inactive acetyl derivative A concentration of sulphanilamide in the blood of 10 mg per 100 c cm was required for the treatment of severe infections This could be obtained by a dosage of 1 gramme per day for every 20 lb of body weight Children however, needed 50 per cent more and infants about three times as much per unit body weight Among the toxic symptoms produced by these drugs, agranulocytosis was the only fatal complication, and it occurred usually late in treatment It was very important to do white-cell counts after treatment had been continued for ten days and every third to fourth day thereafter, The most common symptom was cyanosis, but this

should not be regarded as a sign of overdosage. Occasional hæmaturia was due to the deposition of the acetyl derivative in the renal tract. Vomiting and mental depression were more common with M. & B. 693 than with sulphanilamide.

Dr. H. S BANKS (London) said that in a series of 28 cases of meningococcal meningitis given sulphanilamide alone no deaths had occurred, and of 34 cases given M. & B. 693 only one had died Relatively high mortality-rates occurred when serum alone was used, and when serum was administered in conjunction with insufficient doses of sulphanilamide. It was a good plan to change the drug used from M. & B. 693 to sulphanilamide when mental depression became marked, usually after thirty-six hours Four cases had been treated in this way with good results. The concentration of the drug in the cerebrospinal fluid had been found to follow closely the blood level and was approximately half as high.

Dr. F J. T. BOWIE (Aberdeen) described the results of using sulphanilamide drugs in the treatment of gonorrhœa Sulphanilamide gave cures in 70–80 per cent of cases, uleron in 70–90 per cent. and M. & B. 693 in 85–95 per cent. M. & B. 693 appeared to be the drug of choice since it could be given at once, whereas optimal results with sulphanilamide and uleron were obtained only if treatment were postponed for about ten days from the onset of the disease. After treatment with M & B 693 there was a very low incidence of complications (1·5 per cent.) as compared with the high figure (25–30 per cent.) which was the rule before chemotherapy. A total of 20 grammes of M. & B. 693 was sufficient. This could be given in daily 3-gramme doses for six or seven days, or 4 grammes could be given at once, then 2 grammes four hours later, followed by 1 gramme four times a day until the total amount reached 20 grammes. When the latter method was used, nausea lasting from twelve to twenty-four hours was common, but otherwise there appeared to be no danger and the results were better. In a series of seven cases of gonococcal ophthalmia neonatorum treated with M & B 693 all became bacteriologically negative within thirty-six hours; the confinement to hospital was reduced to about seven days as compared with the much longer periods needed for the older methods of treatment.

Dr. W. F. GAISFORD (Birmingham) said that in 627 cases of lobar pneumonia occurring between March, 1938, and June, 1939, a mortality-rate of only 5 4 per cent had been achieved as a result of treatment with sulphanilamides A striking decrease in mortality had occurred in elderly patients. The results in bronchopneumonia were not so good and this was probably due to the mixed type of infection. In the 627 cases of lobar pneumonia, a clear pleural effusion which did not proceed to pus formation was found in 10. The incidence of empyema was 4·5 per cent and the combined figures for clear effusion and empyemata were approximately the same as the incidence of empyema in 1937, before chemotherapy. This suggested that the clear effusions represented empyemata aborted as a result of chemotherapy.

Dr MEAVE KENNY (London) said that the death-rate from streptococcal puerperal infections had been reduced from about 28 per cent. to about 5 per cent. by sulphanilamides. An early series of cases had received an average of 18 grammes of prontosil rubrum and the mortality-rate in this series (5·3 per cent.) had not been improved upon by much larger doses of sulphanilamide in subsequent series. There was now a tendency to give too large doses and a return to moderate doses of prontosil rubrum would produce less toxic effects. In the sulphanilamide treatment of *B. coli* pyelitis of pregnancy the smallest possible dose should be used, in view of the labile character of the hæmopoietic system at this time Usually 1·5 to 2 grammes in twenty-four hours was sufficient and more than 3 grammes had never been necessary. The proper prophylaxis of puerperal infections by strict attention to asepsis should not be relaxed. The sulphanilamide drugs should be used as a prophylactic measure only when there was reason to suspect the presence of pathogenic streptococci in the atmosphere, and in such cases the drug should be given in full curative doses

Dr. W. R. SNODGRASS (Glasgow) said that although there was general agreement regarding the efficacy of sulphanilamide therapy in tonsillitis there was actually a scarcity of properly controlled studies In his experience acute widespread and invasive infections responded best, and the poorest results were found in single walled-off lesions such as quinsy In scarlet fever sulphanilamide therapy had no significant effect on the initial symptoms or signs, or on the incidence or duration of complications. In a carefully controlled study of the treatment of erysipelas by sulphanilamide he had found that the drug was of great value and suggested that a suitable dosage in adults was 1½ grammes of prontosil rubrum or 1 gramme of sulphanilamide every four hours until the lesion had ceased to spread and the primary pyrexia and toxæmia had ceased; thereafter 1 gramme thrice daily should be given for fourteen days to prevent relapse.

Dr. P. H. MANSON-BAHR (London) pointed out the striking fact that sulphanilamide had no effect on malaria in man although it acted like a charm in *Plasmodium knowlesi* malaria in monkeys The results in undulant fever in man had been on the whole favourable, but not dramatic, and good results had also been obtained in the treatment of actinomycosis

Dr. THOMAS ANDERSON (Glasgow) considered that before the results of treatment of different series of cases of lobar pneumonia could be fairly compared it was essential to know the types of pneumococcus producing the lesion. In Glasgow the incidence of type II pneumonia was very high and therefore the mortality-rate would not be so low as in districts where type I infections predominated. He stated that 0 4 gramme of rubiazol was equivalent to 1 gramme of sulphanilamide in the treatment of erysipelas and accordingly the action of rubiazol could not be entirely due to its breakdown into sulphanilamide within the body.

Dr. E N. MACDERMOTT (Galway) said that he had gained the impression that in lobar pneumonia treated with sulphanilamide resolution of the consolidated area was slower, and in empyema the pus was thin in consistence. These changes might be due to the leucopenia which so often accompanied administration of the sulphanilamides.

Professor CAMPBELL considered that a concentration of sulphanilamide in the blood of 4 mg. per 100 c cm was probably as effective as a concentration of 10 mg Rectal administration of the drug suspended in saline and alkalinised to bring it into solution should be used as an alternative to parenteral injection where severe vomiting rendered oral administration impossible. Because of the immense amount of human suffering which had already been prevented by the use of the sulphanilamide drugs the sanity of any individual who still wanted a justification for experimental work in animals must be questioned

SECTION OF MEDICAL SOCIOLOGY

At a meeting of this section with SIR JOHN ORR, F R S, the president, in the chair, a discussion on

Food Conservation in Relation to the National Food-supply

was opened by SIR JOSEPH BARCROFT, F R S (Cambridge) He began by disclaiming any intention to deal with Government policy, how much the Government saw fit to store of this and that was not his affair All he proposed to do was to say something about what science has done to increase the selection of food at their disposal From this standpoint foodstuffs fall into three classes —

(1) Those that can be kept indefinitely—in practice, say ten years

(2) Those that can be kept for a season—say ten months

(3) Those that can be kept on any ordinary voyage —say two months or less

In the first group is wheat, its storage against emergencies is as old as the book of Genesis, where it is seen that Joseph had his seven year plan Not all wheat keeps indefinitely, and the critical characteristic appears to be the water content In the best wheats the water content is low and the wheat will keep Home grown wheat has not a high keeping property, but at the moment this does not matter much because the demand for grain so far outruns the home supply that home wheat can be eaten at once Weevils also constitute a major problem in wheat storage over long periods, but not perhaps an insoluble one While wheat is very bulky, flour can be stored in a smaller space, its water content can be reduced to about 11 per cent, and it will then keep a very long time in tins, where it is inaccessible to both water and weevils Whale oil and vegetable oils can be kept for three or four years if air is excluded Canned meat of various sorts, if properly packed is entirely suitable for food for a very long time When discussing any possible loss of vitamin value, comparison should always be made with cooked fresh meat, not raw meat

Of foods that can be stored over a season milk is the most important, said Sir Joseph, for it contains all essential nutritive elements and food factors in an easily digestible form It is possible that the best dried milk may even be held at refrigeration temperature for ten years, with some alteration of flavour but not of nutritive value Next in importance to milk are potatoes These are ordinarily kept only for a season, but they will last much longer if dried until the water content is only about 8 per cent There are on the market preparations—notably in the form of powder—which are quite satisfactory as regards keeping quality and palatability Eggs are preserved best over a season in cold storage in an atmosphere containing 2–2½ per cent CO_2 and with the air highly but not completely saturated with aqueous vapour In conclusion the speaker said he thought that much work could be saved, prices stabilised and speculation discouraged by a policy of storage of foodstuffs which could be released in the correct quantities at the appropriate moments

MR G A REAY, D Sc (Aberdeen) speaking on the preservation of fish, pointed out that, unlike meat or game it does not improve on hanging Marine bacteria are main agents of spoilage Even under the best conditions of handling and stowage, gutted white fish will not keep fresh in crushed ice for more than 10–12 days and for herring stowed without gutting, according to custom the limit is 4–6 days Smoked fish, such as "finnans" and kippers, keep satisfactorily no longer than a week at ordinary temperatures, and no longer than a fortnight at 0° C (32° F) The bulk of our national supply of fish is normally stored only for such short periods Both white and fatty fish can be held, however, in excellent condition for a season—i e, for anything from two months to a year—by proper freezing and cold storage Thus herrings, if rapidly frozen, well glazed, and stored at −30° C (−22° F) remain in first-class condition for six months, after which the fat gradually becomes rancid White fish similarly treated remain in excellent condition for a year or more, and certain species, such as lemon sole, have been found highly palatable after four years Kippers have been successfully stored at −30° C (−22° F) for four months and smoked white fish for six Fish can also be successfully preserved for a season by canning Both wet and dry salted fish keep in good condition with certainty for a season if a chill temperature is used, say, 0° C (32° F) to −3° C (26 6° F) On the question whether fish can be kept in any way for long periods, such as ten years, Dr Reay said that few reliable data are available It is possible that white fish, though not fatty fish, would store well for a good part of this time at −30° C (−22° F) Certain oily packs of canned fish are said to have been successfully preserved for ten years Hard dried salted fish would probably keep at 0° C (32° F) in good condition, for several years if suitably packed in airtight containers Freezing and cold storage, properly applied, is preferable to all other methods of preserving fish, since it has least effect on the flesh

MR FRANKLIN KIDD, D Sc (Cambridge) discussed fruit and vegetables For long distance transport and for season-to-season storage refrigeration is used, together with control of the oxygen and carbon-dioxide composition of the atmosphere of the store For longer storage three methods are available—freezing, drying and canning It is known on what principles long period storage should be based, but there has been little practical experience over this period It is rather the deterioration of the can than of the contents that sets a limit to the storage possible, for the metal is corroded by the contents By the application of lacquer, tin and iron can be very thoroughly, but not yet completely, protected against the contents of the can By this means blackcurrants, cherries and damsons have been kept for six years, raspberries, loganberries, blackberries and strawberries for four years, beetroot and carrots seven years and peas ten years If canned goods are held at a low temperature their storage life increases considerably Freezing and holding at a very low temperature is an obvious method for preserving fruit and vegetables The freezing should be carried out very sharply so that more of the juice is retained on thawing The products are superior as regards palatability and appearance to those preserved by canning A pre-freezing heat treatment of short duration prevents disagreeable flavours and discoloration in certain vegetables and fruits where these tend to occur with freezing Freezing requires expensive machinery and constant attention where is the storage of canned products needs no special equipment

Dried products are in three categories seeds and seed products, products like raisins which bear little resemblance to the fresh fruit, and apples, pears and vegetables which simulate the fresh article when reconstituted with water It is important to reduce the water content to a low level and exclude oxygen A new method of low temperature drying produces dried products which retain their natural shape and colour and also completely the natural flavour

Summing up, Mr. KIDD said that only certain fruits and root crops, but no green vegetables, can be stored for twelve months in a fresh condition By canning, freezing or drying all kinds of fruits and vegetables can by present procedure be stored easily up to two years with complete retention of their nutritive value and by taking the necessary precautions they could certainly be stored for much longer

Mr. W. GODDEN (Aberdeen) remarked that almost every type of perishable food is canned in Great Britain, and it is therefore important to have reliable information on the nutritive value of canned foods. Work on these lines has been done in America and France but little with reference to foods canned in this country. At the Rowett Research Institute, Aberdeen, a long-period feeding trial with rats was undertaken.

One group of rats was fed entirely on canned foods such as beef brisket, tongue, herrings, Brussels sprouts, cabbage, spinach, beetroot, carrots, turnips, potatoes, dwarf beans, green peas, haricot beans, apples, cherries, plums, tomatoes, dried milk and syrup. Similar foods when in season were purchased or grown locally and used for the second group; at other times vegetables of a like nature were substituted for those not in season, and the same applied to fruit and fish. If anything the experiment was unduly weighted against the canned food in that most of the vegetables were grown at the institute and gathered on the day they were required for feeding Each group originally consisted of 10 does and 5 males. When they reached maturity they were allowed to breed.

The experiment lasted eighteen months, during which time 1700 rats were used in four successive generations, approximately half of which received nothing but canned foods from weaning onwards No significant difference was found in the size of the litters, average weight at birth and at weaning, mortality at birth or from birth to weaning, or in growth-rate of each successive generation from weaning to 119 days The rat is not susceptible to a deficiency in vitamin C, so it could not be shown whether any destruction of this factor had occurred in canning and storage. Experiments by Miss Olliver at Cambridge, however, have shown that the destruction of vitamin C when fruit and vegetables are canned is small and likely to be much less than that caused by shop storage of fresh foods and their subsequent household cooking Canned foods, in Mr. Godden's opinion, may be used with perfect confidence from the nutritional point of view.

Prof H D KAY (Reading) said that given enough calories, roughage, and iron (and perhaps copper) in the diet, a pint of milk per day in addition will ensure effective nutrition in almost any human being. Therefore the conservation and storage of milk with a minimum of damage is one of the most serious items of food-defence policy The storage of a food material containing over 87 per cent. of water is not economically sound One of the desiderata of milk conservation is to obtain a product which is readily convertible into a liquid milk resembling the original liquid milk. There are at present two main methods of conservation of whole milk: (1) condensing it by evaporation to about a third of its volume, with or without the addition of cane-sugar, followed by sterilising in sealed tins; and (2) drying completely, or almost completely, and storing in suitable containers. Unsweetened evaporated milk and condensed full-cream sweetened milk, when properly prepared and and kept cool, will remain almost unchanged for years.

Dried milk in some respects—e g, its relatively greater food value per unit of storage space—is a preferable article as regards conservation, but until very recently its keeping powers were inferior. The development of a tallowy flavour in dried milk may be considerably delayed by storing it in air-proof tins and evacuating the tins and filling with nitrogen or other inert gas Such dried milks will keep for eighteen months at least at ordinary temperatures and probably much longer at 0° C. Dried milk manufactured in this country is usually made from spring and summer milk, at its most nutritious stage, and when made up with water to the original volume may actually be more nutritious than some fresh winter milks In war-time the compulsory addition of fairly large quantities (say up to 10 per cent) of dried milk to the flour mixture used in bread-making might prevent serious nutritional deficiencies

SECTION OF PHYSIOLOGY

AT the meeting of this section on July 27, with Prof E. D ADRIAN (Cambridge) in the chair, a discussion on the

Pathology of Chloride Metabolism

in man was opened by Dr. ALEXANDER LYALL (Aberdeen). He said that during the preceding decade much importance had been attached to the disturbances of chloride metabolism in man with reference to a group of diseases, including intestinal obstruction, pyloric stenosis, chronic nephritis, œdema, obesity, hypertension and Addison's disease The principles which controlled the chloride balance of the body and determined the absorption, secretion, reabsorption and excretion of chloride were of significance in these diseases He outlined the normal cycle of chloride metabolism in the healthy adult and showed from experimental data that the average daily intake of chloride was about 12 grammes, that the basal requirement was about 2 g in the absence of abnormal perspiration, and that there was a continuous process of secretion and reabsorption to and from the intestinal lumen The daily tidal exchange of chloride in this way amounted to about 50–60 g, equal to half the total available chloride in the blood-plasma and tissue fluids The gastric secretion of chloride could amount to 30 g. in 24 hours, as shown by continuous gastric aspiration, and the biliary secretion contained up to 9 3 g of chloride daily in a patient with a biliary fistula. In intense sweating the skin loss in chloride could reach 12 g. daily and such losses were met with in acute febrile disturbances, in the sweats of tuberculosis and acute rheumatism, in pneumonia and thyrotoxic crises, and during heavy muscular exertion in hot surroundings. The main controlling influences concerned in the maintenance of the chloride-content of the blood-plasma and body fluids were the kidney itself and an adequate intake of chloride The former played the major part since excretion of chloride in the urine ceased as soon as the plasma-chloride showed any tendency to diminish Comparison of the chloride-content of the blood and urine in patients with hypochlorræmia following intestinal obstruction and in patients with experimental hypochlorræmia made it clear that renal secretion of chloride ceased when the plasma-chloride level fell to 520 mg. per 100 c cm. This figure was almost constant in health, but might be raised in certain types of renal disease with œdema, or lowered in some cases of intestinal obstruction with secondary toxic nephritis

Dr. Lyall then described the clinical manifestations of hypochlorræmia, which included anorexia and nausea, mental apathy, muscular cramp, and even

disorientation and convulsions The condition was complicated by dehydration and alkalosis in higher types of intestinal obstruction and often by acidosis in lower intestinal obstruction In treatment the administration of adequate amounts of fluids and salt was necessary and if this could not be efficiently attained by the intravenous route recourse might be had to jejunostomy with success Dr. Lyall pointed out the importance of the continuous secretion of chloride by the stomach in pyloric stenosis It was shown from experiments on patients with pathological hypochloræmia that the gastric mucosa was still able to elaborate a secretion containing normal amounts of sodium chloride In experimental hypochloræmia in man the gastric content was found still to contain 640 mg per 100 c cm of sodium chloride when the plasma chloride value had fallen to 365 mg per 100 c cm The total volume of gastric juice was reduced by 50 per cent It was clear that the secretion of free HCl and chloride by the gastric mucosa was, to a large extent, independent of gross changes in the chloride content and alkaline reserve of the blood plasma

In Addison's disease Dr Lyall had noted in 1937 that the chloride excretion in the urine was high in relation to the chloride level of the blood-plasma He and I A Anderson had then stated from observations on two patients with Addison's disease that where the urine contained over 200 mg chloride per 100 c cm, while the plasma chloride level was below the minimum normal level of about 530 mg per 100 c cm, the diagnosis of Addison's disease was strongly suggested Cutler, Power and Wilder had tested the validity of this suggestion by preliminary observations on nine subjects with adrenal insufficiency and on eight subjects without evidence of disease of the adrenal glands In recent investigations on patients presenting clinical features suggestive of Addison's disease, he and Anderson had established that a ratio of less than 2 to 1 between the plasma and urine chloride after a test period of chloride free diet was diagnostic of Addison's disease

PREVENTION AND TREATMENT

Mr D L C Bingham (Edinburgh) was unfortunately unable to read his paper on hypochloræmia In his résumé he referred to the work of Dick, Maddock and Coller, who suggested that salt deficiency should not develop if losses from the gastro intestinal tract were replaced with equal volumes of physiological saline With Bartlett and Pedersen, Mr Bingham had found this replacement method effective in prevention Many patients however came under observation when a substantial but unknown loss of sodium chloride had already occurred Various workers, including Haden and Orr, and Falconer and Lyall, had attempted to make a basis for quantitative administration of chlorides The latter had found that it required approximately 15–30 g of salt to raise the plasma chloride by 100 mg per 100 c cm

Mr Bingham had based the rationale for chloride replacement on the assumption that the percentage reduction in the chloride concentration of extracellular fluids was equal to the percentage decrease in the total chloride-content of the fluid and that the plasma chloride concentration was a satisfactory index of the chloride-content of extracellular fluids Assuming the normal chloride content of the body to be 0·248 per cent of the body weight, the formula could be reached that chloride lost was equal to

$$\frac{560 - X}{560} \times 0{\cdot}248 \times \text{weight in kilogrammes},$$

where X was plasma chloride value. Simplification of this formula produced the finding that 0·2 g sodium chloride per pound of body-weight was required for each reduction of 100 mg per 100 c cm in the plasma chloride value

Mr Murray A Falconer (Oxford) said that surgeons everywhere were now aware of the necessity for correcting disturbances of chloride metabolism by the administration of infusions of saline in those conditions where hypochloræmia might arise He pointed out that although chloride was the principal ion which was lost in the gastro intestinal secretions, other ions, particularly the bases sodium and potassium, were also lost from the circulating fluids In collaboration with Osterberg and Bargen he had recently investigated the alterations which took place in the concentrations of the individual bases of the blood in patients suffering from intestinal obstruction They did not find that changes in the chemical composition of the blood constantly accompanied intestinal obstruction but that when changes did occur there was a tendency for the concentration of sodium, potassium and calcium to decrease with most marked alteration in the serum potassium These observations on the serum-potassium level in obstruction of the bowel in man were not in accord with the findings of Scudder, Zwemer and Truszkowski, who noted an increased concentration of the blood potassium in cats with experimental obstruction The difference was possibly associated with the higher concentration of intracellular potassium in man

In their clinical investigations Mr Falconer and his co workers noted a general parallelism between the condition of the patient and the degree of disturbance of the chemistry of the blood When the clinical condition of the patient was deteriorating the values of the serum sodium and the serum bases showed a tendency to fall, but when clinical improvement was taking place the blood constituents tended to resume their normal levels They were unable to correlate any definite symptom or symptoms with the low levels of sodium, potassium or calcium in the serum, but they felt that these alterations contributed towards the degree of severity of the intoxication In three patients carefully investigated the addition of potassium and calcium salts to parenteral saline brought about improvement not achieved by saline alone Mr Falconer was of the opinion that solutions, such as Ringer's solution and others containing potassium and calcium in addition to sodium salts, should be used in the treatment of patients showing hypochloræmia

SECTIONS OF DISEASES OF CHILDREN AND MEDICAL SOCIOLOGY

Prof G B Fleming (London) presided at a joint meeting of these sections for a discussion on

Nutrition of the Mother and Child

Sir John Orr (Aberdeen) said that till a few years ago the physiology of nutrition had dealt almost exclusively with caloric and protein needs Stress had been laid on man values which were absolute and little attention had been paid to the quality of food Man-values were useless, however, for the growing child or pregnant mother, they needed everything for the growing man plus material for growth The faster the rate of growth the greater the call for extra food, and in late pregnancy the mothers' needs were greater than in the early months Many mothers of the poorer classes had reached a stage of malnutrition where they had no reserves for their growing children Recent studies had shown that, with a calcium deficient diet, pregnant women

showed a variety of symptoms, and that their children, when not stillborn, were often poorly developed. Another common deficiency in the diet was vitamin A and it might reveal itself by a prolonged gestation period and a high infant-mortality. Knowledge of the nutrition of the mother and child in early years was still grossly inadequate Dietetic deficiencies were almost always multiple. The problem was what are the dietary requirements of the pregnant woman. It had been shown that the pregnant woman required more protein and iron and three times as much calcium as the adult man. An important advance towards better national health had been made by the League of Nations Committee which concentrated its attention on the health of mother and child. It was unfortunate that the kind of diet recommended, which included a litre of milk, an egg and fresh fruit daily, was beyond the purchasing power of many working-class families As the diets got worse there was always a rise in infant-mortality and morbidity-rates. What would happen if they could give an adequate diet such as that recommended by the League committee? An improvement of physique would certainly result Even with old people, they had shown in Aberdeen that great improvement in the calcification of bones could be got by giving a diet adequate in calcium After only six weeks' adequate diet, nearly two-thirds of the weedy army recruits rejected on medical grounds were almost fit for service. The results obtained in school-children in Scotland had been even better. Increased muscular strength and mental ability followed the giving of supplementary diets. The time was ripe for a large-scale test on expectant mothers The result of giving adequate food to two or three thousand women in a district where infant-mortality was high would show how much maternal and infant-mortality rates could be reduced. Diseases of children could, in all probability, be lessened and the physique of the next generation improved by the application of the results of such an investigation.

Prof J C. DRUMMOND (London) said that Sir John Orr's problem might be partly answered by investigations going on in London where 5000 mothers had been given supplementary calcium and iron daily during pregnancy, and controlled observations were being made of mortality and morbidity. Estimates of the amounts of vitamins required for health had been going steadily up, a good natural diet might not contain anything like the estimated optimum of vitamin D, for example. It was possible that if the calcium and phosphorus requirements of the body were fully met, the amount of vitamin D necessary might be minimal There was not much seasonal variation in the vitamin D of human milk; women on poor diets might however yield milk with a poor content Even when getting halibut oil some of his patients had not shown much improvement and the optimum might be 6–7 units per 100 c.cm of milk. Women with a calcium intake of as low as 0 27 g. might still give milk with a normal calcium content. Was the extensive analysis of human milk possibly a reflection on the inferior types of diet common for the last 60 years? There was a tendency to exaggerate the importance of certain vitamins which could be had solely from natural food.

Prof. NOAH MORRIS (Glasgow) stressed the mineral aspect of nutrition Calcium was important in the control of neuromuscular excitability, the acid-base equilibrium and cellular permeability as well as skeletal growth. A good calcium diet for the mother might improve breast milk and recent work in Norway had emphasised this point The total mineral requirement in the last two months of pregnancy was 1 45 g. per day The expectant mother should therefore get a quart of milk a day in addition to the ordinary diet. While growth depended on the calcium intake, the deposition of lime involved other factors. The only condition in which he had found much delay in calcification of the bones was cretinism. In Glasgow, where 489 children had been examined for rickets, only 16 had been diagnosed in the first instance, but with careful examination over 49 per cent. had two or more signs of the disease. He had often seen the disease in the first three months of life and it was important to take antirachitic measures in children from rickety areas. The boiling of milk had no effect on its calcium, phosphorus and nitrogen content. Vitamin D should be given, the convulsions so often seen in children were due to a deficiency of the vitamin and later on to a poor intake of calcium Preventable osteoporosis had, he believed, a much higher incidence than was commonly known

Dr. H. E. MAGEE (London) said that of 100 pregnant women examined in Blackburn 39 had a low serum calcium, but there was no relationship between symptomatology and the mineral deficiency Those women who had symptoms such as headache and vomiting had also high blood-phosphatase values, and these high values were statistically significant. In the West Riding of Yorkshire they had already examined over 200 pregnant women and they hoped to be able to get some interesting information.

Dr. J. C. SPENCE (Newcastle-on-Tyne) said that there had been an obvious improvement in health in the last 20 years Xerophthalmia was common in industrial areas in 1926; he thought it would not be likely to reappear again even under similar unfavourable conditions. But the economic situation still made one pause to think. All cases of rickets should be notified and fully investigated. Unfortunately with an increased income there was often no corresponding increase in the quantity or quality of the diet Ignorance and incompetence were other problems Incompetence was rare and ignorance should be treated by propaganda. There had been he held an unfortunate deterioration in housecraft. He doubted if there was much to be alarmed about in the drain of calcium from the lactating woman Even among the well-to-do exposure to infection was the serious risk

Dr GRACE CUTHBERT (New South Wales) thought that the services in Scotland were too much concentrated on the poor mother who often had not the vitality to follow the advice given. In her own country a school of mothercraft directed by leading pædiatricians had done much good

Professor DRUMMOND mentioned similar schools in London where simple talks on dietetics were given and where simple meals were cooked.

Dr. ELINOR SIMPSON (St Andrews) said that propaganda was needed for breast-feeding. In every system there were indications of better health on breast-feeding

Dr W. G. WICKREMESINGHE (Ceylon) mentioned that calcium deficiency was very common among his people and complementary feeding to breast-feeding was often necessary.

Dr. W. G BOOTH (Boston) stressed the willingness of public-health officers to assist in solving dietetic problems; unless notification of rickets was to provide a lever for useful work it would not be of much help.

Dr D. E MASON (London) emphasised the need for extra diet in the early months of pregnancy.

Dr GRIFFITHS EVANS (Carnaervon) recalled the qualities of a good housewife—a quick eye, good sense of smell and curiosity The housecraft common in rural areas was not likely to be taught in welfare-centres

Dr H V P CONNICK (New South Wales) thought that every schoolgirl should receive compulsory teaching on food-values and cooking

Dr ALAN MONCRIEFF (London) spoke of the wide-spread ignorance of the medical profession on dietetics and thought that education of the doctor should come first Scientific experts must tell us simply the elements of a good diet There was need of propaganda for breast-feeding and control of the many misleading advertisements in the press was necessary

Dr M F J LOWENFELD (London) said that investigation was needed into the use of vegetarian diets

Dr ISABELLA LEITCH (Aberdeen) thought it important to remember that when cow's milk was diluted its calcium and vitamin content was diminished

Sir JOHN ORR, in reply, agreed with Professor Drummond that as calcium and phosphorus are adjusted the need for vitamin D gets less But the ebb and flow of minerals is not the same in properly fed people as in the undernourished Malnutrition in the population might be obscured as in the nineteenth century, where national physique had reached its lowest point, but the fact had been masked by advances in the control of disease

REVIEWS AND NOTICES OF BOOKS

The Study of Society

Methods and Problems Edited by F C BARTLETT, M GINSBERG, E J LINDGREN, and R H THOULESS London: Kegan Paul, Trench, Trübner and Co 1939 Pp 408 10*s* 6*d*

THIS book provides an excellent survey of the scientific methods available for research in social psychology Perhaps the most interesting thing about it is its method of production Four years ago the 17 contributors to its pages formed them selves into a discussion group, meeting at regular intervals Each member drafted his chapter, which was sent to all the other members and then criticised at a subsequent meeting As the writers themselves point out, the book provides a "practical rebuttal of the charge that when different psychologists, anthropologists, or sociologists deal with the same problem little but disagreement emerges" Some of the agreement, no doubt, is due to the *fact* that most of the writers were trained in the same university (Cambridge), and so represent the same school of thought The method, however, has been eminently successful, and it might profitably be adopted in other spheres

The underlying notion animating each contributor is that "the future of human civilisation depends upon man's capacity to understand the forces and factors controlling his own behaviour" Some of the chapters will be of special interest to medical men—for example, Mr J T MacCurdy's discussion of the relation of psychopathology to sociology, Miss Mary Collins's account of modern trends in child psychology, Dr C J C Earl's description of methods of assessing temperament and personality, and Miss Clement Brown's review of the methods of investigation that may be used by mental health workers Each chapter has a long but carefully selected set of references for further reading The authors repeatedly bring out the value of observa tions contributed by field workers who have direct access to information but no special training in sociology Among these the medical man finds a place, *for he obtains* incidental glimpses of social problems with an intimacy and from an angle to which no other observer can lay claim

Klinik der Lungenasbestose

By Dr HANS WILFRID WITDLER, assistant in the Medizinische Universitäts Klinik, Berlin Charité Leipzig Georg Thieme, 1939 Pp 152 RM 9 50

THIS monograph is one of a series on work and health published under the authority of the Reichs arbeitsministerium It consists primarily of a clinical, statistical and radiological record of the examination of 310 workers in two asbestos factories The workers were all ambulant cases and were examined at the clinic

The book contains introductory sections on the history, mineralogy and pathology of the subject, but these are very *brief* and even the *familiar* picture of the asbestosis body is omitted The 310 cases are classified according to the usual three stage radio-logical classification used for silicosis The results of the examination are as follows stage nought —i e, pre-stage one—240 persons, stage one, 46, stage two, 15, stage three, 9 The investigations made on the cases were intensive and included not only the usual clinical and radiological observations but examination of eyes, nose and throat, electro cardiograph records, &c Only 5 cases are recorded of asbestosis accompanied by tuberculosis and none of asbestosis and pulmonary carcinoma Only 5 deaths are recorded with 3 autopsies The length and type of exposure, together with the sex and age of the workers are given in a series of statistical tables, the whole supported with good X ray pictures There is a useful bibliography which contains a record of most of the now historic early work

The monograph is a valuable contribution to the subject, especially on the clinical side and praise is due for special investigations, such as blood-counts, sedimentation rates, examination of eyes, upper respiratory tract, and electrocardiographical records which have not been recorded, as far as we know, in most of the other series of asbestosis cases published

Bacteria in Relation to the Milk Supply

(2nd ed) By C H CHALMERS, B Sc Edin., N D A, formerly of the University, Leeds London: Edward Arnold and Co 1940 Pp 209 6*s*

WHILE there are many books on medical bacterio logy, there is room for reliable accounts of bacteria in relation to special subjects This applies particu-larly to milk, since bacteriology is important in its hygienic control, is used as an official check on the special designated milks and, in particular, is of great value in the *commercial control of milk* and dairy products generally Mr Chalmers's little book is a useful and valuable guide, mainly on the commercial side of milk control Part I describes the various routine methods of examining milk, the bacterio-logical examination of water taints and abnormal conditions in milk the bacteria which may be found in milk, and the control of the dairy plant Part II is concerned with general bacteriological technique and includes appendices on culture media stains, &c.

The section on water examination covers only nine pages; this is inadequate and should either be expanded or omitted altogether. The same applies to the brief and inadequate account of pathogenic organisms in milk and this might with advantage be omitted. The information as to the non-pathogenic organisms, such as the various lactic acid bacilli, is clear and reliable and might have been amplified, as reliable descriptions of these non-pathogenic organisms are not very readily available. These are minor questions of apportionment and the book as a whole can be recommended to all those interested in the bacteriology of milk; it should be particularly helpful to those commercially concerned in its regulation.

Modern Treatment in General Practice Year-book 1939

Edited by CECIL P. G. WAKELEY, D.Sc. Lond., F.R.C.S, F.R.S.E., senior surgeon, King's College Hospital, London. London: Medical Press and Circular. 1939. Pp. 365. 10*s.* 6*d.*

THIS book, intended for the general practitioner, divides itself into four parts. The first and largest portion deals with common conditions such as flat-feet, otitis media, "heart attacks," measles, and pyelitis in women and children; this section is of great value as recent views are clearly outlined. The second part, concerned with rare conditions such as acoustic-nerve tumours, blackwater fever, muscular dystrophies and cancer of the cæcum, will probably seldom be consulted. The third part considers conditions in which the treatment is unlikely to be in the hands of the family doctor—spina bifida, papilloma of the bladder, strabismus and slipped femoral epiphysis for example; nevertheless this section will help in the selection of suitable cases. The fourth part deals with the pitfalls in diagnosis. This year it concentrates on swellings—of the thyroid, breast, axilla, groin, neck and lower jaw. There are also six articles on the diagnosis of chest conditions.

The book is good value for half a guinea The contributors have dealt with their subjects in a practical and helpful way, and even the most eminent have avoided serving up old wine in new bottles. Its new title makes the book an annual; its successors will be welcome.

Evolution of Genetic Systems

By C. D. DARLINGTON, D.Sc.Lond., head of cytology department, John Innes Horticultural Institution London. Cambridge University Press. 1939. Pp. 149. 10*s.* 6*d.*

THE question which this book seeks to answer is how far the variation in genetic systems observable today throughout the world of animals and plants can enable us to reconstruct the steps in their past evolution. The "naked gene," which is supposed to exist in the ultramicroscopic virus, is held to be the prototype of the self-propagating chemical units of which are built the chromosomes and plastids of higher organisms. Asexual reproduction is made possible by mitosis of the chromosomes; fertilisation, meiosis and crossing over pave the way for haploid forms; the postponement of meiosis leads to diploid sexual forms; and from these can be visualised the development of polyploid, sub-sexual and sexually differentiated organisms. But reversions to asexuality are possible from all these stages.

Fundamental evolutionary problems are raised in the discussion of these transitions. The origin of meiosis and sexual reproduction, in particular, challenges the imagination; in Dr. Darlington's view, it presents the most violent discontinuity in all evolution. "It demands," he says, "not merely a sudden change, but a revolution It is impossible to imagine it as the result of a gradual accumulation of changes each one of which had a value as an adaptation either Lamarckian or Darwinian"

The book is a contribution to the philosophy of evolution. It presupposes an already extensive familiarity with the now elaborate terminology of chromosome structure and function. The author shows little gift for clear exposition, and his book, which is in no sense a textbook for the uninformed but interested public, makes difficult reading.

Photography by Infrared

By WALTER CLARK, Ph.D., F.I.C., F.R.P.S., Kodak Research Laboratories. London. Chapman and Hall. 1939. Pp. 397. 25*s.*

ALTHOUGH the possibility of photography by infra-red radiations has been known for half a century and Prof R W. Wood made excellent landscape photographs in this country by infra-red light nearly thirty years ago, it is only within the last decade that improvement in materials has made the process one of general application and popular interest This exceedingly useful book is the first comprehensive account in any language of the principles and practice of infra-red photography. Medical interest is catered for by chapters on medical infra-red photography and infra-red photomicrography. The process is of use in the study of the superficial veins (transparency of the skin to infra-red is appreciably increased by a superficial layer of oil or glycerine), photography of pathological specimens, examination of the iris in cases of corneal opacity, the measurement of the dark-adapted pupil, estimation of healing of lupus under its scab, transillumination, examination of the blood in CO poisoning, and the study of embryological and histological sections In dealing with infra-red photomicrography, such important practical questions as focusing and the choice of objectives and filters are adequately considered.

Other noteworthy chapters provide a useful description of the sensitising dyes that have made infra-red photography possible, and an exhaustive account, well illustrated and fully documented, of the numerous applications of the process in the arts, in science, and in industry. Two sections on photographic darkroom practice and characteristics of photographic materials will be useful to anyone interested in practical photography of any sort. Throughout the book the principles involved are always clearly discussed, but the emphasis is essentially practical—witness the full bibliography at the end of each chapter; the descriptions of all available materials—plates, films, lenses, filters; and the careful statement of the limitations of the process in particular instances The author explodes the popular impression that infra-red photography can increase visibility through fog dense enough to be a menace to navigation.

Altogether, this is a model work of its kind. Anyone who practises infra-red photography will find just the information he wants to perfect his technique; and anyone who wishes to try the process will obtain a fair estimate of its possibilities and also the practical knowledge to enable him to avoid the pitfalls that attend an untutored excursion beyond the visible spectrum.

THE LANCET

LONDON SATURDAY, AUGUST 12, 1939

THE INSANE SPOUSE

In two divorce cases decided at the end of July the respondent husband was certified as insane In neither case was the wife able to ask for a decree on the ground of incurable insanity, inasmuch as the husband had not been continuously detained under care and treatment for the full statutory period of five years In one case the ground was desertion, in the other it was cruelty The court had to consider whether insanity, by depriving the husband of the power to form an intention, gave him immunity against the charge of a matrimonial offence

In one of the cases (Williams v Williams) Mr Justice Langton held last March that a husband detained in a mental hospital could not be guilty of desertion In 1933 the Wallasey magistrates had granted Mrs Williams a maintenance order on the ground that her husband had deserted her and had wilfully neglected to provide for her reasonable maintenance In the following year Mr Williams was certified to be insane, he has been detained under restraint ever since Mrs Williams alleged that she had been deserted from 1933 onwards She was entitled to a divorce if she could establish three years' continuous desertion immediately preceding the date of her petition (Jan 21, 1938) Mr Justice Langton ruled that desertion, to constitute a matrimonial offence, must be a wilful and voluntary act, and that the husband was incapable (from June, 1934, onwards) of forming the necessary intention to desert his wife The Court of Appeal agrees, though not without hesitation and regret The de-facto severance of the marital relationship continues in the absence of some step directed to its restoration In the ordinary case the continuing existence of the intention to desert would be inferred, it could not be disproved without some definite step of the deserting spouse The intention to desert is presumed to continue unless the respondent proves 'genuine repentance and sincere and reasonable attempts to get his wife back." A person of unsound mind could not have the capacity to intend any such step, there could not be the quality of volition required to produce a legal result The Master of the Rolls confessed that, during the arguments, he had at one time thought it might be possible on the facts of a particular case to draw an inference what the conduct of the lunatic would have been if he or she had remained of sound mind But the Court of Appeal was satisfied that this was not a permissible solution The court could not assume what was impossible in law—namely, that the lunatic was capable of forming an intent, the court could not say that, if the lunatic had been capable, he would have acted in a particular way The Master of the Rolls added that the court's decision would in many cases involve grievous hardship Lunacy supervening the day before the presentation of the petition would deprive the deserted spouse of the chance of release This would be a capricious operation of the law as it stood, but it was a matter which could not be put right save by legislation Leave was granted to appeal to the House of Lords

In the second case (Astle v Astle) the wife alleged cruelty The parties were married in 1927 Three weeks later the husband began a series of violent and even murderous assaults upon his wife and other people After another month he was certified insane and was received into a mental hospital, suffering from acute mania His health then improved and he was allowed out on parole from time to time On one of these occasions (in 1927) he told his wife that he had intended to kill her and to commit suicide He returned to the hospital but was discharged some five months after his first admission His wife was afraid to live with him when he came out In 1931, being at liberty and not under certificate, he came to the house where his wife lived and threatened violence to her and her family In view of her past experience she felt such apprehension that she applied for police protection In 1937 the husband was again certified, he had been under restraint ever since The accepted tests of cruelty in a matrimonial case are almost exclusively concerned with the effect upon the victim It was conceded that Mrs Astle had been the victim of cruelty, if cruelty were to be judged only from the point of view of the party who suffered from the acts complained of Mr Justice Henn Collins came to the conclusion that the husband by reason of disease of the mind did not know the nature and quality of the acts which he committed in 1927, at the time when he was committing them If intention on the part of the actor was a necessary element of cruelty in a matrimonial suit, there would be no cruelty so far as the husband's conduct in 1927 was concerned But those acts did not stand alone There was the threat in 1931, uttered at a time when the husband was at liberty The court found significance in the fact that for the ten year period, from the husband's discharge from the asylum in 1927 until his readmission, he had been sufficiently master of himself to refrain from committing violence, so far as was known The judge held that in 1931 the husband knew that he was uttering threats against his wife and was consequently responsible in law for what he then did The question then arose whether the isolated act of 1931 was so grave as to justify a decree in the wife's favour From the wife's point of view it was an act with an antecedent history With her past experience in mind, the threat had a reality and force out of all proportion to what it would have had if the husband had not already made attacks upon her life The earlier conduct must be taken into account not as aggravating the quality of the single act of cruelty but as aggravating its consequences For those consequences the husband was responsible although the judge had felt bound to acquit him of the

acts which gave them their gravity. Mr. Justice Henn Collins held that the wife was entitled to the relief which she claimed He granted a decree *nisi of divorce.*

BIOPSY OF THE ENDOMETRIUM

GYNÆCOLOGICAL endocrinology has been criticised for its empiricism, and it is true that we do not yet know enough about the minute structure of the endometrium at various phases of the menstrual cycle to make our treatment precise Misunderstanding or misinterpretation of the pathology of the endometrium must take blame for the disappointing results of endocrine therapy, quite apart from the impurity or the inefficiency of some of the preparations on the market And yet we have a method whereby we can assess ovarian dysfunction and control the results of treatment Biopsy of the endometrium is no new thing in the United States, and ISRAEL and MAZER have lately published [1] its results over a period of three years in 305 patients, 160 parous and 145 nulliparous, ranging in age from nineteen to sixty-four In this series only 2 fleeting reactions occurred and HERRELL has endorsed [2] their view that "office curettage" is safe in the hands of a competent gynæcologist.

The technique is simple. The patient is placed in a modified lithotomy position in the examination chair, her legs supported by suitable knee-rests. No premedication or anæsthesia is required. After swabbing the external genitalia with a non-irritating antiseptic, a small speculum (e g , Sims') is inserted and held by an assistant while the operator grasps the cervix with a light pair of volsellum forceps. Previous bimanual examination will have eliminated obvious lesions in the pelvis and established the size, mobility and direction of the uterus. To confirm this a sound is now passed Passage of the internal os may give rise to a complaint of slight pain, localised to the lower mid-abdomen, the external os and cervical canal are apparently insensitive to instrumentation The sound having been withdrawn the curette is passed up to the region of the fundus, a strip of endometrium from which is most likely to give a picture of the general histology Various types of instrument have been devised; a dexterous operator with a good sense of touch may find his needs met by a miniature curette of the ordinary pattern, but in America preference has been given to a hollow instrument with suction, and a uterine aspirator of this kind was described by LORINCZ and DAVIS in this country a few months ago.[3] The patient is warned that she may have a slight spotting of hæmorrhage and that her menstrual period may be accelerated if its appointed time is almost due at the time of curettage.

The indications for biopsy of the endometrium are many. Firstly, all endocrinopathies where pituitary or ovarian dysfunction is suspect or manifest, for instance, those cases of functional hæmorrhage in which organic disease of uterus and adnexa has been excluded, and sterility, and amenorrhœa The physician, let us suppose, is consulted by a woman, complaining of sterility, whose husband has been tested and found to be normal, the patency of whose tubes has been demonstrated with Lipiodol and whose menstrual history is not grossly abnormal. Biopsy of the endometrium on the twenty-sixth day of her cycle may reveal secretory changes in the endometrium indicating that ovulation has occurred and that the corpus luteum is functionally adequate. This is a useful positive finding If, however, the biopsy shows no secretory changes we may assume that the corpus luteum is functionally inadequate or that ovulation has not occurred The concurrent estimation of the patient's excretion of pregnanediol glycuronidate in the same cycle provides an additional check on the findings of the biopsy, and vice versa Secondly, the biopsy affords an irrefutable criterion of the efficacy of a particular dose of an endocrine preparation in a particular case; thus 50,000 units of œstradiol benzoate given on alternate days for a week may be shown by subsequent biopsy to have induced no proliferative changes in the endometrium, whereas in the same patient over the same period of time 2 mg of stilbœstrol by mouth may be shown to have caused well-marked proliferative reaction

The contra-indications for biopsy should be clearly defined It is not suitable for nervous virgin nulliparæ; it should never be done if there is any acute infection of cervix, vagina or appendages It cannot be recommended for occasional use by the practitioner. Asepsis, skill and gentleness are essential. When, however, biopsy can properly be applied it saves the patient and the institution both money and time. Take the case of a woman attending an outpatient clinic who complains of sterility, after certain preliminary tests it is decided to perform a diagnostic curettage. She is placed on a waiting-list, which will undoubtedly be long, and as she is not regarded as an urgent case she may be put lower down on the list. Perhaps months later she is written for without reference to her menstrual cycle, and the chances are four to one that her admission does not coincide with the secretory phase She may then be sent out and written for again, the bed being meantime wasted, or a curettage may be performed at the wrong phase of her cycle Contrast a case treated by biopsy. The cost to the hospital is practically nil, the cost to the patient is her travelling expenses, and the time consumed a few minutes The cycle having been previously plotted, the day is chosen which will yield the desired information at the convenience of patient and surgeon. The reluctance to enter hospital is circumvented; the after-effects of an anæsthetic are avoided; the procedure can be repeated as often as is needed.

Office curettage will not appeal to everyone But those who are dissatisfied with the present results of endocrine therapy, and who still feel that it may be the right weapon if properly applied, will welcome a method of simplifying diagnosis and of assessing results

MEDICINE IN KHARTOUM

In February, 1924, the Kitchener School of Medicine at Khartoum was opened On his last visit to the Sudan Lord Kitchener expressed a strong wish that medical training should be available for Sudanese students The proposal appealed strongly to the Sudanese and no less than £11,000 was subscribed by them towards the original scheme It soon became obvious that the students were not only extremely intelligent but also made efficient and reliable doctors The original object of the school was to turn out a small group of young men who could carry on the practice of medicine in the extremely trying climate of the Sudan The principle of the small group has been adhered to and as a result it may be doubted whether any medical students elsewhere in the world receive more individual tuition The report by Sir Alfred Webb-Johnson to the committee of management of the English Conjoint Board, mentioned elsewhere in this issue, gives an encouraging picture of the Kitchener school In its early days the school was fortunate in that Sir Henry Wellcome established in the Gordon College a group of laboratories for tropical agricultural and medical research It has now been wisely decided to separate these two branches The medical work is being carried on in the Stack laboratories close to the hospital and medical school, while the agricultural branch is at Medani in the Gezira where it is in immediate touch with the problems and difficulties which confront agriculturists in the Sudan Sir Alfred looks forward to the establishment of a university college in Khartoum embodying departments of arts, science, agriculture, engineering, veterinary science and medicine There can be little doubt that a movement will speedily develop for a university in Khartoum, and this deserves every encouragement With the decline of western academic influence in Egypt the importance of the Sudan as a cultural element in Africa may be expected to increase It therefore becomes doubly important that the development of a university at Khartoum should in no way be impeded

ANNOTATIONS

MORTALITY TREND IN DIPHTHERIA

Diphtheria, like other diseases spread by droplet infection, is probably quite as prevalent in this country today as it was forty years ago when compulsory notification was introduced During this period, however, certain other changes have taken place which have perhaps not received all the attention they deserve It appears that the spearhead of diphtheria's attack on child life has been moving gradually from the child of pre-school age to the child of school age Picken[1] two years ago, after pointing out that the earliest indication of this change was noted by Murphy[2] as long ago as 1907, showed that the shift of fatality to older children had continued—being particularly striking in London during 1932–35 He noted a similar change in Manchester and in Glasgow

Knowledge of this subject has now been put on a wider basis by Wright,[3] who has completed a valuable and comprehensive study of the clinical severity of diphtheria in seven cities (Liverpool Birmingham, Manchester, Glasgow, Leeds *Hull and Edinburgh*) over the period 1911–35 He finds that, though the incidence of diphtheria in the cities concerned shows fluctuation, there was a uniform and considerable decline in clinical severity as far as could be judged by case fatality rates During the final quinquennium (1931–35) of the study, however, the decline ceased, and in some places there was an increase in clinical severity which was independent of epidemics This general picture can be traced also within the various age groups of 0–4 years, 5–9 years and 10–14 years, but the decline in case fatality rates was proportionally less for the age group 5–9 than the age group 0–4 in all cities studied except Glasgow The shift of mortality to older children Picken was inclined to attribute to the more recently recognised type changes in the diphtheria bacillus itself Cheeseman, Martin and Russell[4] on the other hand have adduced evidence that reduction in the size of families, whereby children fail to encounter infection until school years, is primarily responsible, and improvement in the environment of young children also plays a part

Studies of this kind, apart from their value to the public health departments concerned, have general implications that should not be ignored If, as is suggested, the decline in clinical severity of diphtheria has now either ceased or been replaced by a rise, then a sharp stimulus towards active immunisation is required The well attested shift of mortality to older children also has a bearing on immunisation, indicating the desirability of immunising the child population as a whole, instead of concentrating on the very young

RADIOGRAPHY OF THE COLON

Examination of the several parts of the alimentary tract taxes the ingenuity of the radiologist The stomach and duodenum can be made empty by fasting, and their peristaltic movements are frequent enough for a series of pictures to be taken at short intervals after the barium meal when the changing contour of the opaque contents admits of diagnostic inferences When the rate of passage is quick, as it is through the small intestine, strial pictures may be obtained by using a thin barium impregnated paste For the colon the barium meal is supplemented by an opaque enema Both have their disadvantages By the time the barium meal reaches the colon it is mixed with residues of other meals, so that beyond the cæcum and ascending colon details of filling may be confused, and even for this part of the colon a supplementary opaque enema is needed The barium enema has the disadvantage of being given against the normal course of peristalsis, it may need a previous lavage of the colon to clear out food residues, moreover the ordinary movements of the colon are infrequent and spasm may confuse the picture In a recent study Rachet and Arnoux[1] point out that even two or three pictures taken at short intervals may not be really satisfactory for

diagnosis, nor do the methods of partial evacuation and air-insufflation preclude leaving a small lesion unnoticed. It is not often possible to have a further picture made within a few days or weeks; were this done opaque residues of a former barium meal would often be found in colonic diverticula. The authors therefore advocate taking a series of pictures while administering a drug which stimulates peristalsis. The technique they use requires lavage of the bowel with weak saline (15 per 1000) the previous night and early in the morning, a third wash of warm water being given if the second is not returned clear. The opaque enema, which must be quite homogeneous and of body temperature, is then given slowly under low pressure, air-inflation being used to distend the bowel. Twenty minutes earlier prostigmine has been injected subcutem to stimulate peristalsis. The patient lies in the same position for an hour during which exposures are made at intervals of ten minutes. By this method useful results have been obtained in the hands of the authors, who emphasise its help in precise diagnosis of the extent and operability, and even of the nature, of the lesion. It seems, however, that equally good results are obtained, with less strain on the patient and in shorter time, by proper orientation of X-ray tube, patient and plate, controlled by preliminary radioscopy and manipulation.

CONVULSION THERAPY AND ITS EFFECTS

MANY observations have now been made of the changes produced by Cardiazol in the brains of such animals as the guineapig, the rabbit, the cat and the dog, but the findings are less safely applicable to human beings than would be the results of similar studies in primates. Strecker, Alpers, Flaherty and Hughes[1] have now examined the brains of seven monkeys who had received intra-arterial injections of cardiazol in the doses and frequency usually employed in clinical work on schizophrenics. The experiment was intended to parallel closely cardiazol therapy, but there were divergencies, in that three of the animals died because of protracted convulsions, and in others seizures were of more than five minutes' duration, necessitating the injection of sodium Amytal to bring them to an end. In three animals no structural changes were found in the brain, in another there was swelling of the cytoplasm in the external granular layer of the frontal and parietal cortex, and in the remaining three subarachnoid hæmorrhage was observed over the cortex and at the base of the brain. Cells in the supra-optic nucleus of the hypothalamus showed in some of the animals loss of Nissl substance and vacuolation of nuclei. The investigators emphasise that those animals that had pathological changes in the brain had had, altogether, more minutes of active convulsion during the experimental period than the others, and that it had not been possible to demonstrate any subarachnoid hæmorrhage (by examination of the cerebrospinal fluid) in schizophrenic patients treated with cardiazol, probably because the duration of convulsions was so much less in them than it was in the monkeys. It seems likely, however, that it was not so much the total duration of the convulsions over the whole period of the experiment as the duration and severity of the individual convulsions that proved decisive in bringing on the rather gross changes found, in which case Strecker and his colleagues, instead of advising that the total number of treatments in a single case of schizophrenia should be limited to ten convulsions, might have taken it as the moral of their story that the dose of cardiazol given should never be such as to bring on a prolonged convulsion or, of course, repeated convulsions.

Any objection to cardiazol treatment based on the above findings and conclusions would presumably be raised still more strongly against picrotoxin, another convulsant drug recently introduced into the treatment of schizophrenia. A. A. Low[2] and his collaborators have tried this drug because they wished to avoid the terror of which patients complain after they have had cardiazol. Although picrotoxin can be used apparently without danger to life—they have given it to 38 patients intravenously, with no worse complications than subluxation of the jaw, dislocation of the shoulder, and fracture of the scapula—it is prone to cause repeated convulsions after a single injection. All but 2 of the 38 patients had at one time or another multiple paroxysms, and the patients who recovered were those who had fewer of these. From this it is concluded that the tendency to recover is in inverse proportion to a low convulsive threshold for the drug: no mention is made of the possibility that rapidly repeated convulsions may do cerebral damage of a kind unfavourable to recovery. Biochemical observations on the patients showed that the pH and CO_2 content of the blood, when two or more convulsions succeeded each other, tended to fall progressively with each paroxysm. Because of this the investigators decided to inject a barbiturate regularly after the second repeated convulsion to prevent further ones. It had also been observed that in the patients who had four immediately successive convulsions the sugar in the blood finally reached 210·4 mg. per 100 c.cm., and the white-cell count 34,300; the fasting level had not been restored an hour after the last seizure. In other respects the drug acted pretty much as cardiazol does, except that the patients found it less disagreeable, and there was an interval, longer even than that with triazol, between the injection and the first fit. On the whole, cardiazol seems preferable to picrotoxin.

BEST TEST FOR CLEAN MILK

SINCE 1929 a serious attempt has been made by the sanitary authorities in Italy to improve the cleanliness and safety of the milk-supply. The main test used in the control of bacterial cleanliness is the plate count. Increasing dissatisfaction, however, is being expressed with this method, and a search is being made for some more reliable substitute, among those receiving attention being the modified methylene-blue reduction test described by Wilson and his colleagues, now adopted officially for the grading of raw milk in England and Wales. Asdrubali[3] describes a careful examination of 120 samples of raw milk by means of the plate count, the Breed smear count, the modified reduction test, the keeping-quality test and the titratable-acidity test. The relation between the reduction test and the bacterial cleanliness of the milk as judged on the basis of the other four tests was then worked out. In 90 of the samples the plate count and the reduction tests were in good agreement. In the remaining 30 samples the results of the two tests were discordant, in 27 of these the reduction test gave the right and the plate count the wrong answer. Very striking were the results of the reduction and the keeping-

quality tests, the relationship between them proved almost linear Duplicate comparative tests made between the plate count and the reduction test on the same samples of milk by two or more workers yielded complete agreement in the reduction times, but often very great disagreement in the plate counts On the same sample of milk, for example, counts of 3000 and 400,000 were obtained Reviewing his results in the light of previous work the author concludes that, on account of its sensitivity, the constancy of its results, its low cost, its simplicity and the rapidity of its performance, the modified methylene-blue reduction test could be advantageously used to replace the present plate count in the examination of raw milk Ciani [4] has explored the possibilities of using the modified reduction test for controlling the bacterial cleanliness of pasteurised milk He examined 139 samples of pasteurised milk by the plate count, modified methylene blue reduction and keeping quality tests His results were similar to those of Asdrubali on raw milk He found that the plate count gave highly irregular results and showed a much lower degree of correlation with the keeping quality of the milk than did the reduction test From his experience during the past two years he is confident that the modified methylene blue reduction test could be satisfactorily used instead of the plate count to control the bacterial cleanliness of pasteurised milk His findings are of considerable interest, since Wilson and his colleagues were cautious in expressing their opinion on this point They did not regard the reduction test as suitable for the control of pasteurised milk immediately after processing, though they thought it might be used for testing the bacterial cleanliness of milk as delivered to the consumer It is presumably the latter type of milk with which Ciani has been mainly concerned, though his data on the time at which the samples were taken after processing are not explicit The general conclusion of both the Italian workers seems to be that for the control of raw and pasteurised milk of the quality at present supplied the modified methylene-blue reduction test has considerable advantages in the way of sensitivity, accuracy and simplicity over the plate count method

OPIUM IN THE FAR EAST

PREPARED opium, or opium to be used for smoking, has been engaging the serious attention of the advisory committee of the League of Nations which deals with the traffic in narcotic drugs It appears that at Hong Kong the opium sold by the monopoly amounts to only a twenty fifth of that sold illicitly, and that the high price charged for the former renders smuggling highly profitable thus confirming the finding of the commission of 1930 which reported on opium smoking in the Far East The question of prices is being studied by the British Government, in conjunction with the colonial authorities It will be remembered that a not inconsiderable proportion of the revenue of some of our far eastern colonies has been derived from the sale of opium

In Shanghai, according to the United States representative control of the traffic in opium has broken down completely except in the French concession and the International Settlement Huge quantities of Iranian opium are said to have arrived in Shanghai and in north and south China consigned to Japanese firms At the end of December, 1938 it was estimated that the amount of opium consumed daily in Shanghai was approximately 5000 taels of which 2000 were Iranian opium It was further alleged that the Mitsubishi Company had received instructions from Tokio to purchase 200 chests (18,907 kg) for Kwantung and 1600 chests (109,080 kg) for the Manchukuo government The sale of opium was the largest source of revenue in Manchukuo after the customs receipts The American representative also reported that all varieties of habit forming drugs are purchasable within the Japanese concession in Tientsin, where opium dens, in nominally Chinese controlled areas, abound The U S government, he said, have proof that heroin discovered in illicit traffic has since 1935 come in large measure from the Japanese concession Moreover, large seizures of *smoking opium (for which there is no* market in China), coming from the Far East, have recently been made in the States The representatives of India, Canada, Egypt and Belgium associated themselves with the expressions of grave concern regarding the situation The advisory committee noted with regret that there had been no improvement during the past year and proposed to communicate its report to the various governments

A DUTCHMAN LOOKS AT ENGLAND

Petrus Camper was born of wealthy parents at Leyden in the year 1722 He grew up in an atmosphere of cultured ease Boerhaave was a friend of the family and his father was a patron of the scholars and artists of the day He was entered at the University of Leyden in his twelfth year, but did not graduate in his chosen subjects, medicine, mathematics and physics, till he was twenty four He was no mean linguist and was able to speak and write French, German, English and Latin, and to understand Italian In 1746 Camper settled in Leyden as a general practitioner He was already specially interested in obstetrics, and in 1748 fired by eulogies of William Smellie, he determined to visit England with the express purpose of becoming one of Smellie's pupils

Smellie was then the most celebrated obstetrician of the day With William Hunter as his assistant he devoted much of his time to a series of lectures and demonstrations, which were attended by a stream of eager learners Camper at once placed himself under Smellie's tuition He paid the modest sum of three guineas for a three months course, and jotted down in a variety of languages an elaborate summary of the lectures, interspersing remarks of his own on what he heard, and often also what he spent and the names of those whom he met This constituted the first of his three diaries which have now been published [1] After his return to Holland he made a fair copy of the notes in Latin In the intervals of his attendance on Smellie, with whom he quickly became on intimate terms, he took lessons at a school of painting, at which leading artists gave instruction in life drawing One of his sketches of this period is reproduced in this volume and shows considerable artistic skill. Towards the end of his stay he made a series of excursions, visiting Oxford, Cambridge, Bath, Bristol and other places He was everywhere received by the learned men of the towns he visited, in Oxford and Cambridge he made friends with whom he corresponded for years He next went to Paris, but the records of his stay are meagre When he left Paris he found that he had in his absence been

[1] Opuscula Selecta Neerlandicorum de Arte Medica Ediderunt quinta-decima quam Curatores Musei Academici quae vocantur Nederlandsch Tijdschrift voor Geneeskunde collegerunt et ediderunt Amstelodami Societatis 1939 Pp 264

appointed to a professorship at the University of Franeker, and for the next few years devoted himself to teaching there

In 1752 he availed himself of the six-weeks vacation to pay a second visit to England. He took lodgings near Smellie and spent a great deal of his limited time working with him. He made a number of drawings for Smellie's book. The only relaxation he allowed himself from his medical studies was a visit to an old friend Dr Thomson of Worcester. He was soon back at work in Franeker, and three years later had gained so great a reputation that he was invited to Amsterdam as professor of anatomy and surgery. There he stayed for six years and then, at his own request, was relieved of his duties and retired to his wife's estate in Friesland with the title of honorarius. His retirement however did not last long, for in 1764 he accepted an offer of a chair in medicine, surgery, anatomy and botany at the University of Groningen. This he held for nearly ten years and then again retired from active teaching, though not apparently from practice or the enthusiastic study of natural science. At last in 1785, thirty-three years after his second visit, he again came to England, this time as a man of international reputation. He devoted the whole of his two months' stay to intercourse with the most distinguished men of science, who received him everywhere with the greatest warmth. He made many drawings of specimens of natural history at the British Museum, at Oxford and elsewhere, some of which are reproduced He was at this time greatly interested in the operation of symphysiotomy and one of the motives for his visit was the hope of inducing some of his English confrères to abandon their opposition to it. His last entry in the journal is both illustrative of his general interests and of his position in London. "In the evening I had the honour to be visited by Mr. West, his son and a friend, an American Quaker, who drank tea and punch with me. They inspected my drawings with intelligence, and seemed to like them . . . We discussed the nationality of Americans though of European blood We agreed that the distance from the eyelid to eyebrow was certainly small. That in Jews the nose is curved and flat at the point, the mouth drawn up, in one word that they show most resemblance to the goat's head" Camper was certainly an outstanding physician of his time and his English travels are of great interest both to our profession and to the general reader, and we owe a debt to our Dutch friends for making them available to us in this attractive book.

PHYSICAL EDUCATION FOR STUDENTS

ON July 19 the University of Edinburgh granted its first certificates for physical proficiency to two students who had taken the university course and examination in physical proficiency. This event marked a further stage in the campaign for making physical education an integral part of an academic university training As was noted recently in our columns,[1] Colonel Ronald Campbell, director of the university department of physical training, has been aiming at something other than mere athletic efficiency. In order to find out the state of mind of the hard-working student, the Colonel himself attended lectures in psychology, anatomy, physiology and moral philosophy This enabled him to plan a type of training which would revitalise the mind after a spell of mental concentration and put it once more into a receptive mood ready for the next class. That this empirical method was justified is shown by the results During the first few years of the scheme, nearly all the students who came to the gymnasium were members of the athletic club. Now there are as many if not more students who do not play games. At present about 20 per cent. of the men students are taking the voluntary course, which consists of not less than thirty classes in two consecutive sessions The tests used to assess physical ability are varied Agility is tested by running, jumping and vaulting, strength by gripping, climbing and lifting; and dexterity by throwing, catching and hitting The tests are adapted from those used in the Army, but are less specialised and more suitable for civilians of any age. Colonel Campbell considers that the average student who attends a class twice a week for four terms spread over two years should reach certificate standard, while the subnormal student should reach the required standard in three years It is claimed that students who gain most from the course are not necessarily those who obtain certificates Two large firms (Mather and Platt of Manchester and I C I.) have adopted the Edinburgh system of training for their apprentices and staffs.

SOIL POLLUTION

CESSPOOLS and privies are potential sources of pollution of both surface and subsoil waters and all who have to do with rural sanitation should read three papers[1] by Elfreda L Caldwell describing studies made at the field research laboratory of the Alabama department of health The pollution of a permeable subsoil from a pit latrine is first considered. To investigate this Miss Caldwell had a pit dug about 3 ft. square and 8½ ft deep in a fairly level field on a plain along the southern bank of the Conecuh River. The pit was sheathed with boards loose enough to permit outflow of sewage, and with two sampling wells dipping respectively about 3 and 4 feet below the bottom Eight encircling wells were also dug dipping about a foot below the bottom of the pit. The whole was covered with a layer of concrete, except for a central aperture in which the excreta of a family of nine were dumped daily. The general direction of flow of ground water was ascertained by preliminary experiments with strong salt solutions by a method described in one of the papers by Caldwell and Leland W. Parr, and across the line of flow were arranged a series of tube wells, some fixed, others driven in at places which the course of examination showed to be suitable Observations of the level of the water-table in the soil and suitable meteorological observations were made during a preliminary period of some months as well as in the period when excreta were added. During the preliminary period bacteriological and chemical analyses of the ground water drawn from the wells were made, and these were repeated at intervals during the experimental period The results illustrate the value of both bacteriological and chemical examinations, a point appreciated long ago by Houston Under varying conditions of water flow in the soil and height of water level chemical evidence of pollution was obtained 100 to 300 feet downstream in the soil water, the distance increasing as time went on. On the other hand bacteriological evidence was only obtainable for a few feet, the distance after a slight increase decreasing with time The probable explanation is the adsorption of bacteria and other particulate matter on the soil particles with consequent increase in efficiency of filtration Absence of dissolved oxygen

1. *Lancet*, July 8, 1939, p 106.

1 *J. infect Dis* 1938, 62, 225, 259, 272

in the soil water was a feature of the more polluted samples The value of bacteriological tests for indicating danger and of chemical tests for showing the possibility of bacteriological pollution are well brought out In the third paper Miss Caldwell studied subsoil pollution in relation to possible contamination of the ground water from human excreta deposited in experimental latrines, finding that pollution was normally in a downward direction, that it followed the direction of flow of water in the soil, and that it was much less from a pit used only for excreta than when water was added Obviously a dry system is safer than a leaky cesspool Sludge digestion, such as occurs in a septic tank, with consequent alteration of the bacterial flora of the peripheral layers in the pit, accounts for the small distance travelled by intestinal bacteria from the place of deposit Although the chemical substances indicating pollution are themselves harmless it would seem wrong, notwithstanding the way in which bacteria generally get held up in transit, to bore wells anywhere within the zone of soil water flow where chemical evidence of pollution is obtainable

THE PRINCIPLES OF FOOD HOARDING

In the crisis of last September as during the opening weeks of the late war, many well to do householders purchased, or attempted to purchase, large quantities of flour, bacon, sugar, tea and other commodities Because such action might have led to an immediate shortage of food, which would press more severely on the poor than on their more favoured brethren, it was stigmatised as "food hoarding" and frowned upon Retailers, either on their own initiative or upon prompting from the Government, refused to sell more to any household than this household had been accustomed to purchase in the past Food hoarding was definitely taboo In February, however, the President of the Board of Trade "saw no objection to the accumulation by householders in peace time of small reserves of suitable foodstuffs equivalent to about a week's normal requirements' and hoarding within these limits has become respectable, though until recently no serious attempt was made to tell the public what and how much they ought to store

Food storage has a double aspect—national and individual The national aspect has been dealt with in a publication of the Air Raid Defence League[1] which advocates storage in the land by accumulation of fertilisers, fodder and live stock, Government purchases of large stocks of wheat, sugar, oils and vital raw materials and the accumulation of stocks by wholesalers retailers institutions, and, when possible, householders The collection of a supply of wheat is recommended On the outbreak of a war shipping of fodder for animals would have to be drastically curtailed pigs and store cattle would be slaughtered for food, and reliance for meat would be placed on sheep not bullocks, though dairy cows would be retained for milk production The quickest return in food comes from cultivating potatoes and the next quickest from wheat whereas the production of milk is naturally much slower, and of beef slower still There is as yet little sign of preparation for a swing over to increased production of potatoes wheat and milk and no sign that the public mind is being prepared for such a change

What more concerns the average head of a family is the need for his household to lay in supplies of non perishable food The function of such hoarding is to tide the family over the period of dislocation of food supplies during the first week or fortnight of a war The well to do householder who lays in a week or two's needs as iron rations will do some thing to prevent the panicky purchase of extra food which accompanies a crisis or an actual outbreak of war Prices of foodstuffs will then be less likely to rise if he need make no immediate purchases and those who were unable to store food will not be penalised for their poverty or lack of accommodation The natural dislocation of food supply till the Government can take over food distribution will be minimised It is therefore reasonable for the householder to lay in a store of foods which will keep well and can be drawn upon to support his family during the early weeks of a possible war The British Medical Association has provided scientific advice[2] and the Lord Privy Seal has distributed some simple suggestions[3]

Foods which produce energy—and they are largely the storage products of plants or things manufactured from them—are naturally the ones which are least perishable, such as wheat, flour, biscuits, pulses and sugar The body building foods such as meat, fish, cheese, milk and eggs, are more perishable; and the protective foods, such as dairy foods, summer fruits and raw salad vegetables, are the most perishable of all Fortunately, as is shown by the discussion reported on p 373, there are methods of preservation which will leave some of these foods with their full value even after a year As sources of vitamin C we may recommend tinned black-currants and black-currant purée tinned tomato purée and tinned orange juice, but it would be well if the firms who put up the foods would take the public into their confidence about the amount of vitamin C in them expressed either absolutely or in terms of a day's ration Vitamins A and D in canned herrings, sardines and salmon probably keep indefinitely

---

Dr A J CLARK, F R S, professor of materia medica in the University of Edinburgh, and Dr T R ELLIOTT F R S, emeritus professor of medicine in the University of London and consulting physician to University College Hospital have been appointed members of the Medical Research Council in succession to Prof H S Raper F R S, and Prof J A Ryle who retire on Sept 30

Mr FRANK ROMER who died in London on Monday at the age of 68 was well known for his successful treatment of athletic and sport injuries

"THE TEETH OF THE NATION ARE ROTTEN"

THE Minister of Health is informing the public that caries has the nation in its grip Last year, in opening the Public Health Services Congress, he said, "The teeth of this country are bad You might almost say the teeth of this country are rotten" A few weeks ago he repeated his grave statement. In his presidential address to the British Dental Association[1] on Aug. 1, Mr T. R. D. Walkinshaw took up the tale from the association's point of view. The problem, he admitted, was a very real one, but the blame must really be laid on our half-hearted public dental-health service. The body, if out of the care of the panel doctor for a year or so, does not inevitably decay. With the teeth, on the other hand, this unhappily seems to be the case. A dental service, to be of any value at all, must be continuous. Otherwise, in a couple of years away from the dentist, the value of hours of previous careful conservative labour is lost.

Officialdom has always been loth to admit that the nation has teeth which need caring for. Forty years ago, Mr. Walkinshaw said, at the outbreak of the Boer War, there was not a dentist in the whole of the British army. In the B.D A 's museum is a letter from the War Office replying to the late Captain A. F. A. Howe's offer of his services as a dentist to the troops in South Africa; in it the War Office stated that it was not necessary to send a dental officer to the front Yet it is on record that 2450 men were invalided home as unfit for further service, on account of dental disability, and that another 4500 were admitted to hospital and were later returned to nominal duty "to be kept within reach of soft food." Inspection of the mouths of one draft of soldiers revealed a serious condition of their teeth, and instead of the obvious remedy—dental treatment—the War Office gave orders for the immediate supply of mincing machines! Two large-size machines per company were therefore sent up from the base! It was some time after the end of the war that a feeble attempt to deal with the matter was made by the appointment of 9 dental surgeons, but, for economy, even this puny attempt at a dental service for the Forces was discontinued At the outbreak of the Great War the British army was again without a dental surgeon Eventually dentists were given temporary commissions in the R A M.C, and Mr Walkinshaw congratulated the B D A on its persistent efforts, which resulted in the establishment after the war of the Navy, Army and Air Force dental branches Unfortunately their conditions of service leave much to be desired and the number of recruits and trained men per dental officer is too high to permit of the maximum efficiency being achieved.

THE TEETH OF CHILDREN

The school dental service was started in 1908, yet now, although there are over 900 whole- and part-time school dentists, the dental condition of many school-children is little better than before Most school dental schemes are so seriously understaffed that there is little time for thorough conservative work and less for educative work. It is not the technical standard of the school dental service which is at fault, but the rushed conditions make anything approaching a true preventive service impossible. Last year the number of dentists in the school dental service was one for 6000 children, although the Board of Education suggests a ratio of one to 5000 children in urban areas and one to 4000 in rural The B.D A., however, holds that to ensure complete treatment there should be one dental surgeon to every 2500 children. Cambridge has one dentist per 2250 children; Croydon one per 5700 children; and another area one per 7000 children. In Cambridge practically every child was examined, 75 per cent needed treatment, and all but 2 per cent. received it. In Croydon 13 per cent. were not examined, and of those who were 75 per cent needed treatment which more than half of them never received. In the unnamed area only 41 per cent were examined and of these, strange to say, less than half were said to need treatment. This absurdly low figure is no doubt due partly to the shortage of staff and possibly to a lower standard of inspection being adopted in an effort to deal with the whole school population. In 1937 there were over 4½ million school-children in England and Wales About 3¼ million were dentally inspected, and of these approximately 2½ million required treatment, but only 1¼ million received it, so that about 1 million went untreated Assuming that of the 1 million who were not inspected the same proportion required treatment, then about 1¾ million who needed dental treatment did not receive it. Every year about 2½ million temporary teeth and more than half a million unsavable permanent teeth have to be extracted at school dental clinics The present service is now costing the country about £1,000,000 per annum To provide a complete school dental service on the present system it would apparently be necessary to spend twice this sum.

EARLY PREVENTIVE TREATMENT

Unfortunately the whole structure of the Board of Education's school dental treatment scheme, Mr. Walkinshaw thought, is built on a foundation of sand Immunity from dental disease can only be obtained by early preventive treatment. The effort must begin by attention to the health of expectant and nursing mothers, and the teeth of children under school age. The 1918 Maternity and Child Welfare Act provides that a local authority *may*—not *shall*—make arrangements for attending to the health of expectant and nursing mothers, and children who have not attained 5 years of age There are no statistics showing the number of authorities giving dental treatment for expectant and nursing mothers and young children, although steps are being taken by the Ministry of Health to require local authorities to submit details In the north of England at least, provision of dental treatment for mothers and children is conspicuous by its inadequacy or entire absence Until the problem of the pre-school child's dental health is tackled, the dental treatment in the school services will be handicapped and retarded If the pre-school child received dental attention, the school dental officer's work would become more effective and gross irregularities due to early loss of deciduous teeth would be greatly reduced The average child entering school has teeth in an appalling condition, so that during the first few years of school life the time devoted to dental treatment is largely taken up with removal of septic temporary molars

Besides the failure to provide adequate dental treatment in nursery schools there is the failure to provide dental treatment during adolescence in the gap

1 *Brit dent J* 1939, 67, 115

between school leaving age and entry upon insurance benefit At its least the gap appears to be two and a half years, and in some approved societies dental letters are certainly not issued to members until they have been contributors for five years In such circumstances a child leaving school at 14 is not eligible for dental benefit for seven years Adolescence is known to every practising dentist as the age when dental caries is most active, and when periodic attention to the teeth is more necessary than during any other period of life The recent Juvenile Contributors' Act provides that a child at the age of 14 or more years, on entering an insurable occupation, shall at once be entitled to statutory *medical* benefit, but so far no provision has been made to include dental treatment, although on the second reading the Minister undertook to examine the possibility of reducing the waiting period to one year Anything, said Mr Walkinshaw, more wasteful than the institution of a system of dental treatment given throughout the school life and then allowed to drop entirely during the period of adolescence would be difficult to imagine The net result of all this is that when the ex school child has reached maturity the conservative work of the school service is entirely nullified and the money spent by the state largely wasted Those who examine the teeth of recruits to the Navy, Army and Air Force today say that what they see makes it difficult to believe a school dental service has been in existence for thirty years, it is rare to find any evidence that these men have ever received dental attention

A BREAKDOWN SERVICE

Dental benefit under National Health Insurance has the unenviable title of a breakdown service As an additional benefit, it is dependent upon the existence of a surplus Approved societies having a large sickness claim have little surplus, and the very people who need dental treatment most cannot get it as a benefit The vast majority of societies offer only 50 per cent, leaving the insured person to pay the balance—often a difficulty for the adult wage earner, and an impossibility for the insured adolescent Unlike medical benefit it is not statutory, and dental benefit is sought only on medical advice or for the relief of pain Further there is no regular inspection and treatment, and the approved societies often raise difficulties when insured persons apply frequently for dental letters Prophylactic and conservative treatment is discouraged, and it is estimated that over 80 per cent of the annual expenditure on dental benefit under the N H I Act is represented by the cost of extractions and dentures This costs the nation about £2,000 000 per annum, apart from the proportion paid by the patients themselves, and achieves said Mr Walkinshaw nothing as a contribution to health and fitness in the young men and women of the nation, who will be the parents of the next generation If the teeth of the nation are rotten " then no one should be better aware of that fact than the Minister of Health, whose department, in conjunction with the Board of Education must share the responsibility of their failure to exercise the wide powers both possess

---

THE number of inquests held by coroners in the county of London continues to decrease, and the L C C consider that the number of coroners' districts should be reduced from six to five The coroners of London agree with this view If the Secretary of State approves the existing central and the southern districts will disappear and a new south western district will be created The new arrangement will save about £1700 a year in salaries

KITCHENER SCHOOL OF MEDICINE, KHARTOUM

AT the request of the committee of management of the English Conjoint Board, Sir Alfred Webb Johnson visited the Kitchener School of Medicine at Khartoum during the final examinations in January, 1939 In his report he stated that, in addition to the care of the sick, the Sudan Medical Department shoulders the responsibility not only of controlling endemic and epidemic infective diseases but also of guarding against importation of infections from across the frontiers Perpetual war is waged against the insect vectors of infecting agents and the keenest vigilance is exercised over the steady stream of aircraft which bring distant countries within a few hours' journey of the Sudan These considerations influence the teaching in the medical school, they lead to a close link between therapeutic and preventive medicine The doctors are supplemented by a host of subsidiary officers working in native villages where, for economic, social and psychological reasons, no qualified medical man could be expected to live In dispensaries and dressing stations these subsidiary officers, who have had considerable training as hospital orderlies and have passed a special examination act as outposts for the treatment of minor ailments and as scouts to give warning of suspected infection Inspection of these units, which are all based on general hospitals, showed the system to be satisfactory and effective and definitely preferable to peripatetic mobile units paying occasional visits to various districts

EDUCATION AND EXAMINATIONS

Last year it was arranged for the first time for the pupils of Gordon College to enter for the Cambridge School Certificate Slight modifications were very sensibly made to meet local conditions Arabic took the place of English as the native tongue and English was counted as a foreign language and was made an obligatory subject Of the 22 pupils entered for the examination 20 gained the certificate, and 16 reached matriculation standard

The students for the medical school are selected from among the most successful pupils of Gordon College, they are given their medical education without charge, they have to live in a students' hostel for which again no charge is made, and they are given an allowance of £E1 per month Inefficient students are weeded out in the preliminary and intermediate parts of their training The new students admitted in any one year are never allowed to exceed ten in number The original objective was to reinforce the Sudan Medical Service by about six newly qualified doctors each year At present about half this number is attained. The limitation of numbers leads to a high standard of individual tuition The students work very hard, and never require any stimulating —on the contrary the Registrar has to insist on a less serious concentration on reading

THE FINAL EXAMINATION AND THE POSTGRADUATE

It was a unique experience for an examiner to find that, of seven candidates taking all three clinical subjects at one time only one failed to obtain a pass mark and then only in one part of the examination The pass mark was 60 per cent and the standard was severe There is no clinical examination in obstetrics but this will be arranged for at the next examination The papers were very legibly

written and the English was well composed and spelling good. This is largely the result of the excellent teaching at Gordon College. Instruction in English is to be continued in future during the two science study years, so that an even higher standard is expected. The viva-voce answers were clear, straightforward, and to the point, and the candidates were quick and ready in discussion The students are well trained in clinical methods, they examined patients very thoroughly and methodically. They displayed a refreshing reliance on careful clinical examination instead of making an immediate demand for X-ray and laboratory assistance before attempting a diagnosis.

Successful candidates are enrolled in the government service, but before being appointed to independent posts they have to serve for two years as resident house officers at one of the large general hospitals. After ten years they must return to Khartoum for six months' postgraduate study. The fear that so much individual tuition may produce doctors who are not sufficiently self-reliant has, in the judgment of those in control, proved absolutely groundless

THE MEDICAL SCHOOL AND LABORATORIES

The medical school is well equipped and the laboratories are excellent in every way. There is a good library, which is more than adequate for the needs of the students, but, as it is hoped to make it a circulating library for the officers of the service, gifts of books will be greatly appreciated In the Stack laboratories, instruction is given in pathology, bacteriology and parasitology, the routine work of the hospitals is carried out, and special investigations are made if required from any part of the Sudan. In addition, lymph for vaccination against smallpox is prepared, as well as anti-rabies vaccine and many other protective inoculations. A large amount of research work is carried out, and the department is directed by Dr E. S. Horgan. A railway coach has been equipped as a mobile laboratory.

MATERNITY WORK

Owing to national customs and prejudices it is difficult for the students to attend maternity cases in patients' homes, but the number of deliveries they see and actually attend is steadily increasing There is an admirable school of native midwives which is conducted at Omdurman Two British ladies, qualified as nurses and midwives, here instruct native women in the essentials of efficient and cleanly maternity work An antenatal clinic is held at the school, and the pupils are taken out to cases after preliminary instruction in theory and practice. Most of the pupils have never even seen a pair of scissors, and have to be instructed in their use, so that it is astounding that they can be trained as useful midwives for outlying country districts in so short a time as six months.

THE FUTURE

Great developments are planned for the improvement of education in the Sudan Gordon College, which was originally a vocational primary school, has grown into a vocational secondary school. Its pupils are to be moved to new buildings to the north of Omdurman and at Medani The college buildings will then be available for centralising the several departments of advanced education which have developed in different parts of Khartoum A centre of university-college standard will thus be established. The departments of arts, science, agriculture, engineering, and veterinary science and the Kitchener School of Medicine should all be brought under the control of this centre, which would soon develop a university spirit Any delay in carrying out this natural development will only be putting the brake on the inevitable Immediate steps therefore should be taken to perfect an organisation so that, directly the buildings of Gordon College are available, the Gordon University College can be launched No doubt this will soon be followed by a movement for the establishment of a university in Khartoum, and this movement should be encouraged in every way.

In the hospitals of Khartoum and Omdurman there is bed accommodation for 650 patients; the number is shortly to be increased to 750 The old hospital on the river front, which is some distance from the medical school, is to be demolished. The director's offices are to be moved into the present civil hospital next to the medical school, and a new hospital is to be built on the eastern part of the site Thus a 500-bed hospital will be erected in the immediate vicinity of the Stack laboratories and the medical school with great advantage to medical education. With the special women's hospital and the new men's hospital at Omdurman and the hospital in Khartoum there is ample opportunity for clinical instruction and practice.

RESULT OF THE REPORT

The comitia of the Royal College of Physicians of London and the council of the Royal College of Surgeons of England have adopted the following recommendations, suggested by the committee of management on Sir Alfred Webb-Johnson's report:—

1 That, subject to a special recommendation from the Director of the Sudan Medical Services, a graduate of the Kitchener School of Medicine, Khartoum, who has completed not less than two years' hospital experience subsequent to qualification, be exempted from the First Examination and be admitted to the Final L.R.C.P., M.R.C.S. Examination on completion of twelve months' practice in a recognised medical school and hospital in this country

2. That a graduate of the Kitchener School of Medicine, Khartoum, be admissible to the examinations for the several postgraduate diplomas granted jointly by the Royal Colleges on complying with the regulations for admission to these examinations.

NEW ZEALAND

(FROM OUR OWN CORRESPONDENT)

SOCIAL SECURITY AND THE DOCTORS

THE present lull in the contest between the Government and the medical profession, organised as the British Medical Association, affords an opportunity to review the situation About August, 1938, the first Labour Government, towards the close of its third and last year of office, passed its Social Security Bill This bill had two main objects It was intended to substitute for the existing non-contributory civil pensions, monetary benefits on a contributory basis. It also provided for a system of medical, hospital, and related benefits The money was to come from a new social-security tax of 1s. in the pound, payable by practically everyone in the community; it replaced the old unemployment levy of 8d in the pound, payable by a more limited clientele. The social-security tax came into force on April 1, 1939, and is being regularly collected. The medical benefits were to consist of a general-

practitioner service available to every person in the community Maternity benefits available to all were limited to such service as a general practitioner ordinarily gave Pharmaceutical benefits were to include all ordinary prescriptions and appliances Hospital benefits were to consist of the payment to the hospital (whether public or private) of part of the fees charged to the patient Actually this sum has been fixed at 6s per day (public hospitals charge about 15s a day) and payments began on July 1, 1939 Apart from these four benefits, the bill fore shadowed, but did not provide for, a number of others, for example radiological, laboratory, anæsthetic, specialist and consultant, dental, ambulance, home nursing and domestic assistance

The New Zealand branch of the B M A is the only important organisation of medical practitioners in the islands, and includes about 90 per cent of all doctors on its roll All sections of the profession belong, including consultants who figure prominently as local and national officers The B M A for several years had been studying forms of health insurance and had, long before the Social Security Bill was passed, adopted and published its official plan This plan outlined a scheme of service for the more needy, though an income-limit was never actually fixed The service was to be a complete one, including general practitioner, specialist, consultant, radiological, laboratory and other services with emphasis on preventive medicine The G P section was to be organised on a "panel" basis and the other services on part time paid attendances by consultants at hospitals or elsewhere It was generally recognised that, owing to the more equal distribution of wealth in New Zealand, any wage limit likely to be agreed to by the Government would include 70 or 80 per cent of the people in the scheme

In the months preceding the passage of the bill, there were numerous conferences between ministers, officials of Health Department, and B M.A repre sentatives These conferences were largely abortive, the B M A representatives insisting that the Government would never disclose their intentions as to the kind of service proposed, and further that the Government had not had expert advice on either actuarial or medical aspects, they therefore could not offer to coöperate It was said that the bill was actually passed before the B M A representatives were informed of its contents A deadlock was thus reached, the B M A refusing to discuss the matter further and calling upon all its members to sign declarations vesting in their local representatives their right to accept or refuse contracts offered These declarations were signed by a goodly majority of practitioners, and donations were collected for a fighting fund Everything then seemed to depend on the result of the General Election in October, 1938 If the Labour Party went out, the B M A 's fears would perhaps be at an end (although it was remembered that the National Party had on its programme a national health scheme before it went out of office in 1935) If it did not, no one cared to think about it Social security was a prominent feature of the election campaign After a hot election, in which the medical profession was used in the attempt to defeat the Government, the Labour Party was returned to power stronger than ever, with an absolute majority in the House When the summer holidays were over in January, 1939, the Minister of Health, the Hon Peter Fraser, reopened negotiations with the B M A to try to get the bill working as promised on April 1, 1939 The deadlock continued, as the B M A refused to exercise its rights in sending members to the central medical committee In March the minister circulated documents to medical practitioners describing the bill and its benefits The rate of remuneration for G P service was not specified, nor its manner of distribution It was simply to come from a central practitioners' fund, which was to be formed either on a capitation basis, or on an estimated amount of service basis Many general practitioners feared the panel basis, even as promulgated by the B M A, and began to press for "payment for services rendered," for which certain ministerial statements seemed to give encouragement

In April it was announced that a beginning would be made with the maternity benefits and an offer of contract was communicated to all practitioners by the minister Only 22 in the whole of New Zealand accepted the contract, the terms of which were generally held to be very irksome to both practitioner and patient It was also objected that there was no provision for consultant help, and some thought the fee of £5 per confinement with attendance before and after was inadequate The B M A expressed approval, as an alternative of a cash payment to the mother, allowing medical arrangements to go on as at present Maternity benefits, as far as they concern nursing homes, are now in operation, together with the medical portion served by the 22 doctors Hospital benefits began in July There is at present (mid-July) a lull on all fronts There is no word of the introduction of medical (G P) or pharmaceutical benefits Meanwhile the minister of finance continues his prolonged conferences in London with Mr Montagu Norman and other authorities, and the country awaits word as to length of rope to be allowed

Quot homines, tot sententiæ Neither side seems to have done much serious thinking about the medical problem in New Zealand The public hospitals are in a low state of efficiency and cling to the ectopic honorary system which has never been suitable for New Zealand The hospital boards, elected locally, have always been of poor calibre and lack coördination on a national basis The profession while individually fairly competent, lacks leaders of vision and insight, having exported its best medical and scientific brains for many years past It can claim practically no output of thought or research, and is content to retail the work of others It makes no effort at public enlightenment, preventive medicine, or fruitful contacts with education, agriculture, or social life generally The Government show no outward sign of enlightenment in medical matters Their proposals are devoid of inspiration, and seem to aim at reorganising the mode of distribution of medical services, accepting their present quality as satisfactory The approach is evidently almost purely political, and this is probably the reason for their inability hitherto to think of reorganising the hospital system of the country This reform is the first necessity But to carry it out would mean shaking the entrenched system of local politics The people are not very vocal Certain women's organisations pass resolutions supporting the doctors, but there are many signs of dissatisfaction with the status quo Individually doctors are liked, but as a body they are a popular target The large public hospitals are openly acknowledged to be bad by the general public Conditions of medical service in rural areas fall very far short of what they might easily be, through lack of organisation There is a mild general scepticism as to the value of the social security benefits, but the tax is collected, and the

people will want to see something for their money The outcome is hard to visualise. Politics will have to be given less importance by both sides if useful progress is to be made. Perhaps however a world-wide cataclysm will overwhelm all traces of this little controversy.

EPIDEMIOLOGY OF VIRUS DISEASES

In a paper read at the annual conference of health officers and public-health nurses of New York state Prof John E. Gordon of Harvard calls attention to the differences in the epidemiology of virus and bacterial infections. Several hundred virus diseases have now been described—almost no form of life is free from them—and the remarkable increase of information about the filtrable viruses during the past ten years has changed our ideas about the spread of infection Professor Gordon points out that the fact that viruses are filtrable and invisible agents limits the application of certain common epidemiological methods On the other hand, viruses are obligatory intracellular parasites and this sets a boundary to their activities and governs their behaviour. We cannot tell whether they are autocatalytic agents or living organisms, and the question has been raised whether we can control the infectious diseases for which they are responsible if they are fabricated in the host. Professor Gordon contends that this fear is a bogy: there is no more reason to believe in spontaneous generation of viruses than there was to believe in the spontaneous generation of bacteria in the time of Pasteur. The epidemiology of the virus diseases resembles that of other obligatory parasites. A few of them are transmitted by direct contact, a large group by droplet infection and many by the bites of insects The susceptibility of different organs to viruses varies, thus they rarely affect the gastro-intestinal tract

Biological variation of the filtrable viruses can be accomplished by a wide variety of experimental methods and is put to practical use in the development of vaccines for active immunisation. There is still room for research on the extent to which such variation is related to the genesis and behaviour of epidemics and to the question of supposedly new virus diseases Adaptation of a virus to different cells and to a different host gives essentially a different disease. Infections which are latent in one host may produce highly virulent and fatal disease in another As in the case of psittacosis, the virus of an established animal disease may give rise to accidental sporadic infections in man, and what appears to be a new disease in man may be a well-recognised infection in other hosts Most viruses have a preferred host, but they invade foreign hosts more commonly than is realised and when this happens they often do strange things

Epidemiology made great progress with the development of the doctrine of latent infection. In virus diseases we have wide variations in clinical effect depending on the host, and we have atypical infections merging into subclinical or latent infections Below the level of subclinical disease we also have levels of severity of infection. For some diseases prolonged and permanent latency has been demonstrated. Latent infection is nature's method for the control of contagious disease, a condition in which there is low fatality and permanent immunity. By this means nature assures the survival of both host and parasite, for nature has no favourites Probably 80 per cent. of infections with poliomyelitis are latent or subclinical infections. The importance of the carrier in virus diseases remains to be determined by adequate field studies We know that in virus diseases solid immunity follows many infections. One explanation of this is that permanent immunity is the result of latency Another possibility is that immunity is maintained by repeated exposure to infection Intracellular parasitism favours a lifelong latency.

In the control of the virus diseases little is to be expected from isolation and quarantine. Much more hopeful are specific methods of immunisation such as have been applied in smallpox, rabies and yellow fever. Progress may also come through the study of host-susceptibility. The method of blockage developed for poliomyelitis has been disappointing in practical results but represents a useful idea

Professor Gordon thinks there is every reason to be optimistic about the chances of controlling the virus diseases, and the successes of the past ten years encourage him to believe that we are in the first stages of an epoch which bids fair to rival the era of bacteriology of the past fifty years

SCOTLAND

(FROM OUR OWN CORRESPONDENT)

EMERGENCY HOSPITALS IN SCOTLAND

Last week Mr John Colville, Secretary of State for Scotland, opened the first new hospital hut annexe in Scotland in the grounds of the Astley Ainslie Institution, Edinburgh Twelve days before the hut was declared open the ground had been a vegetable garden. Mr Colville said that this was the first of 3 such annexes to be built on the institution grounds, and the first of 170 to be built in various parts of Scotland These would provide 7000 beds for use in time of national emergency, but it was hoped that a big proportion would also serve peace time needs Another 3000 beds would be provided in five completely new hospitals, each having 600 beds and capable of being expanded, if necessary, to 1200 beds The plans were being standardised and hutted annexes would soon be completed in rapid succession throughout the country Each ward unit would have the sanitary and other accommodations necessary for hospital purposes. Other units would be built to accommodate twin operating-theatres, X-ray and other equipment. Some would have preferred the buildings to be more permanent but this was an emergency job and required speed in completion and something had therefore to be sacrificed In addition, about 20 existing hospitals were being adapted to the functions they were to serve in the emergency scheme. This adaptation included the provision of new theatres, X-ray rooms and the extension of kitchens. Private individuals were also coöperating Many large houses in Scotland had been offered and 100 of them had been so far earmarked for the hospital scheme About 15,000 women were needed for emergency nursing training So far about 5000 had volunteered Of these Edinburgh had contributed 700, Glasgow 900, Aberdeen between 300 and 400, and Dundee 350 Other parts of Scotland generally show less satisfactory figures.

IMPROVED CONDITIONS FOR NURSES

The Department of Health for Scotland is urging local authorities to make nursing a more attractive profession. The difficulty of providing a separate

room for each nurse in older hospitals may be solved by allowing trained nurses to live out, adequate lodging allowances being paid. Probationer nurses ought to live in nurses' homes but these should be detached from the hospitals and run more as hostels. Nursing staffs should be relieved of domestic duties which could be performed by ward maids or orderlies so as to remove the reproach that probationers are used as cheap domestic labour. Old-fashioned restrictions should be relaxed. Holiday time tables should be constructed in advance so that nurses may have proper notice of their off duty and vacation periods. Probationers should have three weeks holiday and trained nurses four weeks each year. The monotony of food for nurses in many hospitals could be improved by better service of meals, a choice of dishes and a trained cook. The care of the nurses' health is of great importance. Routine medical examinations should take place periodically during training and on appointment to the trained nursing staff, and every nurse confined to bed or absent from duty for more than 24 hours should be examined by a medical officer.

PUBLIC HEALTH

Health Indices

ONE of the functions of national institutes of hygiene is, in the opinion of the Health Organisation of the League of Nations, to stimulate and coördinate local health activity. For this purpose they should gather data indicating the nature of local hygienic and social problems and the extent to which they are being tackled. They should also be able to compare their findings with similar information gathered in other countries. Out of General conferences of directors of institutes and schools of hygiene has grown a scheme for collecting data of this kind, culminating in the appointment last October of a committee on health indices. This committee has now drawn up a skeleton standard form of report suitable for both local and central use in each country (*Bull. Hlth. Org. L.o.N.* 1939, 8, 60 (Extract No. 2)). It is subdivided into three main parts concerned with (1) vitality and health, (2) environment, and (3) public health activity. In part 1 demographic statistics and accounts of the usual kind are required—i.e. population figures, reproduction data and morbidity and mortality rates, both general and specific as to age, sex and some causes. Environmental indices (part 2) are classified under two main headings, external and social, the former are concerned with meteorological, housing, sanitary and dietetic conditions, the latter with occupational, industrial, agricultural and educational facilities and practices and with public utilities of various kinds. In the third part an attempt is made to stereotype indices measuring the provision through governmental, voluntary and private channels for the public health and social service—i.e., personnel and equipment, medicosocial activity and social welfare (insurance, pensions and public assistance).

The plan is on the whole well designed. If the information asked for is sometimes somewhat sketchy, the drafters had in mind no doubt, the limited capacity of small administrative units, especially in rural areas, to furnish more informative particulars. (Presumably, where rates only are mentioned, it is intended to be understood that the actual numbers on which these rates are calculated will be welcome additional information.) Repetition of statistics not readily available each year such as census data, is not expected but reference should be given to any previous report in which they have appeared.

In judging the value of this scheme in relation to our own system its origin should be remembered. It seems to be intended mainly as a guide for those countries in which institutes of hygiene are closely linked with government departments and exercise large functions for them (*Lancet*, 1938, 2, 1244). In this country most of the information is contained in the central reports of the Ministry of Health and the chief medical officer of the Ministry and the Board of Education (in the preparation of which the staff of the London School of Hygiene have a part), and locally in the annual reports of medical officers of health and school medical officers. The arrangement of the subject-matter is different because the origins, administration and finance of the several parts of our health service govern the form in which particulars are given. Some of the national and local data are published only in the *Annual Statistical Review* of the Registrar General and are not readily available for local study until long after the report of the medical officer of health is in print. Localisation of some of the information—as regards factory inspection for example—would serve little purpose under the existing central administration of this service, and such figures as the rates of sickness among insured persons are not locally ascertainable in a scheme worked through approved societies.

It seems unlikely, therefore, that our own practice will be much affected by these proposals, but they deserve careful examination by central and local departments which issue annual reports. Each year the Ministry of Health and the Board of Education call for prescribed information to be furnished by medical officers of health and school medical officers. There is now much greater uniformity in the form of local reports than there used to be, but they could be improved in this respect, for purposes of extract and comparison, without destroying the local effect of individuality in their terms of expression.

INFECTIOUS DISEASE

IN ENGLAND AND WALES DURING THE WEEK ENDED JULY 29, 1939

Notifications.—The following cases of infectious disease were notified during the week: Smallpox, 0; scarlet fever, 1816; diphtheria 893; enteric fever, 19 (5.2 "expected"); pneumonia (primary or influenzal), 415; puerperal pyrexia, 105; cerebrospinal fever, 25; acute poliomyelitis 23; acute polioencephalitis 2; encephalitis lethargica, 4; dysentery, 65; ophthalmia neonatorum 106. No case of cholera, plague or typhus fever was notified during the week.

The number of cases in the Infectious Hospitals of the London County Council on Aug. 4 was 2741, which included scarlet fever 715, diphtheria 501, enteric 19, measles, 14, whooping-cough 664, puerperal fever 1 mother (plus 1 baby), encephalitis lethargica, 30, poliomyelitis, 13. At St. Margaret's Hospital there were 19 babies (plus 8 mothers) with ophthalmia neonatorum.

Deaths.—In 126 great towns, including London, there was no death from smallpox, 1 (0) from enteric fever, 1 (0) from measles, 1 (1) from scarlet fever, 0 (0) from whooping-cough, 20 (0) from diphtheria, 71 (9) from diarrhœa and enteritis under two years, and 12 (0) from influenza. The figures in parentheses are those for London itself.

Southampton had the only typhoid death. Birmingham reported 2 deaths from whooping-cough, fatal cases of diphtheria were scattered over 18 great towns. Wallasey reporting 2 and Plymouth 2.

The number of stillbirths notified during the week was 277 (corresponding to a rate of 40 per 1000 total births), including 42 in London.

GRAINS AND SCRUPLES

Under this heading appear week by week the unfettered thoughts of doctors in various occupations. Each contributor is responsible for the section for a month; his name can be seen later in the half-yearly index

FROM DOCTOR DON

II

THE attempt to unite on one occasion an industrial congress, a scientific association and a wakes' week seems foredoomed to failure and B.M.A. meetings in the past have often deserved the criticisms which Cronin has so generously and so cleverly meted out to them in "The Citadel." The various travelling clubs such as the surgeons and the medical pilgrims, which are small enough to receive and return private hospitality, probably represent the maximum size of a unit which can properly combine business with pleasure, while societies such as the Pathological Society and the Association of Physicians, with a turn-up between 150 and 200, are near the limits for effective scientific meeting and discussion There is much work in medical sociology which requires the machinery of delegates and representative meetings, and is not out of keeping with the pomp of civic hospitality, academic robes and press reports, and this seems to me the proper future of B M A. meetings.

Bournemouth probably saw the peak of lavishness on the entertainment side and at subsequent meetings a brake has been put on the tendency to mass junketing. No class in our society can stand the temptation of something for nothing or behave decorously when the individual is merged in a group. For this reason my blood—which is admittedly a volatile fluid—always boils when members of the set amongst whom I move refer to "the people" as if they were beings of a different order, suggesting, for example, that conscription is a good thing because it will instil some discipline into "the people" I remember that it was a crowd of doctors and their wives who stormed Blenheim Palace in 1936 without tickets in the worst White City tradition, and that it was a party of Hellenic Cruisers, composed of old public-school boys and university graduates, who carried out one of the biggest examples of litter-leaving of recent years in an ancient Greek theatre. The best thing that can be said about conscription is that it is a measure of democratic education, and that it may do something to redress the wrong that Arnold of Rugby and his disciples committed when they made a certain type of education a social cachet and a badge of parental good fortune But the rise and fall of public-school education is a King Charles' head which I must keep out at all cost.

* * *

To return to Aberdeen after these unflattering references to the medical profession and B M A. meetings, the scientific sections were better attended than on any previous occasion when I have been present, and the combined meeting on the sulphonamide group of drugs was the best set discussion I have ever heard Rarely can speakers have divided up the field of discussion more carefully beforehand or have said so much of interest to both the expert and the average listener. My chief memories of Aberdeen, however, will remain of fish and comic postcards. A tour through the Chicago stockyards gives many visitors a temporary revulsion from carnivorism, but fish, being quite cold and quiet, seems made to be eaten. It is the perfect subject for still life and the Aberdeen fish market affords as great an æsthetic pleasure as any show of fruit and flowers and vegetables

Every other shop in Aberdeen sells comic postcards, and I, who have a passion for this genre, could spend many a happy hour window-shopping there Apart from a few lamentable deviations into the *Bystander Tatler* technique, they retain the primitive vigour in colour and line which links them with the work of the pavement artist and the inn-sign Most of the subjects are the same crude old topics as the Canterbury Pilgrims jested on, but they are dressed up new for our time, and the short-sighted elderly lady is seen walking down the steps of a gentlemen's lavatory in mistake for an A R P shelter.

What a difference there is between the funny postcards and the filthy picture, all the gulf between the guffaw and the snicker; I am sure it is distaste rather than compulsion which prevents the circulation of the latter. There is here at hand a wealth of material neglected by our psychologists who can theorise so much from Greek mythology, Inca legends and Barrie's "Mary Rose." I had begun to believe that drawing and scribbling in lavatories were a lost art but am now sure that this is the result of the replacement of whitewash by the glossy tile, and not of change in human trends. The symbol of the New York Fair should satisfy us on that point, and a visit a few months ago to a public lavatory on the main road through Gloucester revealed a surprising collection of wall poems, phallic symbols, cotional picture-writing and homosexual invocations *This sexual wall decoration is not a class phenomenon*, and there is a room in the hostel at Guy's which can rival anything in Gloucester or West Africa I imagine it has a special age-incidence during the period of early strong and unsatisfied sexual desire, and I should be interested to know to what extent it is observed in lavatories restricted to women My own impression is that it is a fairly conscious manifestation of the worship of Priapus and in this regard it is an interesting fact that doodling, which is a private and semiconscious occupation, is extremely free from sexual symbolism. Now that so many of our young people are being herded in camps and barracks it would be easy to obtain valuable material for a thesis by a little expenditure on paint and whitewash. An analysis of the classical barrack-room ditties might be made at the same time, noting for example the close parallels between I Love My Girl and the *Song of Solomon* At present it is easier for an educated Englishwoman to familiarise herself with the sexual stories and games of the Polynesian islanders than those of her own race

* * *

I return home after six days to find waiting for me, in addition to much correspondence, one *B M J*, one *Lancet*, one *J A M A*, one *Proceedings of the Staff Meetings of the Mayo Clinic*, one *Proceedings of the Royal Society of Medicine*, an American group of reprints, a refugee's reprints with a request for a report, a request in relation to the Spanish war, agenda of two committee meetings, and finally a request for an autographed photograph from an

American who is "collecting medical prints and photographs of eminent physicians" If the Americans are beginning to collect photographs in addition to reprints life is going to be hard indeed I wonder whether he will "swop," as we did with cigarette cards, and offer 10 Doctor Dons for one President of the Royal College of Physicians

In the same post-bag is the demand for the annual report of my department and it seems inevitable that its work will chiefly be judged by the list of published papers at the end of that report My pride is that we are gradually building up a team, training nursing staff and technicians and accumulating useful apparatus, rather than that we have produced some hundrum papers, for I believe with Trotter that productive research is often a happy accident There is much to be said for producing a fertile soil so that the rare idea of promise can prosper, rather than farming for cash crops Seventy five per cent of the papers on any popular subject such as sulphonamide or vitamin C ought never to have been published and some of them might not have been but for this tradition of annual reports So one has to steer a way between writing too much or too little, giving up the literature altogether or reading oneself silly

The difficulty in all this is to find time for productive thinking, or, to put it another way, the easy thing is to go for many days without thinking I am not much impressed by the value of regular hours of work and play, as they can become a soul satisfying routine, and the satisfied soul rarely thinks I usually think only in three circumstances—when I am getting up in the morning, when I am on a reasonably long train journey, and when I have a cold A celluloid slate in the bathroom allows me to say with Matthew Arnold, "Quick thy tablets, memory," for it is fatal to imagine that these fruits of the fresh morning brain will survive breakfast and the hurry of beginning work and dictating letters In the railway train the stimulus to thought appears to be the complete isolation from visitors and telephone, combined with a passing scene which distracts but does not disturb Osler advised going to bed with a cold once a month, to get a little thinking done, and I am perforce laid aside by the common cold for one to three days at least twice a year When I read of our empire builders who stagger across leech infested swamps with malaria and temperatures of 104° F I feel ashamed of succumbing so easily to a simple febrile catarrh, but I am sure my absence reduces the sum total of personal and communal disability, and a convalescent day in bed with the dregs of the fever about one is a grand stimulus to the intellectual processes By thinking, of course, I mean something quite different from being at rest or lying fallow—actual hard, architectonic thinking about particular problems

> Tasks in hours of insight willed
> May be in hours of gloom fulfilled,

and I am a great believer in writing down plans and looking them up at intervals to see what progress has been made and what deviations have been allowed to take place All this may sound old fashioned and pious but professional people in general take on too much, work too hard, and think too little Architects, doctors, consultant engineers, all are as bad Those of us who have had to build know how badly architects and engineers work in consequence, and I cannot believe doctors are immune From the same lack of leisure to think governments lose their enthusiasm and purpose, and become increasingly tired, until a general election forces them out into the wilderness to frame a new programme In the professions we unfortunately have no general elections, and in clinical medicine and surgery people do not move about nearly enough, but remain treading the old familiar round and substituting local patriotism for new enthusiasms

* * *

Another accumulation awaiting me on my return from Aberdeen was a pile of notes, for, like Stephen Leacock's old doctor, I am accustomed to read through my patients' notes when they leave hospital and wonder what was the matter with them Some times it would have been wiser to perform this judicial summing up while they were in the ward and one wishes they could be called back. I then fill in the diagnosis from Logie's Standard Classified Nomenclature of Disease This is based on the ingenious idea that every disease has an anatomical location and a pathological nature and can therefore be expressed by two numbers Happily then the tyro turns up mitral stenosis, only to find that this is not a disease but a manifestation, and must be expressed as *Rheumatic valvulitis inactive with deformity of mitral valve*, 454 196 6 It took me quite a long time to learn how to have a normal pregnancy by Logie, and it seems quite impossible under this system to suffer from either halitosis or dyschezia The supporting tissues and fascia do not appear to be recognised as anatomical structures subject to disease and I find it difficult to give my patients a number when they suffer from pleurodynia, panniculitis, periarticular arthritis or spondylitis ankylopoietica Anorexia nervosa, the title which has graced so many essays, is replaced by *conversion hysteria + manifestation* 002–x10 (613) One can also manifest *truancy* 04x or an *urge to utter words* 908, but I am still trying to discover how to commit suicide

Now it is easy to gag any system such as this and the wise man will avoid getting mixed up in the standardisation of diagnoses, diets or clinical procedures, as all are subjects which lend themselves to endless discussion Logie's system is flexible and you can do anything with it, and as more and more hospitals in the States and in this country are taking it up it seems to me essential that there should be annual meetings at which difficulties are discussed and revisions made The American Medical Association, which now publishes Logie, will be very unwise if it attempts to handle this question off its own bat The second edition of Logie changed many numbers quite arbitrarily and made it necessary to revise diagnoses Moreover the council on chemistry and pharmacy of the American Medical Association has acted with peculiar infelicity in the nomenclature of drugs Inspired by the extraordinary dogma that the name should contain no suggestion of the action of a drug, it has quite impudently changed the names given to substances by their inventors and backed its decision by a virtual ban on the market Hence the glee with which some of us have seen the defeat of Theelin and Cevitamic Acid All this is very unfortunate, as the council on chemistry and pharmacy is in general a body of extreme efficiency and courage and we badly want its fellow in this country

It is curious that plastic people like the Americans can be so ridden by dogma In 1925 they all adhered to the Shaffer ratio according to which the body burned 1—or should it be 2 ? at any rate it must be a whole number—of fatty acid molecules for every molecule of glucose Diets based on this ratio lent

current formulæ by which the diet of diabetics was composed an appearance of mathematical precision, but this was spurious, for the actual ratio was unproved, and the introduction of the more natural diets which insulin enables us to use was retarded Nowadays the van Slyke clearance test is popular, according to which, at some quite arbitrary point, the kidney begins to take the square root of its function

But to return to my point, there would be immense advantages in a uniform Anglo-Saxon nomenclature of diagnoses and remedies The Royal College of Physicians, which has published a long outworn handbook of nomenclature, and which is scanning the horizon for new tasks to occupy it when the Conjoint Examination has gone the way of all bad old things, might well take up this question of nomenclature and secure the formation of a permanent English committee. This would meet or correspond with the American committee at regular intervals and ensure agreement in a field where there is constant growth and change.

LETTERS TO THE EDITOR

THE PROBLEM OF MEDICAL LITERATURE

SIR,—I have a threefold excuse for venturing to contribute to the discussion in your columns on medical literature First, I have some practical experience of abstracting; secondly, I disagree with many of the views expressed in your leading article; and thirdly, of course, this is the silly season. You seem to argue that we must make available in this country a copy of every medical journal published anywhere in the world and you criticise the Index Medicus for not noting all papers that are printed. I would suggest that there is a better case for reducing the number of journals taken by our libraries and for persuading the abstracting journals to limit (and not extend) the scope of their activities.

I can illustrate my point by referring to the well-known case of Ruritania Ruritania produces some 50 medical journals containing annually 3000 articles. These journals serve many local Ruritanian purposes very well; they report interesting news items, they protect the material interests of the profession, they enable interchange of views to take place and they provide summaries of advances in knowledge made in other parts of the world. Unfortunately Ruritania is a poor country; its research institutes are few, small and badly equipped, and the amount of original work produced is scanty This country's language is only understood by perhaps one British scientist in a thousand. What are we to do with the Ruritanian journals? Are our libraries to buy them, bind them and fill their stacks with them when we know perfectly well that nobody will read them, and (if the truth were told) when they are hardly worth reading? Are indexing and abstracting journals published in English and intended for the English-reading world to bother with them? It might be argued that if the Ruritanian literature were summarily ignored, a certain number of original contributions of value would be lost There is, however, no real danger of this happening. The Ruritanian fully appreciates that he is in a weak position from the standpoint of world publicity and takes appropriate and effective steps to bring himself to the notice of his colleagues elsewhere If he has an exciting discovery to report (and often when he has not) he publishes it in an English, French or German journal, or in one of the international journals A high proportion of the articles appearing in the German journals originate from non-German-speaking countries. The Ruritanian will often publish the same paper with minor emendations or additions simultaneously or successively in half a dozen journals; he will lecture on the subject abroad and so be reported again; he will write reviews or open discussions at conferences on the same theme; he will contribute to monographs, textbooks and encyclopædias; in short, sooner or later, he will impress his views on even the least attentive colleague If the Ruritanians are nationally minded, they will publish a group of journals of the Acta class in English, French and German; all serious work will automatically gravitate there and thus the world will be informed of Ruritania's contribution to medical science Surely only such Acta deserve attention from libraries or abstracting services. Holland, Japan, China, the Scandinavian countries and Russia in some measure follow this practice, so why not Ruritania The Japanese also produce abstracts of all papers published in the vernacular and (I believe) present them to the principal libraries, Ruritania might do likewise

There still remains the problem of what to do with the journals published in the half-dozen principal languages We know that many of these journals publish no original matter at all, or very little and that of the slightest value In a country like Germany where medical publications are almost the monopoly of one firm, where editorial supervision has always been notoriously inadequate and where stress has always been placed on bulk rather than quality, more and more journals are becoming wholly or largely valueless as sources of significant original material. I believe myself that the situation needs drastic action A group of committees of experts should be set up to report on the journals in each specialty; if a journal failed to reach a reasonable standard of merit, the libraries should cancel their subscription to it (if it is in a foreign language) and the abstracting journals should ignore its existence No investigator of standing would then send any contributions to the condemned journal as he would naturally want his work to be put on permanent record The same weapon could be used to control new journals. If a new journal appeared with a competent editorial board and an approved policy it might receive temporary recognition and be abstracted; if it published a high proportion of rubbish, recognition should be withdrawn until it mended its ways If my proposals were adopted the financial burdens both of the libraries and the abstracting journals would be reduced.

I do however agree with you that we need a competent medical abstracting service in the English language. It is preposterous that a library should have to pay £150 a year for an abstracting service in German; first the cost is monstrously high and secondly many of our research workers cannot readily use a service in a foreign language It would not need very large funds to establish "English Medical Abstracts," if a sufficient number of men were available to carry out the organising and editorial work in an honorary capacity during the first two or three years. Section AIII of British Chemical Ab-

Physiological Abstracts, which covers the whole field of medical science with the exception of purely clinical papers, published 14,000 abstracts last year, I doubt if the papers left out would be as numerous AIII receives a subsidy of less than £2000 from the scientific bodies sponsoring it It costs only £3 5s per annum (the cost of the German equivalent which publishes the same number of abstracts is about £30) and copies are presented for nothing or for a nominal sum to the members of certain associated learned societies An annual subsidy of say £3000 for three years should put Medical Abstracts successfully on its scientific and financial feet

As a practical proposal, I suggest that the Royal College of Physicians should take the lead and set up a committee to consider the problem The committee might consist of representatives of the Royal Colleges, the Royal Societyof Medicine, certain of the learned societies, the Medical Research Council and the Bureau of Chemical and Physiological Abstracts A workman like scheme ought to emerge from their deliberations in a comparatively short time

I am, Sir, yours faithfully,

SAMSON WRIGHT

Department of Physiology Middlesex Hospital Medical School W 1 Aug 6

SIR,—With reference to the leading article in your issue of Aug 5 the problem of how to keep abreast of published information faces workers in other branches of science in Great Britain It is interesting to see how they attempt to solve it For the sciences touching agriculture there is in this country a chain of Imperial Agricultural Bureaux, which act as information centres, and publish abstract journals covering practically all scientific information on agriculture For chemistry there exists a Bureau of Chemical Abstracts which publishes the *British Chemical Abstracts* running to some 2500 large quarto pages in each year and noticing over 25,000 papers The Imperial Agricultural Bureaux are jointly financed and controlled by the governments of the British Empire and are given facilities for their work by the well known research stations with which they are closely associated The Bureau of Chemical Abstracts is closely associated with the Chemical Society and the Society of Chemical Industry, and the journals acquired by these two great societies are put first at its disposal for abstracting

If one may judge from these experiences, it should be possible, given the willing coöperation of the great medical societies, to provide a satisfactory abstracting service for medical literature at a not too prohibitive cost to subscribers In those fields in which the need for abstracting services has been met by British effort, the cost to subscribers of the abstract journals is much lower than that of their German equivalents For example the cost to a subscriber of the eleven British abstract journals covering the science of agriculture is about £17 a year compared with some £160 for the eleven German abstract journals dealing with clinical medicine, and in the medical field the British *Tropical Diseases Bulletin*, for which there is no German equivalent, and the *Bulletin of Hygiene* each costs only £1 1s a year compared with about £12 a year charged for the German *Zentralblatt für die gesamte Hygiene*

I am Sir yours faithfully,

R. L. SUTHERLAND,
Secretary Bureau of Hygiene and Tropical Diseases

Keppel Street W C 1 Aug 7

INSULIN RESISTANCE

SIR,—I regret that absence from London has delayed my reply to Professor De Wesselow and Dr Griffiths writing in your issue of July 29 The term 'insulin resistance" is, as they say, ill defined, being used to include both cases in which enormous doses of insulin appear to be without clinical effect and also cases showing only a relative resistance to insulin Until we possess more knowledge it would seem advisable to use a different term for either group of cases It was for this reason that in my original paper on insulin insensitive diabetics (*Lancet*, 1936, 1, 127) I suggested that the term insulin resistant should continue to be used for, but be confined to, those rare cases in which large doses of insulin appeared clinically ineffective, reserving the term insulin insensitive for those common cases of diabetes in which the impairment of insulin action can only be detected by special tests Unfortunately the advantage of such a distinction was not then appreciated

De Wesselow and Griffiths state that using the insulin glucose test they have found every gradation from insulin sensitive to "insulin resistant" responses It is necessary to make clear, however, that their results were not obtained by using the original insulin-glucose test but by a modification of this test which they introduced The insulin glucose test, as I described it originally, requires ten blood samples; their modification makes use of only three As the insulin glucose curve tends to be irregularly S shaped I cannot accept their opinion that "two samples taken half and one hour after administration of glucose and insulin obviously suffice to determine the general direction of the curve " It is possible to find the preliminary, the half- and the one hour samples all of approximately the same blood sugar content Under such circumstances the insulin-glucose curve might have ranged from shapes showing marked sensitivity to insulin to shapes showing moderate insulin insensitivity Using the original insulin glucose test with ten samples Kerr and I (*Clin Sci* in press) obtained data showing the existence of two clearly demarcated types of response From these same data, but taking into account only the three samples required by the De Wesselow-Griffiths test, we recalculated the results but now we could find no significant differentiation into two types We concluded that, save in extreme cases the De Wesselow-Griffiths test fails to distinguish between the two types of response, and that this failure is due to infrequent blood sampling

I am sorry Professor De Wesselow and Dr Griffiths consider I have misinterpreted Dr Griffiths in crediting him with having 'found a difference in the peripheral insulin effect in the two types of sufficient magnitude to afford support for this contention' (that the essential difference between the two types of response lies in a difference in the peripheral action of insulin) I can find no statement in my paper which taken alone or in conjunction with its context, carries this suggestion The only reference to this work of Dr Griffiths reads "Griffiths finds the peripheral effect of insulin reduced in all diabetics but more so in insensitive than in sensitive cases This is a statement of Griffiths's published results (*Clin Sci* 1939 3, 91) not an interpretation

Finally, Sir, may I draw your readers attention to an error in fig 7 of my paper which had escaped my notice The time figures should read 0, 10 30 50 min, not 0 10 20, 30 min —I am Sir, yours faithfully,

H P HAYWORTH

University College Hospital Medical School Aug 5

PHYSICAL METHODS IN RHEUMATIC DISEASE

SIR,—I have read with interest the report by Sir Leonard Hill and Mr. H J. Taylor, Ph.D., issued to the medical profession by the Empire Rheumatism Council and published on p. 351 of your last issue. As a practitioner of physical medicine may I be permitted to indicate inexactitudes it contains? To my mind it is regrettable that such a report should be circulated as authoritative.

It states that the addition of a small quantity of titanium to the tungsten arc does not make any difference to the ultraviolet output of that arc. Many of us use the titanium-alloy arc in preference to other sources of ultraviolet (which sources we have discarded) because of the increased energy output not only in the ultraviolet but in the visible and infrared region of the spectrum. The spectrograms of Mr. Judd Lewis, D.Sc, clearly demonstrate the marked difference between the titanium-alloy and tungsten arcs. In addition we have noted improved and enhanced results since we adopted this method of treatment Has Sir Leonard Hill ever treated a series of cases by means of the titanium-alloy arc or carried out a series of control tests, or is he relying entirely on his spectrograph, which obviously produces an entirely different spectrogram from that of the well-known authority, Dr. Judd Lewis?

Again the report says that "low-energy high-frequency apparatus does not heat; therefore it has no effect other than that due to suggestion, although claims are made to the contrary by salesmen of various apparatus." This "low-intensity treatment," as it is named, has been found by numerous medical observers to have most beneficial effects in vasospastic conditions, migraine, &c. Dr. Weissenberg, of Vienna, quotes many thousands of cases which have received benefit from low-intensity treatment. Dr. W. J. Turrell, of Oxford, and Dr. P. P. Dalton, of St Bartholomew's Hospital, have recorded excellent results in the *British Journal of Physical Medicine*. Personally I have "tried out" this treatment for three months and am astounded at the results. May I mention one case?

Male, aged 35, suffering from severe migraine of nine years' duration. He had on an average three incapacitating attacks per week and had tried many forms of treatment. He had been in the habit of taking three doses per day of a strong sedative, but I induced him to forgo all drugs at the commencement of his treatment. I began his treatment some ten weeks ago and he has received in all fourteen treatments of low intensity applied to both temporal regions and general ultraviolet irradiation from the titanium-alloy arc He has now ceased treatment since he has only had one threatened attack, which did not develop, in the last ten weeks. He has also gained in weight.

Another similar case has reacted as favourably. It is ridiculous to attribute such results to suggestion. It is only clinical results which in the end can lead one to appraise the value or not of any form of treatment.

I am, Sir, yours faithfully,

W. ANNANDALE TROUP.

Wimpole Street, W 1, Aug 8

THE LAY ADMINISTRATOR

SIR,—As a lay administrator I desire to enter a protest—a very mild one of course!—against the unseemly references to lay administrators in Grains and Scruples of July 29. A Woman Public-health Officer by her own statement shows that the clerk in question "whose whole idea was to keep down travelling expenses" was upheld by the local authority because, as she states, one man was sacked for protesting. The first essential for an officer of a local authority (be he professional or lay) to understand is that he or she is just a cogwheel in the machinery of government. Officers cannot do as they like but have to do as they are told. If Woman Public-health Officer finds control irksome she should seek an occupation where her independent spirit (a thing much to be admired) can have full play and she would not need to beware of the Jabberwock who, after all, is only doing the things he is ordered to do by his employers—namely, the local authority.

I am, Sir, yours faithfully,

A. A GIBB,
Hon General Secretary, Association of Public Health Chief Clerks

Aug. 2.

NURSES IN MADRAS

SIR,—On p. 235 of your issue of July 22 Miss Hartley, secretary of the Trained Nurses' Association of India, is reported as having said, at the Imperial Social Hygiene Congress, that the government of Madras had recently, without warning, made drastic changes in the conditions of service of nurses in Madras, cut down their scales of pay, stopped their special food allowances and introduced male nurses exclusively for male patients. As a result, she added, the best type of individual was no longer available for recruitment

I have followed the question with some interest Full details have been published from time to time during this year and last in the daily newspapers of Madras. It is unfortunate that Miss Hartley's statement is not fully borne out by the facts There was, in the first place, ample warning of the proposed changes by the minister of public health in a public speech. There were then many protests, with the result that the special food allowances were restored and other minor concessions made over the first government order

It is too early yet to judge the effect of the order on recruitment. It must at the moment rest with the men on the spot to say whether there has been a deterioration in the type of nurses who have applied for training after the changes were announced

Male nurses seem to be a recognised institution over here, but they were certainly unknown in Madras not long ago If I remember right, the secretary of the Trained Nurses' Association of India herself admitted in one of her communications to the press that male nurses had a place in nursing As I understood the government order, it does not altogether deny female nurses for male patients

I have deliberately avoided any expression of opinion on the new conditions of service As a public servant of the government of Madras I am precluded from discussing my employer's actions

I am, Sir, yours faithfully,

AN ANONYMOUS MADRASI

London, Aug. 7.

MORAL REARMAMENT

SIR,—The moral rearmament campaign is receiving a surfeit of publicity at the moment in the press both general and professional, and especially by way of the British Medical Association. I recently attended a county meeting of the association at which little else was discussed Your issue of Aug. 5 reports the proceedings of a reception held in Aberdeen together with a manifesto signed by many illustrious members of our profession. Surely there is no need to incorporate these ideas in propaganda for the so-called "Oxford" group, when they are precepts which should all automatically include in our work as teachings under our Hippocratic oath

I am, Sir, yours faithfully,

THINKER

Aug 7.

PARLIAMENTARY INTELLIGENCE

ON THE FLOOR OF THE HOUSE

By Medicus, M P

Parliament has adjourned until Oct 3 and will not be recalled before that time unless the Government consider it necessary The decision to take such a long holiday in these times was not well received in the House It is true that the recess is about a month shorter than usual, but most members feel that the times are so far out of the ordinary that a meeting much earlier would have been desirable Members of all parties, Conservative, Labour, and Liberal, said it loud and said it clear, indeed some, like the old gentleman in "Alice in Wonderland," went and shouted in his ear, but they were unable to budge Mr Chamberlain Mr Churchill shook his head "in sorrow" at the Prime Minister's attitude, and the leaders of the Labour and Liberal Oppositions expressed themselves as aghast at the decision

It has been a week of high emotional potential at Westminster, and on Friday, the last day's sitting, even Mr Chamberlain confessed that his "blood boiled" at the story of the outrages on British subjects in China This boiling said what Mr Lloyd George and Mr Churchill might otherwise have said, and so both of them, although present—in a very thin House—and prepared to speak, did not do so What the House would have liked to know was whether Mr Chamberlain would boil over into action or simmer down into appeasement

Monday's debate on foreign policy, Wednesday's debate on the length of the recess, and Friday's debate on the Far East were all of particular significance The debate on the length of the recess was in fact a debate on contrasting views of the function of Parliament, and the sentiment in favour of stressing the value of Parliament, in face of the threat to democracy by the dictatorships, and therefore calling it as early as Aug 21 or 22, was so strong that Mr. Chamberlain had to make the issue one of confidence in himself in order to get the vote for which he asked

* * *

Behind the week's emotion a great deal of routine and some emergency discussion was carried through in the council-of-state mood that has become the common denominator of parliamentary discussion in recent months On Tuesday civil defence was discussed, with practically no party division, and yet gravely and adequately considered Mr Chuter Ede, Dr Haden Guest and Mr Tom Johnston from the Labour side asked questions of, and were answered by, Sir John Anderson, Lord Privy Seal, and Mr Walter Elliot, Minister of Health, on the Conservative side All agreed that the civil defence plans would work if war came, differences were only of degree. Answering Dr Haden Guest, Mr Walter Elliot gave some helpful information for hospitals needing to spend money on defence and not knowing how to get authorisation Mr Elliot said this was stated in paragraph 1 of the No 1 memorandum on Emergency Medical Services and added that any hospital should make application to his department "forthwith" The financial terms of such arrangements with hospitals had already been agreed, every penny of expenditure in excess of £1 per bed will be carried by the Government Another medical announcement of interest is that A R P Handbook of Instruction (Stretcher Parties) will shortly be published, this is urgently required, for it is the basis of the instruction given at the A R P school in Cromwell Road Whether the book has been modified since its distillation into a page proof or not was not stated, but a clash of opinion between doctors was hinted at

With regard to evacuation of civilians from towns or especially vulnerable areas arrangements for women and children of the priority classes were complete, but for the possible "second wave" of evacuation of refugees from bombed areas some arrangements had been made, but were not yet ready for publication

* * *

There have been one or two questions this week of special medical interest A rumour had arisen that blood from donors was being taken and stored in bulk for an emergency, but the Minister of Health said that this was not being done Blood donors were being registered but would not be asked to give blood unless in time of war Blood taken from individuals would be stored separately and not mixed

The answer to a question on the patent medicine stamp duties went almost unperceived in the week of political emotions, but the reply was noteworthy, as it stated that an inquiry is to be undertaken, under the joint auspices of the Chancellor of the Exchequer and the Minister of Health, into the questions involved This inquiry will range over the whole field from taxation qua taxation to control of the sale—and perhaps manufacture—of patent medicines

Sir Reginald Dorman Smith, Minister of Agriculture, announced, in answer to a question, that the Milk Marketing Board has submitted a scheme for supply of milk at reduced prices to expectant and nursing mothers and that it will come into effect as from July 31 Later in the week the scheme was "laid on the table" which means that it can be looked at in the library of the House

* * *

The attention drawn to the pro Nazi activities of "The Link" organisation by the Home Secretary, Sir Samuel Hoare, was paralleled by a "written" answer to a question given by Mr Peake on behalf of the Home Office According to this answer various organisations including "the Nordic League" are being kept under close observation So Parliament when it reassembles may find itself discussing "What is a Nordic race?" What the mother of Parliaments would make of this discussion would certainly be interesting It would probably refer it to a commission of Lords and Commons to examine it as the claims of osteopathy were examined—and with probably the same result

FROM THE PRESS GALLERY

Civil Defence Medical Services

In the House of Commons on Aug 1 Mr Dobbie raised the question of hospital services in connexion with civil defence He urged that those in charge of the municipal hospitals had a bigger administrative experience of the kind of problem that war would bring and that the organisation of the hospitals should be more on the basis of the municipal than of the voluntary regime

Mr Simmonds said that he had received a number of strong representations from doctors who would be called upon to work in the first-aid posts and hospitals in war-time in which they expressed dismay at the lack of protection to be provided for this work. We were far behind Paris in this matter where there were 30 underground hospitals with a good deal of protection He also urged that some thing better than

splinter-proof protection should be provided for the operating-theatres of the great metropolitan hospitals.

Dr. HADEN GUEST said he wished that it were true that every doctor knew exactly what he had to do in case of emergency, but this was not so and the same applied to the hospitals. He hoped that the Government would inform them where the authority lay in the hospital sectors so that they could authorise payments for absolutely necessary expenses quickly. The success of the casualty-collecting organisation would largely depend on the preliminary training of the first-aid and stretcher parties The details of training recommended should be made quite clear either by the speedy issue of an official handbook or otherwise. Preparations should also be made to take into the country areas the second wave of evacuation with which he was sure they would have to deal.

Mr. ELLIOT, Minister of Health, replying, said that the 100,000 hospital beds on which they were counting for the first wave of air-raid casualties were ready now. They would be provided when an emergency arose by sending home the patients fit to go. The second 100,000 beds for the second wave of casualties were being placed in existing institutions by what was called "crowding." Of these additional beds 50,000 were already in the hospitals, and the second 50,000 would be there by the end of this month. By the end of September in England and Wales they hoped to have huts completed with 1760 beds; by the end of October with 7160; by the end of November with 29,500; and by the end of the year with 35,000 beds—that was, if they could keep up to schedule. As regarded nurses, the position roughly was that they had 9000 or 10,000 trained nurses enrolled and some 45,000 auxiliary nurses enrolled for training. Mr. Ede had suggested that hospital organisation rested too much in the hands of the voluntary hospitals and too little in those of the municipal hospitals, which obviously provided the larger measure of accommodation. That was so, but first of all the heads of the great teaching hospitals had a tremendous position of authority and technical pre-eminence in the profession. It was quite wrong to underestimate the prestige which they gave The administrative problem was simplified by the fact that the deans of the great teaching hospitals were not themselves in administrative units and therefore should find it easy to cooperate with the various authorities concerned. The difficulty of putting the London County Council over all the other units should not be underestimated, particularly when it came to the adjoining counties. He hoped that the experiment they had tried of drawing the executive officers from the voluntary hospitals, rather than from any of the single administrative units, would be a success It was working out that way. His representatives said that nothing could exceed the helpfulness, comradeship and desire of the local authorities, both elected representatives and technical staffs, to cooperate in this admittedly novel scheme. As regarded protection for hospitals, and particularly their operating-theatres, Memorandum No. 1 of the Emergency Medical Services stated that the authorities responsible for institutions in an area likely to be attacked should consider what protective measures were required and should then, if it was considered that the case was one for Government assistance, submit their proposals to the appropriate department, together with an estimate of the expenditure involved The Stretcher Parties Handbook of Instruction, A.R P. No 10, had been held up owing to certain professional differences, but those differences had now been composed and they would get the book out as quickly as possible It was not merely a case of actual delay but a clash of opinion with doctors, and that was always difficult to resolve.

Sir FRANCIS FREMANTLE said that the distribution of the medical services had been greatly delayed owing to the difficulty of arriving at the precise terms and conditions of service. Those had been settled within the last few weeks through an emergency committee working under the auspices of the British Medical Association and the Ministry of Health. This was a vital matter, because those who were concerned with medical work wanted to know which doctors were going to be available, where they were to come from and so on. There should be no delay now that the terms and conditions had been settled. He hoped that throughout the country the committees would now actively begin to distribute the services of the medical practitioners and consultants in their different units, so that they might get to know their stations.

Old-age Pensions

On July 27 in the House of Commons a vote of censure was moved on behalf of the Labour Opposition by Mr. ARTHUR GREENWOOD regretting

"the refusal of His Majesty's Government to provide the necessary ways and means for the improvement and extension of old-age pensions"

He said that whilst the minds of most people were weighted down by anxiety because of the unsettlement in the international situation, to a large number the risk of war was remote but day-to-day expenditure on the bare necessities of life was a constantly worrying problem The need for pensions had now been recognised by all political parties, and there was a growing recognition that there should be a good deal more generous treatment of old people. Hundreds of thousands of them were trying to eke out a decent livelihood on £1 a week. On the previous day Sir John Orr had said that old people needed 7*s* per head per week as a minimum for food alone Assuming no other resources that left 3*s*, 4*s*., or 5*s* a week to meet all the other needs of life—clothing, house-accommodation, light, repairs and fuel It was impossible to meet all these requirements out of the difference between 7*s*. and 10*s*. The result was that these people did not spend enough money on food. The Prime Minister had taken comfort in the fact that only 10 per cent of the pensioners sought public assistance. That in itself was a sad admission of the inadequacy of our pension scheme, but it did not disclose the whole truth. It ignored those who were too proud to ask for help and who starved in silence, and the considerable number—in some areas amounting to half the total of old-age pensioners—who received help from relatives which the relatives themselves often enough could not afford. The Labour Party's proposal was that the normal old-age pension should be 20*s*. a week for one person and 35*s*. for a married couple. This should be regarded as a retirement pension at 65, payable on the understanding that these people left wage-earning employment. They also proposed that where people were 60 or over, and were out of work with little prospect of getting another job, the retirement pension should also be available to them. The proposal for an inquiry was an admission that there was something that was not right, unless it was a dodge.

Mr. CHAMBERLAIN, the Prime Minister, said that when the original Pensions Act was passed in 1908 the estimated annual cost to the Exchequer was £8,750,000. In 1925, before the Contributory Pensions Act was passed, it had risen to £46,000,000 and the estimates for the current year showed a charge for these pensions of over £69,000,000. These increases were partly due to the fact that two generations ago there was a great rise in the number of births and partly to the increased expectation of life, which in itself was a result and a justification of the increased expenditure on the public-health services. What was going to be the result of this increased expectation of life, coupled with the diminution in the birth-rate which was going on at the same time? In 1931 the number of persons of 65 years and over was in proportion to the number between 15 and 65 years of age—the earning ages—as 11 to 100. In 1955 the proportion would have risen to 16 to 100, and by 1975 to 21 to 100. Surely they ought to consider the effect on the next generation of anything

that might be done today As time went on an increasing proportion of the population would be eligible for pensions and a decreasing proportion would be earning wages and therefore be able to pay for the pensions Pensions were not the only one of our social services which had been making an ever growing demand on the Exchequer Taking the last fifteen years the cost to the Exchequer of housing had grown from £9,000,000 to £18,500,000 per annum, education from £15,500,000 to £58,000,000, and unemployment insurance and assistance from £13,750,000 to £71,500,000 The total cost to the Exchequer of old age pensions, contributory pensions, housing, health insurance, unemployment insurance and assistance, education and physical training and recreation had risen in the past fifteen years from £102,800,000 to over £224,000,000, and that took no account of the block grant, in which there was a considerable element of social service During this period they had also had to find interest on the war debt, which at the highest reached £300,000,000 in a year and at the lowest £224,000,000 After giving details of the heavy cost of rearmament Mr Chamberlain said that if the Labour Party were in office they would see much more clearly the impossibility of undertaking schemes which would impose major additions to the burdens on the country What he had said in his letter to Mr Graham White was that the Government could not accept any scheme

"which would involve such additional demands on the national exchequer as would imperil that financial stability on which depend the well being of industry and employment and the maintenance of all the existing services"

The answer to the question whether anything could be done without bringing on them the danger to which he alluded in this letter must depend on what additional contributions the present contributors were prepared to make Nothing could be decided without further information on that vital point They must consult employers as well as workers and must consider what was the limit of expenditure that they might reasonably ask the Exchequer to undertake The Government had decided to undertake without delay an investigation into these matters, and hoped to arrive at a decision before the end of the summer recess If the result enabled them to do anything to ameliorate the position of the widows and old-age pensioners nobody would rejoice more heartily than he would

Standards of Nutrition

On Aug 2 there was a debate on education in the House of Commons Mr J FES SMITH, on behalf of the Labour Opposition, said that he had complained for many years that the figures published by the Board of Education regarding the physical condition of children were utterly misleading The figures in the last report were excellent, 15 per cent , normal, 74 per cent , slightly subnormal, 10 per cent , bad, 0 7 per cent or only about 1 in 150 Those figures were completely contradicted by the medical profession, and especially by the medical experts who were developing the new science of nutrition Only a fortnight ago in the House of Lords Lord Dawson of Penn had said that from 22 to 25 per cent of the children of this country were not receiving the diet appropriate to their age or necessary for their proper development and seeing that this view was supported by the figures of the British Medical Association and by experts on nutrition how could the Board of Education contend that only 1 child in 150 suffered from bad nutrition and that only 10 per cent were slightly subnormal? That was a contradiction that must be explained The explanation, he thought was that the doctors who made these examinations took as their standard of what was normal the average children in the area in which they lived If they took Sir John Orr's optimum of children living under the best possible conditions such as boys at Eton, Harrow, Winchester and Charterhouse, they got 90 per cent of school children subnormal and only a few reaching normal The medical examination of the new militiamen showed that the physical condition of the young people of the country was very satisfactory but there was some danger of being too complacent about what those figures actually showed It was important that the public should not be misled The figures quoted to the public of the examination of militiamen were these grade I, 83 per cent , grade II 9 per cent That gave 92 per cent who had passed the physical test But if they looked at the instructions given to the doctors they found exactly the same phenomenon as in the case of the medical inspection of schoolchildren the doctors were told to take the normal healthy boys of that age as grade I That was not a particularly high standard In an article in the *Times* Sir Ronald Davison had said —

> These figures do not justify any complacency over the health of the nation in all its age groups Undoubtedly a great burden of subnormal health, warped bodies and downright sickness is still incurred between the ages 21 and 50 Most of this is unnecessary and due to industrial conditions, unwise habits and poverty An ample agenda of reform lies ahead and will tax all our energies

Mr Lees-Smith urged that the first reform was to take the advice of the medical profession who had examined this problem, and to ascertain the average family income below which it was impossible to bring up children under conditions of full health and strength Taking that as their standard, they should ensure by milk or by meals that all the children in the schools from those families should receive the food necessary to give them the best possible condition of vitality The effect that this would have on the physical condition of the youth of the nation in a comparatively short time was incalculable

Sir ERNEST GRAHAM-LITTLE emphasised the need for assistance by the Board of Education in the provision of educational films in the schools He did not think it was fully realised how useful films of this kind could be There was, for example, the admirable film prepared by his friend Julian Huxley on the value of foodstuffs

Mr KENNETH LINDSAY, parliamentary secretary to the Board of Education, quoted a passage from a report by the Advisory Council on Nutrition, signed by Sir John Orr, Professor Mellanby, Mrs Eleanor Barton, and others —

> We have had under review the various methods which have been tried or are in process of trial or have been suggested for the assessment of the nutritional state We are unable to recommend any known method as reliable So far as our present knowledge goes it would seem that the clinical method given in detail in Administrative Memorandum No 124 of the Board of Education is the most promising but the trial of this method has not been sufficiently prolonged to establish its reliability

Mr Lindsay also quoted another sentence from Sir Ronald Davison's article in the *Times* —

> Meanwhile these Militia statistics are definitely encouraging They do prove that something satisfactory has been happening to our child and adolescent population since the war and still more since the beginning of the century

The aim of the Board of Education, said Mr Lindsay, was to eliminate malnutrition in the schools They did not rely on this clinical assessment He could show the House what they had done in the way of surveying the position in the areas of nearly half the education authorities in the country The board also advocated six monthly nutrition surveys If there was the slightest symptom of malnutrition nurses, doctors or teachers were encouraged to advocate the immediate provision of free milk or free meals

---

In the House of Lords on Aug 4 the royal assent was given to the Public Health (Coal Mine Refuse) Act

Both Houses adjourned on Aug 4 until Oct 3

QUESTION TIME

AUG. 3–4

Nervous and Mental Disease in War-time

Mr. SORENSEN asked the Minister of Health whether, in view of the probable increase in nervous and mental breakdowns in the event of war and the need of securing adequate hospital treatment, he would reconsider the present intention of utilising certain mental hospitals for the purpose of dealing with military casualties — Mr. ELLIOT replied: The present intention is to utilise for military casualties parts of two mental hospitals only. In the war hospitals scheme full account has been taken of the probable needs of the civil population requiring treatment for nervous or mental breakdown.

Mr SORENSEN: May I take it that provision has been made for the possible increase in nervous breakdowns in war-time?—Mr ELLIOT: Yes, Sir.

Midwifery Services in Reception Areas

Sir FRANCIS FREMANTLE asked whether, in view of the difficulties of providing for the care of expectant mothers in reception areas in the event of the Government's evacuation plans being put into operation, he was satisfied that an adequate number of experienced midwives would be available.—Mr ELLIOT replied: No midwife engaged in the hospital or domiciliary practice of midwifery, whether she is a trained nurse or not, should be diverted to casualty or other non-midwifery work until the full requirements of the midwifery service in an emergency have been met. Local authorities in areas to be evacuated should make arrangements to send with expectant mothers, for work in the reception areas, a full quota of practising midwives with recent midwifery experience, and should arrange that where necessary such midwives should be obtained from all institutions and organisations in the area which, owing to the discontinuance or curtailment of their maternity work, will have midwives to spare. Similar considerations apply to midwives normally employed in the reception areas, where midwives should not be diverted to other services until the requirements of the midwifery service have been supplied.

Civil Nursing Reserve

Colonel NATHAN asked the Minister of Health the extent of the response to his appeal for an additional 100,000 hospital nurses, and the nature of the arrangements made for refresher courses for those who were trained and for training those who were not trained.—Mr ELLIOT replied: There are now some 7500 trained nurses and 2900 assistant nurses enrolled in the Civil Nursing Reserve, and approximately 45,000 women have applied for training as nursing auxiliaries In addition it is hoped that the majority of the immobile nursing members of voluntary aid detachments, some 24,000 in number, who have been released from their service obligations will enrol in the Civil Nursing Reserve, 6500 having already applied for enrolment The arrangements for training untrained auxiliaries are in the hands of the county and county borough medical officers of health with their local emergency committees, the scheme of training having been laid down by the Central Emergency Committee for the nursing profession with my approval. The training consists of lectures in first-aid and home nursing and a period of instruction in hospital amounting, if possible, to a fortnight (or ninety-six hours taken over a longer period), although a minimum of a week (or fifty hours) is permitted Refresher courses for trained nurses are being arranged by the Royal College of Nursing and in some areas by the medical officers of health and their local emergency committees.

Blood Storage for Civil Defence

Dr. HADEN GUEST asked whether the blood taken from donors to be stored for use in emergency was stored separately or mixed in bulk, whether he was satisfied as to the condition of such storage; and whether the danger of the conveyance of disease was adequately safeguarded—Mr. ELLIOT replied: Donors of blood are being grouped and registered but will not be asked to give blood unless and until an emergency arises. The blood taken from each donor will then be stored separately and not mixed The arrangements for storage are made under the supervision of pathological experts and I am advised that there is no danger of disease being transmitted through blood that has been stored under proper conditions

Dr. HADEN GUEST. Is it a fact that blood is being stored in bulk at the present time?—Mr. ELLIOT: No, Sir.

Sir FRANCIS FREMANTLE: Are sufficient arrangements being made for the different qualities of blood which it is essential to make if the scheme is to be of any value?—Mr. ELLIOT. That point is being borne in mind

Supply of Spectacles to Military Forces

In reply to several questions Sir V WARRENDER, financial secretary to the War Office, said: The normal method is that a regular soldier's eyes should be examined by a military ophthalmologist (an officer of the R.A.M.C.), and that the glasses he prescribes should be supplied by the optical appliance department of the Ministry of Pensions About four out of five cases are covered in this way. For stations where a military ophthalmologist is not available an agreement was concluded last August with the National Ophthalmic Treatment Board under which that organisation undertakes, at reasonable fixed charges, examination by an ophthalmologist and provision of spectacles by an optician. It is the only organisation in the country which provides the double service

In the case of territorials it has been decided to issue in peace, free of charge, to every member of an air defence unit who wears glasses, a pair of spectacles specially made for wear with a gas mask. For the sake of administrative simplicity it was decided for this purpose to make use of the existing agreement with the N.O.T.B for the provision of spectacles, rather than to enter into other arrangements Many representations have been received on this subject, but it is clear that the board offers, economically and efficiently, the services which are needed, and that other bodies have not the full services to offer No useful purpose would, therefore, be served by receiving a deputation.

Scientific Research Volunteers

Replying to Mr. Pickthorn Mr. ERNEST BROWN, Minister of Labour, said that the numbers of volunteers enrolled in the main categories of the central register on July 22 included 6456 persons qualified for scientific research, 4743 persons for industrial chemistry and 4617 from the universities and teaching profession The response had, in the main, been satisfactory, but some employers in certain of the more important categories had been reluctant to allow qualified members of their staff to volunteer It was thought that this might be due to a misconception of the use to which the register would be put in war-time Machinery would then exist to determine priorities of national importance between different classes of work, and before volunteers already in employment were submitted for alternative posts the observations of their employers would be carefully considered by expert committees appointed for the purpose It was, therefore, hoped that in the national interest employers would encourage their qualified staffs to enrol on the register so that it might be equal to the calls made upon it in the event of war. It was to be remembered also that the register would be available in war-time for the use of employers as well as of government departments and that in certain circumstances they might find it of great use for securing replacements of staff As the register was intended as a pool from which to draw qualified persons in war-time, volunteers should not expect to be allocated to specific posts in advance of an emergency, although it was proving possible to do this in a comparatively small number of cases

Medicine Stamp Duties

Captain ELLISTON asked the Chancellor of the Exchequer whether he could now give any further indication of his intentions with reference to the medicine stamp duties—Sir J. SIMON replied: Yes, Sir. I have been in consultation with the Minister of Health and we propose jointly to appoint a committee to examine the whole question. I am not yet in a position to announce the precise terms of reference, but the intention is that the committee's inquiry

shall cover both the control and the taxation aspects of the question

Eye Accidents to Miners

Mr DUNN asked the Secretary for Mines whether he had given consideration to the gradual rise in the rate of eye accidents to miners in this country, which shows that between 1920 and 1937 injuries to miners' eyes had increased from 3 71 in 1920 to 5 42 in 1937 per 1000 persons employed, and what recommendations he proposed to put forward —Mr GEOFFREY LLOYD replied The following table shows the eye injury rate per thousand coal miners employed for the years 1925 to 1938 No official figures are available for earlier years

NUMBER OF PERSONS WITH EYE INJURIES FROM ACCIDENTS INVOLVING ABSENCE FROM WORK FOR MORE THAN 3 DAYS AT MINES UNDER THE COAL MINES ACT FOR THE YEARS 1925 TO 1938 (EXCLUDING 1926)

Year	No of eye injuries	No of persons employed and rate per 1000	Year	No of eye injuries	No of persons employed and rate per 1000
1925	8351	1,117,828 (7 5)	1933	5874	797,291 (7 1)
1927	7004	1,037 391 (7 6)	1934	6541	707 699 (8 2)
1928	7366	951 632 (7 7)	1935	6507	779,502 (8 3)
1929	8372	969,736 (8 6)	1936	6942	777,871 (8 9)
1930	7985	913,442 (8 5)	1937	6978	803 359 (8 7)
1931	6764	877 141 (7 7)	1938	6738	802,443 (8 4)
1932	5914	827 439 (7 1)			

It will be seen that the rate for 1937 does not correspond with that given by the hon member As regards the second part of the question, continuous efforts are being made to persuade workers whose occupation renders them specially liable to such accidents to wear protective goggles, the design of which has recently been much improved

Quota for Alien Doctors

Mr ERSKINE HILL asked the Home Secretary whether the quota for alien doctors permitted to practise in this country had been reached, and whether he could make any statement as to the attitude of his department to the serious effect of over-competition in certain branches of the profession —Mr PEAKE replied The policy of the Home Office, *settled after consultation with representa* tives of the medical profession, has been that permission should be given to a restricted number of foreign doctors who have come here as refugees to practise or take appointments in this country, but it has been recognised that the number of foreign practitioners who can properly be absorbed *in the medical profession* is limited and that a careful selection must be made The Home Secretary knows of no ground for any suggestion that the admission of refugee doctors has led to over-competition

Nutritional Survey

Mr DAVID ADAMS asked the Minister of Health (1) what progress had been made in the work of nutritional survey as described in the report of the Ministry of Health for 1937-38 and when the published results might be expected, and (2) what progress had been made in obtaining statistical data with reference to the distribution of the population according to income, and whether the results would be published in a form showing clearly the differences between distressed special areas and more prosperous areas —Mr ELLIOT replied The field work of the surveys and the statistical data to which the hon member refers have been completed After any necessary analysis they will be considered by the Advisory Committee on Nutrition, of whose inquiries they form part I am not in a position to forecast the date at which or the form in which the committee's report will be published

Milk

Sir ERNEST GRAHAM LITTLE asked the Minister of Health what approximate proportion of the liquid milk at present sold in this country might be regarded as safe and unsafe, respectively so far as disease-spreading organisms were concerned, including tubercle, brucella, and other infections —Mr ELLIOT replied I am afraid that the information available does not permit of any reliable estimate being made

Sir ERNEST GRAHAM LITTLE asked which local authorities in England or Wales possessed power or took steps to ensure that milk sold within their area was pasteurised, and what action had been taken during the past three years, under the Food and Drugs Act or other legislation, to institute prosecutions in cases where tuberculous milk had been sold —Miss HORSBRUGH replied The Minister *is not aware that any local authorities have power to* enforce the pasteurisation of milk sold in their areas As regards the second part of the question, while his information is not necessarily complete, he does not know of any case of prosecution As the hon member is aware, the ordinary practice where tuberculous milk is discovered is, if possible, to trace the source of infection and to cause the infected cows to be slaughtered

Sir ERNEST GRAHAM LITTLE asked whether, in view of the medical opinion that public health was endangered by the continued sale of raw milk, he would take steps to prevent the present indiscriminate advertising of milk by the Milk Marketing Board without regard as to whether the increased quantity of milk consumed was safe or dangerous —Miss HORSBRUGH replied The Minister has no power to take steps of the kind suggested even if he thought them desirable

Sir PERCY HURD asked whether the Minister's attention had been called to the disclosure in the report of the county medical officer for Wiltshire that pasteurised milk used under the milk in schools scheme and also pasteurised milk sent wholesale to London and elsewhere had been *found to be tuberculous, and what was being done in the* matter —Mr ELLIOT replied: My attention has been called to this report by the county council I understand that investigations were made and certain pasteurising plants in the county were found to be producing milk which was inadequately pasteurised The county council informed the local authorities concerned, and the latter took the matter up In forwarding the report to me the county council recommended that the responsibility for the licensing and supervision of pasteurising plants should be transferred from the local authorities with whom it now rests to the county council This recommendation would involve an amendment of the Milk (Special Designations) Orders which would doubtless arouse con troversy but I will bear it in mind for consideration when other amendments of the orders are contemplated

Major PROCTER asked the Minister of Agriculture whether he was aware that the Milk Marketing Board had inserted in their contract a clause which prevented manufacturers of butter and cream from selling skim milk for human consumption; that as a result of this restriction *manufacturers had in some cases been forced to waste* this valuable food product, that skim milk in this was being imported in large quantities from abroad, and whether he would consider intervention in this matter — Sir REGINALD DORMAN SMITH replied The contract for the sale of milk by wholesale provides that the buyer shall not sell any separated milk except to persons previously approved by the Milk Marketing Board but that such approval shall not be unreasonably withheld As regards the second part of the question I do not know of any restrictions imposed by the Milk Marketing Board upon the sale of condensed skimmed milk or skimmed milk in its dried state, which is the form recommended for general use by the Advisory Committee on Nutrition As to the last part of the question, I have no power to intervene

Mr MACQUISTEN asked the Secretary of State for Scotland whether he was aware that for many years particularly in Scotland, prior to the intervention of the Milk Marketing Board, all classes were accustomed to drinking large quantities of fresh skim milk but that in recent years the board although charging manufacturers for supplies and permitting its sale for feeding pigs, had restricted them from selling it for human consumption with the result that large quantities of skim milk imported in cans from Holland had taken its place, and whether he would institute an inquiry into the present position — Mr COLVILLE replied The milk marketing boards in Scotland have not imposed restrictions on the sale of skim milk for human consumption

OBITUARY

CUTHBERT ROBERT KENDAL

M.R.C.S., L.S.A.

Dr C. R. Kendal, who died on July 22 at the age of 97, was the oldest surviving student of the Newcastle-on-Tyne medical school, and his death carries the mind back to the Orchard Street days when Headlam, Dennis Embleton, G. H Heath, Sir John Fife and Greenhow were honoured names among the teachers of the school As was then customary he went up to London and took the examinations from the college and hall (M R C.S. and L S A.) in 1863, so that he had been a qualified practitioner for no less than 76 years In his earliest days he was a pupil at the Gateshead dispensary, the nursery of many north-country practitioners at that time He went first into practice at Wark on the North Tyne, then a remote and delightful Northumberland village. Life for the doctor was hard, for it meant many long journeys into the hills sparsely peopled by small farmers and shepherds. Most of the journeys had to be done on horseback or afoot and going was rough in the winter. After seven years Dr. Kendal migrated to Hexham-on-Tyne, then a thriving market town often spoken of as the "Heart of all England." There he remained a well-known and highly respected practitioner, whose tall figure with the inevitable high hat was a familiar sight in the old town. But much of his practice lay in the surrounding country and rather up the valley than down Long journeys in the dog-cart were necessary, while in winter the sleigh, which he kept in his garden to the end of his days, was often in use All his life in Hexham he lived under the shadow of the ancient abbey, and as years passed on he seemed to become a link with the romance of the past. For a short time he was joined in practice by one of his daughters and then just before the war by the late Dr. Fairclough. When Fairclough died in middle life some years afterwards the old doctor who survived, still in harness, was more than twice his age.

Dr Kendal was a sound conscientious practitioner who in every emergency exhibited that gift of imperturbability which probably enabled him to enjoy his declining years and to be an example to his fellows He was interested in sport of all sorts, loved the open air with garden and flowers and was skilled as a bridge player right on into his old age His wife died in 1931, two years after their diamond wedding; he is survived by his son, Dr Hugh R Kendal, and his grandson, Dr. Hugh Yarrow Kendal, both of Westerhope, near Newcastle-on-Tyne

W. J. MAYO

Prof. J. R Learmonth writes: It is hard to realise that Dr. Will is dead. For a substantial part of his life his had been the controlling spirit in one of the greatest surgical centres in the world. Learned bodies in the United States and elsewhere delighted to honour him, and he enjoyed the admiration and respect of numberless colleagues. To few professional men comes such material success, and to fewer the combination of material success and professional esteem. Very early in his career he must have made up his mind regarding his professional ambitions; the development of the clinic which goes by his name was so logically progressive that it seemed that each stage had been planned and provided for almost from the beginning. His prescience detected the value of clinical investigation aided by the ancillary sciences, and from the earliest days of the clinic a proportion of its funds was set aside to provide for research and for postgraduate education. From this ideal he never departed; he lived to see his dream child real and so firmly established that he could withdraw from its active supervision It is quite essential that any statement of his position in the surgical hierarchy should be preceded by this emphasis on his attitude towards his work and towards his obligations as he conceived them, for with his breadth of outlook and disinterestedness he would have achieved greatness irrespective of the career he had chosen to follow.

His contributions to surgery are so classical that it is hardly necessary to enumerate them; throughout his life his chief interest was the surgery of the alimentary tract. He grew up, as it were, with gastric surgery, and his technical contributions to this subject are matched by his considered appraisal of the value of operative procedures for the relief of peptic ulceration and of carcinoma The surgery of the biliary apparatus attracted him, and from his many contributions may be selected his method of reconstructing the common bile-duct He was a pioneer in the surgery of the spleen, where he was able to benefit by the close coöperation which he had arranged between surgeon, physician and laboratory The method of repairing umbilical hernia which goes by his name has become a standard procedure He was a clear compact writer, with a gift of arrested phraseology. His major contributions are characterised by a constant endeavour to deduce general principles, and to this task he brought a vast experience, complete sincerity, and an uncommonly critical judgment As an operator he was methodical and unhurried His knowledge of anatomy and pathology made him deft in unravelling complicated problems, quick to meet emergency, and ready to modify or improvise as the need arose. When he completed an operation, one felt that it had been a piece of finished craftsmanship.

Though (like the captain of a battleship) he kept himself somewhat apart, his influence over patients was extraordinary. Many patients not under his immediate care would ask to see him, or he would discuss a clinical problem with relatives, from the least to the greatest they would accept his opinion and advice unhesitatingly, and with a completeness of trust based upon his reputation for probity and cemented by the realisation that they were in the presence of an outstanding personality His apparent aloofness was I think an inevitable consequence of his habit of taking an entirely dispassionate view of a problem One felt that it was part of a sustained effort to do what was right and fair, it was judicial rather than emotionless. Though it was never wholly discarded in private life, there are many who will remember the gracious hospitality of his home and the kindness of the lady who presided there, upon whose sympathetic understanding he had depended so much throughout their married life.

On the broader aspects of surgical policy he exerted an influence which extended beyond the United States He befriended and encouraged young men, of whom I had the honour to be one He took a leading part in the organisation of the American College of Surgeons and the American Su

Association, and was active in maintaining the high traditions of both these bodies With his brother he made munificent gifts to the University of Minnesota, which founded, and will maintain in perpetuity, the magnificent facilities for postgraduate work, both clinical and laboratory, provided by the Mayo Foundation To many good causes he gave generous financial assistance and wise advice It is perhaps too soon to make a full estimate of the part he will fill in the history of medical effort He envisaged and successfully put into operation the conception of group practice, and this effort to provide coördinated diagnosis and treatment for the sick may well come to be regarded as his supreme contribution to medicine The profession has lost a great surgeon, the sick, a tireless helper, his immediate colleagues, an inspiring leader and many of us a gentle and kind friend

Prof W McK Craig, neurological surgeon to the Mayo Clinic, writes The sad news of the death of my preceptor and friend reached me while in Aberdeen, a guest of the British Medical Association Our profession, which recognises no international boundaries, no differences of race or creed, loses a great leader, a great teacher, a great humanitarian Honours came to him and his brother because they merited recognition for the work to which they devoted their entire lives, and which achieved for them citizenship not only of Rochester and the United States but of the entire world Dr Will's greatness as a man is probably best exemplified by the devotion and loyalty which he inspired in every member of the Mayo Clinic and Mayo Foundation To us he was more than a director or chief of staff, he was a counsellor, an adviser, and a great inspiration His keen interest in our individual problems, his breadth of vision, and his great personality created an undefinable esprit de-corps which extended throughout the clinic and hospitals of Rochester He had that rare combination of professional and personal leadership which united the members of the clinic staff into one large family, and his passing means a great personal loss to those of us who were privileged to serve under him and know him

R W REID

A CORRESPONDENT writes Although it is fourteen years since Professor Reid retired from the chair of anatomy in Aberdeen University he will be sadly missed by his old students who looked forward to seeing him on their visits to Aberdeen, for no visit north seemed complete without a sight of 'Old Bobby' Considering the number of pupils who passed through his hands it was astonishing to find how intimately he recalled them and from his many kindly acts of remembrance it was easily apparent that he had followed their careers with interest He and his sister Isabella were inseparable, they had been together as he used to say, from childhood, and she was as active as he in showing hospitality to students old and new They had a very wide circle of friends and were always happy to widen that circle Miss Reid was a most delightful hostess During the war she played a very active part in running the rest-room where returning soldiers were welcomed and fed at Aberdeen station She never stinted herself but always tried to prevent her assistants from working too hard

One of Professor Reid's great achievements was the inception and cataloguing of the Anthropological Museum at Aberdeen which must always be associated with his name Although this life long hobby had its origin in anthropometry and ethnology his interests were catholic and not the least important of his collections are those of church tokens and early domestic appliances, while his interest in the pre history of Aberdeen and the Orkneys and Shetlands is evident throughout the museum

"His highly critical mind and ever youthful outlook no doubt owed much to his hobby only a couple of years ago, referring to his continued interest in the museum, he said, 'Ach well, it gives me something to *put my boots on for in the morning*' *Even at this* time no weather was too bad for him to keep an appointment with anyone at the museum, and on arriving through a blizzard which had nearly daunted us we were greeted with 'My, it was good of you to come on a day like this'—and that at 86!"

MEDICINE AND THE LAW

Lead Lying Dormant?

AT an inquest, held in Manchester on Aug 2, on a painter 55 years old, it was stated that his death had been hastened by lead poisoning that might have been lying dormant in his body for more than twenty years The man had been employed by the London Midland and Scottish railway company as a painter for thirty three years Mr Harri Heap, the Manchester city analyst, said he had examined certain organs of the dead man and found that the amount of lead in circulation was fairly large and the proportion of lead in the bones was far greater than in normal persons In the brain was 4 8 mg per kg, in the liver 6, and in the kidneys 6 The bones contained 60 mg per kg The lead which the body had not thrown out was laid down permanently in the bones, but in certain conditions of stress the lead might be released from the bones and entering the circulation set up a toxic condition Answering a juryman Mr Heap said there was no lead in the Manchester water supply, but water might be contaminated with lead from household pipes Lead could be absorbed into the body in several ways, it could, for instance, be taken when eating tinned food if the tin had a lead seal A person who ate lead had a better chance of getting rid of it because (in the scientific sense) it remained outside the circulatory system If lead were breathed into the lungs it was impossible for the body to throw it out in the usual way Far more lead poisoning was caused by breathing lead than by eating it Dr G S Smith, chief pathologist to Manchester city hospitals, stated that death was due to heart failure following bronchopneumonia and was accelerated by lead poisoning In his opinion something had occurred to mobilise the lead in the bones, the devitalised state of the body resulting from the bronchitis would be sufficient to have that effect The man had suffered recently from fading vision and faintness and these symptoms could occur as a result of lead poisoning Evidence was given by an employee of the railway company that no lead had been used in their paints for a number of years, it was stated that the man had been rubbing down wagons that had been in use for about forty years Mr Jesse Riscroft, city coroner, said the case was interesting from the scientific standpoint The jury returned a verdict of accidental death due to the man's occupation

ciety of Massage and Medical

ngress of this society will be held from the Caxton Hall, Westminster, London, ing address will be given by Dr. A. E. l speak on radiographic studies of adult lation through the heart, while Prof. l, will deliver the founders' lecture His Sest and movement in the treatment of er information may be had from the society, Tavistock House (North), , London, W.C.1.

ledicine and Post-Graduate Medical

lecture-demonstrations in neurological .S candidates will be given on Monday gs at 8 P.M. at the inpatients' department Hospital for Nervous Diseases, Regent's 28 to Sept 15 A course in physiology the F.R C S. primary examination will ys, Wednesdays and Fridays at 5.15 P M. ociety of London, 11, Chandos Street, 4 to Nov. 24 Courses in preparation examination will be given as follows : t the Brompton Hospital (Tuesdays and P.M , Aug. 29 to Sept. 20) ; in chest and the Royal Chest Hospital (Mondays, Fridays, 8 P M., Sept. 4 to 22) ; a ological class in the outpatient depart- y's Hospital, London (Tuesdays and , Sept. 5 to 21) ; in neurology at the ital for Nervous Diseases (afternoons, and in tuberculosis at Preston Hall, .r. to 5 P M , Saturday, Sept. 16). Other ade children's diseases at the Infants to 23) ; plastic surgery (Sept. 20 and 21) ; Gordon Hospital, London (Sept 25 ectious diseases at the Park Hospital (Sept. 23 and 24). The courses are open to all and associates of the fellowship, and further may be had from the secretary of the fellowship, 1, Street, London, W.1.

London Insurance Committee

The committee are returning to their office Insurance Street, and after Sept. 5 all should be sent to them there at Insurance Insurance Street, W.C.1.

Sanitary Inspectors' Association

The 52nd annual conference of this association will held at Bournemouth from Sept. 4 to 9 under the of Mr. J. C. Dawes. Further information may be had the secretary of the association, 19, Grosvenor London, S.W.1.

Cheap Milk for Mothers and Children

A scheme has now been completed by the Ministries of Health and Agriculture to enable all expectant and nursing mothers and children under five who cannot the milk they need at full retail prices to get a pint a day either free or for not more than twopence, according to their circumstances. It is hoped to achieve this by making milk available to local authorities for their maternity child-welfare centres at 1*s* 4*d*. a gallon—not much more than half the ordinary price Anyone wishing to receive milk under the scheme will have first to apply to the local authority ; they will then be told whether they are eligible and if so at what price. They will ask an approved dairyman to deliver at their home the milk to which they are entitled. It will not be necessary for applicants to be examined medically before they can be allowed a supply of milk, unless more than the normal supply is desirable on medical grounds.

The success of the scheme depends in the first instance on the response made by local authorities. Before any authority can launch the scheme in its area it must submit its proposals to the Minister of Health Local authorities should therefore take this step as soon as possible, before the milk gets lost in a maze of white papers.

Births, Marriages and Deaths

BIRTHS

DAY —On Aug 8, 1939, at the Lindo Wing, St Mary's Hospital, W.2, to Ruth, wife of Francis Montagu Day, deputy medical officer of health, metropolitan borough of Hammersmith—a son

MAGEE —On Aug 4, in London, the wife of Dr C Gaulter Magee—a daughter.

MYERS —On July 14, at Wellington, New Zealand, the wife of Mr. Geoffrey Myers, F R C S —a daughter

PASSMORE.—On Aug 5, at Coonor, S India, the wife of Dr. Reginald Passmore—a son

REES.—On Aug. 3, at Cardiff, the wife of Dr. E J. Rees—a son

TANNER —On Aug 4, at Newton Abbot, the wife of Dr. Guy Tanner—a daughter.

THOMPSON —On July 31, at Spilsby, Lincolnshire, the wife of Dr Harold Thompson—a son

WALSH —On July 30, the wife of Dr. Robert Walsh, of Osterley, Middlesex—a son

MARRIAGES

BRAINE—JAMES —On July 24, at All Saints Church, Taiping, Perak, Federated Malay States, George Ian Hector Braine, M B , to Marjorie Haughton James, M.B

COLEMAN—YOUNG —On Aug 3, Mark Coleman, M S , F R.C.S., to Margaret Winifred Young

STEVENS—COCKERTON —On Aug 1, at Seaton Parish Church, Alfred Edward Stevens, M.D , of Little Mead, Jersey, C.I., to Barbara Mary Cockerton.

SWAYNE—BLENKIN —On Aug 5, at St Albans Abbey, Denys Harald Swayne, B.M., to Katherine Margaret Blenkin, M.B.

DEATHS

GOBLE —On Aug. 3, Edwin Wallace Goble, M R C S , of Grove Lodge, Winchmore Hill, London.

ROMER.—On Aug 7, Frank Romer, M.R C.S

TAYLOR —On July 31, at The Vale, London, N W 11, Birdwood van Someren Taylor, M B Edin , C.M.S medical missionary for 50 years at Fukien, S China, aged 84

WRAGG —On Aug 4, at Southend-on-Sea, Ernest Wragg, M.B Camb

N.B —A fee of 7s 6d. is charged for the announcement of Births, Marriages, and Deaths

Appointments

BLYTH, WILLIAM, M.D. Glasg., F.R.F.P.S.G., D.P.M., medical superintendent at the Ayrcliffe Colony for Mental Defectives, near Darlington.

DAVIES, H. S., M.B. Lond., D.P.H., medical officer for Newton-le-Willows and Golborne.

FARR, JOHN, M.D. Manc., F.R.C.S.E., resident surgical officer at the Guest Hospital, Dudley.

GRAY, J. A., M.D. Edin., D.P.H., deputy medical officer of health for Barrow in Furness.

HARDMAN, JAMES, M.B. Birm., F.R.C.S., hon. neurosurgeon to the Royal Sheffield Infirmary and Hospital.

MCLENNAN, W. A., M.B. Glasg., D.P.H., medical officer of health for Dudley.

MCNEIL, A. S. B., M.B. Edin., assistant resident medical officer at the Royal National Hospital for Consumption, Ventnor.

SPRINGFORD, W. E., M.B. Lond., resident surgical officer at the Chesterfield and North Derbyshire Royal Hospital.

STOREHAM, G. R., M.B., N.Z., M.R.C.O.G., obstetric officer for Barrow in Furness and Lancashire.

VICKERS, H. R., M.B. Sheff., M.R.C.P., hon. second dermatologist to the Royal Sheffield Infirmary and Hospital.

WILLIAMS, E., M.B. Lond., resident medical officer at the Glan-Ely Hospital, near Cardiff.

London County Council's Mental Health Services—The following promotions are announced:—

CALDWELL, W. A., M.R.C.P., D.P.M., medical superintendent at West Park Hospital.

MURRAY, J. R., M.D. Lond., D.P.M., deputy medical superintendent at Banstead Hospital.

SANDS, D. E., M.R.C.P., D.P.M., first assistant medical officer at Bexley Hospital; and

WATTERSON, D. J., M.B. Camb., D.P.M., second assistant medical officer at Long Grove Hospital.

Manchester Royal Infirmary—The following appointments are announced:—

REID, R. G., M.B. Ipsol., F.F.R., D.M.R.E., radiologist.

NICHOLSON, W. A. B., M.B. Manc., F.R.C.S., resident surgical officer.

SMITH, REGINALD, F.R.C.S.E., D.L.O., first assistant surgical officer (aural).

LAWSON, H. P., F.R.C.S.I., L.D.S.R.C.S., D.L.O., second assistant surgical officer (aural).

JELLY, G. O., F.R.C.S., chief assistant to surgical unit; and

HOWAT, H. T., M.B. St. And., M.R.C.P., medical chief assistant.

Vacancies

For further information refer to the advertisement columns

Accrington Victoria Hosp.—H.S., £175.

Argyll, Argyll and Bute District Mental Hosp.—J.A.M.O., £350.

Barrow-in-Furness County Borough—Asst. M.O.H., £500.

Bath and Wessex Children's Hosp.—H.S. at rate of £120.

Bedford County Hosp.—Third H.S. at rate of £150.

Birmingham Children's Hosp.—Res. surg. O., £175. Also asst. res. M.O. and asst. pathologist, £125.

Birmingham and Midland Hosp. for Women—H.S., at rate of £100.

Birmingham University—Lecturer in physiological dept., £400.

Bradford, Municipal General Hosp.—H.P.s and H.S.s each at rate of £150.

British Postgraduate Medical School, Ducane Road, W.12—Asst. at rate of £1.0.

Bury County Borough—Deputy M.O.H., £750.

Cardiff, King Edward VII Welsh National Memorial Assn.—Area asst. tuber. officers each £500. Also two asst. res. M.O.'s for Sully Hosp., each £200.

Central London Ophthalmic Hosp., Judd Street, W.C.1—Sen. and jun. H.S.'s £200 and £150 respectively.

Chesterfield and North Derbyshire Royal Hosp.—H.S. and asst. res. O., at rate of £150.

Colchester Royal Eastern Counties Institution &c.—Med. supt. for Bridge Home, Witham, £750.

Colonial Medical Service—Two health officers, each £700.

Devon County Council—Asst. county M.O.H. and district M.O.H., £800.

Dorking County Hosp.—Res. asst. M.O. at rate of £270.

Durham County and Sunderland Eye Infirmary—H.S., £350.

Durham County Council and Seaham Urban District Council—Asst. school M.O. and M.O.H., £800.

East Ham Memorial Hosp., Shrewsbury Road, E.7—H.P. at rate of £150.

Elizabeth Garrett Anderson Hosp., Euston Road, N.W.1—Clin. assistantships in gynæcological outpatient dept.

Gloucester, Gloucestershire Royal Infirmary—H.S. to ear, nose, throat and skin dept. at rate of £1.0.

Greenwich Metropolitan Borough—Asst. M.O., £500.

Hosp. for Tropical Diseases, Gordon Street, W.C.1—Two R.P.s each at rate of £120.

Hounslow Hosp., Middlesex—Hon. physician for physiotherapeutic dept.

Huddersfield Royal Infirmary—H.S. to abnormal maternity dept. at rate of £150.

Hull Trinity Road Institution—Asst. M.O. £3.0.

Hull Royal Infirmary—Second H.S. at rate of £150.

Ilford Borough—Asst. dental surg. on £150.

Infants' Hosp., Vincent Square, Westminster, S.W.1—H.P., at rate of £100.

Kingston County Hosp., Surrey—Res. asst. M.O. (anæsthetist) at rate of £250.

Lancaster, Royal Albert Institution for the Feeble Minded—Res. jun. M.O., £125.

Leeds, Killingbeck Sanatorium—Asst. res. M.O. £250.

Leicester Royal Infirmary—Resident appointments.

Liverpool County Mental Hosp., Rainhill—Asst. M.O., locum tenens, 8 guineas a week.

Liverpool Royal Babies' Hosp., Woolton—Res. M.O., at rate of £125.

Liverpool City—Pathologist, £750.

London County Council—Asst. M.O.s Class I and II., £350 and £250 respectively.

London Hosp., E.1—Sen. res. O. £100. Also clin. asst. in X-ray dept., £35.

London University—Chair of chemistry at Royal Cancer Hosp., £1000.

Luton Borough—Pathologist and bacteriologist, £650.

Manchester, Christie Hosp. and Holt Radium Institute—Asst. M.O., £100.

Manchester, Crumpsall Hosp.—Res. asst. M.O., at rate of £200.

Manchester, Duchess of York Hosp. for Babies—Jun. res. M.O., at rate of £75.

Manchester, Park Hosp., Davyhulme—Res. obstet. officer £100.

Manchester City—Res. anæsthetists for Crumpsall and Withington Hosps., each at rate of £250.

Manchester Royal Infirmary—Two jun. asst. M.O.'s in radiological dept., each £350. Also res. M.O., £200.

Mexborough Montagu Hosp.—Res. surg. O. £100.

Miller General Hosp., Greenwich Road, S.E.10—H.P. and H.S., each at rate of £100.

New Zealand, Wellington Hosp. Board—Orthopædic registrar £500.

National Temperance Hosp., Hampstead Road, N.W.1—Cas. O., at rate of £120.

Newcastle-upon-Tyne, Royal Victoria Infirmary—Hon. asst. P.

Northumberland County Council—County M.O.H. and school M.O., £1200.

Nottingham Children's Hosp.—Res. H.P., at rate of £150.

Nottingham City Mental Hosp.—Jun. asst. M.O., £475 or £350.

Oldham Royal Infirmary—Sen. H.S., at rate of £250. H.S. to eye and ear nose and throat depts. and H.P., at rate of £175. Also two H.S.'s, each at rate of £175.

Oxford Radcliffe Infirmary—Res. surg. O. at rate of £150. Also H.P.'s and H.S.s, each at rate of £100.

Pembroke County War Memorial Hosp., Haverfordwest—Res. H.S., £200.

Plymouth, Prince of Wales's Hosps.—H.S. at rate of £150. H.P., H.S., and res. anæsthetist and H.S. to spec. depts., each at rate of £120.

Prescot, Whiston County Hosp.—Res. surg. O. and sen. res. M.O., each £100.

Preston, County Mental Hosp., Whittingham—Deputy med. supt., £800.

Prince of Wales's General Hosp., N.15—Res. jun. H.P. and H.S.'s, each at rate of £90.

Queen Charlotte's Maternity Hosp., Marylebone Road, N.W.1—Res. anæsthetist at rate of £100. Res. anæsthetist and dist. res. M.O., at rate of £90. Also asst. res. M.O. at rate of £80.

Queen's Hosp. for Children, Hackney Road, E.2—Physician for whooping-cough clinic 1 guinea per attendance.

Redhill, East Surrey Hosp., Surrey—Res. asst. M.O. at rate of £250.

Rochdale Infirmary and Dispensary—Second H.S. £150.

Royal Eye Hosp., St. George's Circus, S.E.1—Sen. H.S. and two asst. H.S.s, at rate of £150 and £100 respectively.

Royal London Ophthalmic Hosp., City Road, E.C.1—Sen. res. O., at rate of £150.

Royal Naval Medical Service—Medical officers.

Salford City—Asst. clin. tuber. officer £.0.

Salisbury General Infirmary—H.S., at rate of £125.

Samaritan Free Hosp. for Women, Marylebone Road, N.W.1—H.S., at rate of £100.

South Shields County Borough—Asst. M.O. (tuberculosis), £400.

Southampton Free Eye Hosp.—Hon. asst. ophth. surgeon.

Swansea County Borough—Asst. M.O., £500.

Tredegar, Aneurin and General Hosp.—H.S., at rate of £125.

Walsall and General Hosp.—H.S.O., £300.

Warwick, King Edward VII Memorial Sanatorium, Hertford Hill—Jun. asst. M.O., at rate of £250.

Weir Hosp., Weir Road, Balham, S.W.12—Jun. res. M.O. £150.

West London Hosp., Hammersmith, W.6—Genito-urinary surgeon.

West Riding of Yorkshire County Council—Asst. bacteriologist £650.

Western Municipal (Fever) Hosp., Neasden, N.W.10—Res. M.O., £2.0.

Woolwich and District Hosp. Assn., Shooters Hill, S.E.18—H.S. and cas. O. at rate of £100.

York County Hosp.—H.P., £150.

A MARINE HOSPITAL.—Sir Alexander Mackenzie has given £100,000 to the Lord Mayor Treloar Cripples Hospital to extend its seaside branch at Hayling Island. The money will be used to build a new hospital facing the sea, which will accommodate 120 patients. It will be specially equipped for the aftercare of cases of infantile paralysis. There will be pools for underwater gymnastics to which patients will be brought on electric trolleys, then will be lowered into the pools by special hydraulic cranes. The present small hospital will continue in use for infectious patients. The new hospital will at first take only children up to 16 years, but patients from any hospital in the British Empire will be eligible for admission.

NOTES, COMMENTS, AND ABSTRACTS

THE CONVICT AS A WORKING MAN

THE governor of Parkhurst Prison made a revolutionary suggestion at Oxford last Monday in an address to the summer school of the Howard League for Penal Reform. Discussing the habitual criminal, he proposed that every prisoner should be given a fully stamped insurance card on his release to enable him to receive unemployment benefit. If the country desired a man to live a normal life outside prison, he should not be made to live an abnormal life inside the prison walls. The governor outlined a scheme for the men sent for the first time to penal servitude. They should go to a training prison and learn to work machines for producing clothing and boots for the Government A man sent back for another sentence would go to a factory prison and be paid at trade-union rates on condition that he became a member of a trade-union The Government, being one of the largest buyers of clothing and boots, would take the whole output of the factory prison

With the economics of the plan and with the potential disturbance of private enterprise the economists will doubtless deal. If it sounds expensive to maintain the discharged convict on the dole, the cost of keeping a man in prison is not cheap The main object is the cure of antisocial habits For this purpose the modern treatment of the prisoner makes the smallest possible distinction between persons in prison and persons elsewhere The prisons have their libraries, their pictures on the walls, their cinematograph films and their wireless sets. In all the nine Borstal institutions, in all the four convict prisons and in several local prisons the system of paying wages is established It was introduced experimentally at Wakefield in 1929, was endorsed by the departmental committee on Employment of Prisoners in the 1933 report, was successfully tried with the "star class" convicts at Maidstone in 1935 and was adopted in 1937 in the Portsmouth preventive detention prison, at Dartmoor and at Parkhurst The prison commissioners have described the effect as remarkable Reports for miscellaneous offences have almost entirely disappeared The doctor's parade has dwindled almost to nothing. Even among the mentally and physically subnormal recidivists at Parkhurst there is a general air of interest and liveliness which no-one can remember before.

In the past a prisoner usually avoided the skilled trades in gaol and preferred something simpler Now he wants to work in the skilled trades in gaol because the pay is higher And the earnings begin at once on admission, the man being able to buy tobacco or other luxuries or comforts as soon as he has begun his sentence In the past he had to make a slow progress through various grades and could not smoke for the first four years of his incarceration Modern prison policy, concentrating upon rehabilitation, treats him more and more as a normal human being in the hope that he will so conduct himself after his discharge He is now a wage-earner in prison. The next step, a prison governor tells us, is a trade-union rate of wages, trade-union membership and unemployment benefit

ONE PIECE OR TWO?

WE have received the following note from "ex-sister":—

"As a nurse who trained in a London hospital 30 years ago, and with a daughter accepted for training in the same hospital, may I suggest that while so many improvements have been seen in these years, no change has been made in the uniform. Working in the Rockefeller Institute of Peking, side by side with nurses from the States, one could not but be convinced of the superiority of the drill-coat dress over the many pieced uniform of our nurses. In the event of a crisis, time must be saved and laundry work reduced to a minimum. A change of uniform for nurses could be introduced gradually with each new batch of probationers entering the hospital, sisters and staff nurses retaining the older type of dress, which would gradually disappear."

A voluntary-hospital matron, whose opinion we have asked, tells us that one of the obstructions to any modernisation of uniform has been the attitude of the nurses themselves. On one occasion, when nurses were demonstrating patterns to a hospital committee, members of the committee asked the nurses for their opinions, and all four said they preferred the existing uniform. Practical considerations demand two garments, a frock and an apron. After sanitary rounds, nurses must be able to change the top garment easily for meals. Belts, collars and cuffs could be abolished but the effect is to produce a nurse-maid kind of dress. Against any radical changes, it must be remembered that a probationer without experience depends on her uniform to inspire confidence in the patients, and there is no doubt that the existing uniform does this by adding a year or so to the eighteen-year-old. The uniform represents authority and helps the nurse around many tight corners.

A YEAR OF SANITATION

THE report of the sixth Public Health Services Congress and Exhibition[1] held last year contains a wealth of perhaps rather undigested material. No less than 472 local authorities sent 932 delegates, and 19 associations cooperated by organising meetings. Among the papers of special interest is J Wilson's on housing in the special areas of Scotland. The Scottish Special Areas housing association were arranging to build 3000 houses of poured concrete and 2000 of timber. Air-Commodore I. M. Bonham-Carter and Colonel A. J. C. Bird discuss air-raid precautions and water supply. It is comforting to learn that the ordinary filter beds of a reservoir will deal adequately with mustard gas and lewisite For the rest, the subjects range from river pollution to nursery schools and from gas-fired crematoria to cooking pans for potato crisps.

MEDICAL DIRECTORY, 1940.—This mine of information is once again in course of production and should any of our readers have failed to fill in their schedules they should do so at once. Fresh forms for those who have changed their addresses or mislaid the originals may be obtained from Messrs. J. and A Churchill, 104, Gloucester Place, London, W.1.

Dr. E. P. POULTON points out that in his paper in our issue of Aug 5 the acknowledgment on p. 309 should be to Miss E M. Hickmans, Ph.D.

RETIREMENT OF MR. C. G ANDREWS.—Mr. C G Andrews, chief clerk of the Conjoint Board, has retired on pension He has been in the service of the board for forty-seven years, first on the Embankment and, since 1912, in Queen Square. For thirty-five years Mr. Andrews has personally informed every candidate of the result of his or her examination in surgery, both for the F.R C S and M.R C S, as well as for the L.D S It is estimated that his smiling "I am glad to tell you that you have passed" has been welcomed by some twenty-three thousand doctors, while his sympathetic "I am sorry to say that you have failed" has softened the blow for many more thousands, for Mr. Andrews was nothing if not sincere.

ADDRESSES AND ORIGINAL ARTICLES

VISCERAL NEUROSES

By JOHN A RYLE, M D Lond, F R C P.
REGIUS PROFESSOR OF PHYSIC IN THE UNIVERSITY OF CAMBRIDGE, CONSULTING PHYSICIAN TO GUY'S HOSPITAL, LONDON

III*

Cardiac Neuroses

THE relationship between emotion and cardiovascular phenomena is too well known to require emphasis Tachycardia, fainting, over consciousness of the heart, a throbbing neck, even pain in the precordial and sternal zones may all be caused by nervous influence alone

Cardiac neurosis may manifest itself by disturbances of rate, rhythm, or sensation, or by any combination of these Common enough in civilian practice it is far more common under conditions of military stress, and it is probable that many more cases of "soldier's heart" in the Great War were due to emotional causes than to the various physical and infective factors which were blamed at the time Nervous tachycardia, extra systoles, the so called "effort syndrome," simple paroxysmal tachycardia, and the cardiac component of vasovagal attacks (Gowers's syndrome) may all be reasonably included within the category of the cardiac neuroses I shall here consider the two last named only These peculiar disorders, both intermittent and paroxysmal in a manner which characterises so many of the visceral neuroses, have scarcely as yet received the recognition due to their vivid and interesting symptomatology, to the degree of ill health and anxiety which they may impose, and to the physical and psychological characteristics of those who suffer from them

SIMPLE PAROXYSMAL TACHYCARDIA

The accounts of paroxysmal tachycardia given in the textbooks are for the most part descriptive of the attack only, of the sensations to which it may give rise, the pulse rate, the heart sounds, the abrupt onset and termination of attacks, and the cardiographic findings The differentiation from paroxysmal auricular fibrillation (which in the absence of organic disease, thyrotoxicosis, or other manifest physical cause should also, perhaps, be accepted as a neurosis) and from the graver and more sustained paroxysms of flutter is duly and properly considered But even so the picture is incomplete It is as though one were to describe the asthmatic attack without describing the asthmatic patient, his antecedents, his attendant disturbances of health, and the factors in his life or environment which may be shown by long experience to be inimical Reading my case notes of patients with simple paroxysmal tachycardia I discover not only the usual points of interest attaching to individual cases but also a composite narrative and illustration which the textbooks seem to miss Once again the necessity of studying the whole man and not merely his organ or his attack finds confirmation Here are sample cases

CASE 29.—A young man had been afflicted with a stammer from the age of 3 He had had erythema nodosum in childhood At school he frequently fainted in chapel He came on account of attacks of paroxysmal palpitation and volunteered that he had felt much better from the moment when the appointment was made (How frequently we hear this comment in cases of neurosis, and how significant it is of the underlying anxiety and its present relief by a transference of decision and responsibility) Three years previously he had first been troubled by slight attacks of tachycardia but was at first able to stop them by taking a deep breath He had been excessively busy and considerably worried He was a heavy smoker, consuming up to thirty cigarettes a day His recent attacks had all started with feelings of heat and sweating, he then had an urgent call to stool and passed a bulky formed motion, then the tachycardia followed, and he quite often vomited The tachycardia would generally last an hour or so, but on one occasion it had persisted for twenty-four hours Although in a recent attack a medical man had counted the pulse-rate at 120 only, an observation which might have thrown doubt on the diagnosis, the patient himself, who was experienced in pulse-taking, described it in other attacks as "as much as he could count"

Here a mere description of the cardiac attack would have omitted much essential background and conveyed no indication of the much more general "explosion" manifest in the sweating and gastro intestinal symptoms, or of aetiological factors and the modifications of habit likely to lessen the frequency of the attacks

The three cases which follow illustrate the association of paroxysmal tachycardia with other nervous and visceral disturbance

CASE 30.—A retired merchant, aged 69, had had bouts of typical paroxysmal tachycardia since school *days, coming at first at long intervals but in recent* years more frequently Lately he had developed spasmodic asthma He had fears of driving in taxi cabs, and yet if he started an attack out of doors he would at once jump into one and drive home He dated his chief deterioration in health from an occasion when a doctor who saw him during an attack remarked that he was dying The attacks would last from two minutes to five hours One had lasted seventeen hours Onset and termination were abrupt His blood-pressure readings were *185/100* There were *no other signs of disease*

CASE 31.—A man, aged 62, had spent a healthy life in youth sheep farming until the age of 21 and thereafter was in business in the city until the age of 50 One night in June, 1918, after physical exertion followed by a big dinner and much tobacco he had his first attack of paroxysmal tachycardia Thereafter, between 1918 and 1931, he had had *seventy-six attacks* The pulse rate in the attacks was about 160. They would start and usually end abruptly He continued to play golf and to lead an active life The attacks were preceded by a feeling "like a tennis ball" below his left ribs, and he associated them with his large bowel There were no signs of organic disease

CASE 32.—A medical student, aged 21, who had an extremely bad stammer, complained of attacks of paroxysmal tachycardia with pulse rates up to 180 or 190 a minute, starting and ending abruptly He remembered attacks in childhood but was then free of them for some years They reappeared occasionally when he was startled At first occurring approximately once a month they had lately become more frequent They could be arrested by lying down He recognised that attacks could be brought on by violent exercise but continued to play rugby football He had also recently developed asthma, which was commonly induced by *sneezing, coughing*, or even by a deep breath Usually the asthmatic attacks lasted a few minutes, but he had had one or two which lasted all night They were cut short by inhalations of amyl nitrite One maternal cousin was an asthmatic An example of cardiac,

* The third Croonian lecture, delivered at the Royal College of Physicians on May 25 1929 Lects I and II have appeared in previous issues of THE LANCET

respiratory, and speech "stammering" in the same individual.

In a series of 21 cases of simple paroxysmal tachycardia the ages varied from 21 to 76, with an average of 53 years. In the older cases the history of attacks often went back many years, and there was nothing to support the view that the degenerative changes of the later decades were contributory In 3 cases there was a family history of asthma, and in 1 instance the patient's daughter also had paroxysmal tachycardia. In 9 cases the following associated neuroses were recorded: asthma and stammering; asthma, stammering, and colonic dysfunction; migraine and heartburn; aerophagy or "flatulence" (3 instances) and (in 1 of them) vertigo; colonic dysfunction; dysmenorrhœa. Anginal pain accompanied the attacks in 2 cases but did not occur at other times; 1 patient had angina of effort but had no pain in the attacks Anxiety and worry in a few cases, and in 1 case startling events, were mentioned as conducive to attacks When digestive disturbances were associated with them in the patient's mind, spastic colon and aerophagy seemed best to fit the symptoms described.

There are no good grounds for regarding simple paroxysmal tachycardia as an expression of cardiac disease or intoxication. The differential diagnosis is seldom difficult. Its intermittency, its persistence through long years without physical deterioration, its temperamental and other associations, and the absence of all organic signs bring it within the category of the neuroses. Although it may be associated with asthma, and although a severe tachycardia accompanies anaphylactic shock and serum-sickness, we are scarcely entitled to claim paroxysmal tachycardia as an allergic phenomenon It may express the nervous constitutional endowment with which the allergic tendency is also commonly associated, but further than this we cannot reasonably go In this respect it takes its place with the spastic colon, globus, and proctalgia When, as may happen, organic disease or hyperpiesia is superadded, or sometimes when the attacks are very prolonged, then heart-failure may ultimately follow and even death. Asthma and angioneurotic œdema, which do not cause irreversible structural change in the bronchioles or the laryngeal mucosa, are also very occasionally fatal through secondary effects

VASOVAGAL ATTACKS (GOWERS'S SYNDROME)

I have taken a particular interest in these strange and sometimes alarming seizures since first reading the description of them by Gowers in his "Borderland of Epilepsy" (Gowers 1907) some fifteen years ago. Although there are minor differences in description they are not, I think, to be separated from the angina pectoris vasomotoria of Nothnagel (1867). It is a matter for some surprise that they still so often escape recognition; that the cardiologists have not paid more attention to them; and that the psychiatrists are often content to dispose of them as "anxiety attacks"—a description which is only partly true and offers no hint of the features which distinguish them from other anxiety reactions. In general practice they are often loosely labelled "heart attacks"; this again is to be deprecated, for it tends to maintain the anxiety to which their perpetuation is in large part due To me they appear as at least as worthy of separate consideration as ordinary faints, petit mal, or vertigo. They have a characteristic symptomatology; there are objective manifestations of a striking kind at the time of the seizure; they cause intense mental misery and physical prostration; during an attack the appearance of the patient may be sufficiently alarming for relations and even medical men to suppose that the patient is dying; and at times the differentiation from the anginal seizure of coronary artery disease is by no means easy.

Lewis (1932) prefers to employ the adjective "vasovagal" in connexion with ordinary faints or syncope, objecting that the components of Gowers's syndrome have not been sufficiently studied, and that the case for vagal and vasomotor effects is not so clearly established as it is with the faint. He emphasises the subjective at the expense of the objective features in Gowers's syndrome, but the latter are at least as striking as those observed in the faint and of longer duration Gowers and Nothnagel described the facial pallor, the white and cold extremities, the subungual cyanosis, the contracted radial artery, and I have many confirmatory observations of my own.

A leading although not a visceral symptom is the sense of dying, or angor animi, a peculiarly terrifying and, as Allbutt (1915) insisted, an "organic" sensation, which is recorded occasionally also in the angina of coronary disease and in severe vertiginous seizures. Trained observers have noted it in themselves as the most disturbing symptom of too large a dose or too sudden an administration of adrenaline. It has also been noted by C P. Symonds (private communication) in cases of tumour and gumma of the medulla oblongata. Accompanying this strange sensory experience there is commonly a sense of thoracic constriction and discomfort or actual and sometimes severe pain in the sternal or precordial region with radiation into the left arm and up the left side of the neck The pain and constriction may accompany effort but are generally independent of it. Feelings of indescribable malaise, of helpless immobility, and a leaden feeling in the arms, more rarely with tingling or tetany, are also described. A sense of unreality at the onset of an attack is sometimes mentioned Coldness, even with shivering, and prostration follow the attack; the prostration may persist for many hours Very rarely there is a loss of consciousness; when this happens it is apt to last much longer than in a simple faint. The objective signs include pallor and coldness of the surface and extremities, extreme slowing or, conversely, acceleration of the pulse-rate, shallow and rapid breathing (which is probably responsible for the tetany when this occurs), and remarkable fluctuations in the blood-pressure. I have counted a pulse-rate of 44 in a woman whose husband, a doctor, had counted it as low as 30 during the height of other attacks, and in one attack, in which consciousness was lost, he made it as low as 19 a minute. In this attack she "looked like marble" Her earlier attacks were accompanied by sternal pain and were taken for true effort angina.

There are notable reminders of certain of the phenomena which accompany other paroxysmal disorders. Thus the same pallor and vasomotor changes are seen in fainting and vertigo, and again these are scarcely to be distinguished in their full development from the same manifestations in surgical or anaphylactic shock or an extremity of fear. The same prostration, often enduring for hours, follows a bad vertiginous or migrainous attack. The same pain and the same sense of constriction and immobility accompany the angina of effort. The occasional loss of consciousness reminds us of fainting and epilepsy

Vasovagal attacks almost invariably occur in persons who are simultaneously afflicted by some slight impairment of general physical fitness and by

chronic or recurring anxiety—a further example of the combined influence of several factors which would seem to underlie so many of the neuroses. Of physical factors the menopause or a low-grade infection or an anæmia are especially to be remembered. Occasionally a sudden visceral disturbance may induce an attack. Colonic irrigation repeatedly caused attacks in one of my patients; a severe cut out of sea air in another.

On the basis of the foregoing description and the specimen case-reports which follow, some violent vasomotor disturbance with accompanying vagal effects, manifested especially in the occasional bradycardia, seem to afford the best explanation of the attacks. The visceral character and distribution of the cardiac pain point to coronary spasm. The vagal phenomena—slow pulse rate and the curious powerlessness and immobility which affect the limbs, taken in connexion with the occasional appearance of angor animi in patients with organic lesions of the medulla oblongata all suggest the inclusion of the medullary level of the nervous storm. Not dissimilarly the migraine episode may mimic or suggest organic disease at a lower level by causing transitory hemiplegic symptoms. Associations both with migraine and epilepsy have been noted in patients liable to vasovagal seizures.

The close resemblance of the symptoms in some cases to those of anaphylactic shock make it tempting to bring Gowers's syndrome within the allergic category. Pallor, coldness, substernal oppression, and striking pulse rate and blood pressure fluctuations are common to the two conditions. It is thus of more than passing interest that one of my patients developed his attacks after a second course of tetanus antitoxin, and that another had had a preceding anaphylactic upset from bee stings. Migraine was an associated neurosis in eleven cases, and mucous colic, angioneurotic œdema, and spasmodic *rhinorrhœa* each in one case. These observations notwithstanding I prefer for the present to regard the syndrome as a non-specific manifestation of combined physical and emotional origin in patients of a particular constitutional type.

As with ordinary fainting, so with vasovagal attacks, the anxiety and uncertainty engendered by the attacks themselves may be reasonably regarded as a perpetuating or conditioning factor. In some patients the attacks recur at intervals over a period of many years. Sensible psychotherapy and attention to general health bring long or lasting relief to others.

In my series of 93 cases there were 31 men and 62 *women*, 77 per cent. were between the ages of thirty and sixty. Other visceral disturbances, referable especially to the stomach, and *wide spread vasomotor* symptoms may accompany Gowers's syndrome, and cardiac symptoms are not present in all cases. They were recorded in 42 (just under 50 per cent.) of the present series and included precordial pain radiating into the left arm and up into the left side of the *neck, a sense of constriction* in the chest, and feelings of pressure and palpitation. Occasionally there was an associated sense of dyspnœa. Probably most cases formerly called pseudo-angina belong to this group. In 51 cases of the whole series, or rather more than half, angor animi or the sense of dying, a symptom which I have discussed formerly at some length (Ryle 1928, 1936), was the leading symptom. How can so peculiar a symptom *be* accounted *for or* defined?

According to the James-Lange hypothesis (James 1890) the emotion of fear represents the summation of all the sensory effects of the reflex bodily phenomena induced by a terrifying event. It might be argued on this hypothesis that the bodily processes due to the graver known extremity of fear, namely that engendered by an immediate threat of death from some external cause, even when they happen to be otherwise induced, can still evoke the same sensations with the same connexion of death's imminence. The blanched and powerless fear of the subacute criminal or the sensible and the 'frozen' state of the rabbit controlled by a snake or a stoat (a state with which one of my patients compared her own condition) may well include the angor animi of the patient who suffers from Gowers's syndrome. In all these states it might reasonably be argued that the physical sensations cause the emotion and not *vice versa*. When, therefore Clifford Allbutt refers to the feeling of impending death as "an organic sensation" he may be employing, in less explicit form the James-Lange interpretation. Of the reality of the sensation of impending dissolution in a vasovagal attack it is impossible to feel any doubt. Dread and panic may accompany it, but again it is described not as a "fear" but as an actual 'feeling' of dying. Two distinguished colleagues one a physiologist and one a physician, have told me that they had experienced this sensation after an injection of adrenaline.

Is it extravagant to argue that lesser anxieties in a debilitated and nervous subject may sometimes produce the total physical effects of extreme terror? May not new knowledge of the hypothalamus viewed as a "central exchange" or "relaying centre" for the emotional impulse, help to remove existing physiological objections to the views of James and Lange?

CASE 33.—A small highly-strung woman a martyr to migraine," aged 37, was profoundly shocked by the sudden death of her husband during a game of tennis. She straightway felt extremely cold and soon afterwards became conscious of her heart and of dyspnœa on effort and later of precordial pain and a sense of constriction across the sternum, which would develop either with or independently of effort and often wakened her at night. It became impossible for her to push her child's perambulator. There was no sign of organic disease. Blood pressure 110/80. Later she became subject to attacks in which she felt dreadful, not like an ordinary faint, her heart felt enormous, and there was tightness in the chest." One of these attacks immediately followed a bad migrainous episode, in which she had fasted for four days, and terminated with fainting.

CASE 34.—A nervous and introspective young man, with a nervous inheritance, underwent an exacerbation of his natural anxieties in consequence (*a*) of a series of deaths among his immediate colleagues, (*b*) of personal fears of disease; and (*c*) of apprehension in connexion with an imminent return to the east while still unfit, his wife and baby remaining in England. The symptoms which he described were at first regarded as cardiac; later his appendix was removed, and then he underwent treatment with emetine because amœbic cysts were found in his stools, finally duodenal ulcer was suspected and he was given treatment which seemed to make him worse. His actual complaint was of precordial and left axillary pain with radiation down the inner side of the left arm, together with tightness in the chest, difficulty in breathing, and panic. There was no clear reference to food or effort. He was an air-swallower. There were no signs of organic disease.

CASE 35.—A woman, aged 50 overworked, saddled with many anxieties, and with a hypochromic anæmia, described recurrent attacks in which her heart

pounded and she was dyspnœic and had an overpowering sense that she was dying. The acute phase of such attacks would last half an hour, but they would leave her unsettled and anxious for many hours. At the beginning of an attack she experienced a feeling of unreality, and surrounding objects seemed unfamiliar and remote. In one attack with severe angor animi she saw her reflection in a glass; she was very pale with dilated pupils. Shallow breathing was noted and was followed by tetany. Apart from a hæmoglobin figure of 75 per cent. there was no sign of physical disease.

CASE 36.—A medical man, aged 43, liable to migraine from boyhood and with a history of duodenal ulcer at the age of 36, developed attacks characterised by a sense of unreality and of falling through the bed. Simultaneously he had strange feelings in the epigastrium and precordium and a feeling of impending dissolution. He was still liable to hunger discomforts, and the vasovagal symptoms were apt to develop in concert with these. Virginian cigarettes disagreed with him. There were no signs of organic disease.

CASE 37.—A nervous man, aged 46, with a cancerphobia and a liability to flatulent discomforts, was extensively stung by bees in June, 1936. An attack followed in which he had a sense of impending death and a weak slow pulse. During the next six months he had a recurrence of similar attacks. His pulse-rate would be as low as 50 at these times. Other symptoms described were dyspnœa, coldness and trembling. There was a bad psychological family history on his mother's side.

I have elsewhere described in some detail other cases belonging to this group (Ryle 1936). With minor variations there is a striking uniformity in the volunteered or elicited accounts. The dread even of naming the leading symptom may inhibit free description in the early stages of an interview. In two or three cases I have recorded severe pain indistinguishable from that of organic angina, from which the distinction was ultimately made by careful observation of the case over long periods of time, or by a change in the character of the symptoms or the circumstances of the attacks

Multiple Visceral Neuroses

From what has gone before it is clear that there is often an association of several paroxysmal neuroses in one patient, and that these are not necessarily confined to the viscera. Hay-fever, migraine, or angioneurotic œdema may occur in conjunction with the spastic colon or with proctalgia, or asthma with paroxysmal tachycardia. The association of asthma and urticaria with neuroses of the abdominal viscera was noted by Allbutt (1884). Whether we regard the disturbances as manifestations of a humoral or emotional pathology, this is what would be expected, and it is, perhaps, worthy rather of remark that such associations are not more constant. The selective action of particular types of disorder or disease on particular organs or tissues is a chapter of pathology or psychopathology which still remains to be written, and the *locus minoris resistentiæ*, familiar enough to patients and physicians, but rarely finds a ready explanation in anatomy or physiology With one patient or family the stomach, with another the heart, the bowel, or the bladder, with a third the lungs or the joints are recognised repeatedly as "weak-spots" in the constitutional defence.

It is to be noted, however, that multiple visceral neuroses rarely occur together in point of time They alternate in a history or appear at different periods in a patient's life. In this respect we encounter an essential difference between so-called allergy and the more pronounced and specific anaphylactic response. In anaphylactic shock or serum-sickness in man we observe simultaneously or concentrated within a period of hours or days the symptoms of shock, with a profound fall in the blood-pressure; tachycardia; the sense of impending death; angioneurotic œdema; urticaria; asthma, and gastro-intestinal disturbances (usually with diarrhœa) and polyarthritis. As I have shown elsewhere (Ryle 1936) anaphylaxis in its most alarming form may occur in man not only immediately after the administration of serum but occasionally also a week later, replacing the more usual serum-sickness The simple urticarial response is more usual, but in the less severe reactions intermediate between minor serum-sickness and grave anaphylaxis multiple phenomena are common If the spontaneous disease (or allergy) is to be regarded as a true counterpart of the experimental or induced disease (or anaphylaxis), should we not expect occasionally to encounter examples of acute or recurring illness of a spontaneous kind with multiple and synchronous manifestations? Although they are rare, when we consider the great frequency of the isolated or separate manifestations, such cases do occur. A more intimate study of these cases, with a view to discovering the relative contributions of emotion and food or other allergy, would be particularly valuable.

Therapeutics

Of the physician it is naturally expected that he will give some account of the treatment of those diseases to which his attention has been closely drawn In my early years a wise friend advised me never to write on treatment. Apart from some passing commentaries on therapeutic principle I have rarely gone counter to his advice. More follies and fallacies are perpetrated in the name of therapeutics than in any other branch of medicine or medical writing They have been particularly numerous in connexion with the allergic disorders and the visceral neuroses The genuine epoch-making advances today are derived from scientific experiment and the contributions of physiology, chemistry, pharmacology, and immunology. This does not, however, imply that the practising physician need become a nihilist or a disbeliever or deficient in useful method. The treatment of all diseases and especially of those of long persistence and without specific cause and remedy, is the treatment of the patient. It is an individual and personal affair, consisting largely of understanding and management both in a physical and a psychological regard. As such it is beyond adequate description. The best indications for appropriate treatment will be found in the best and most detailed account of the disease and its victims Of no group of maladies is this more true than the functional disorders of the viscera, which, as has been shown, may be viewed as the ultimate expression of personality and inherited constitution in conflict with natural adversity I could wish that my own descriptions had been better, but such as they are they should give the clue to many details of rational treatment.

The first essential is, as always, a diagnosis as confidently made and stated as possible Indecision in the presence of a visceral neurosis, a questioning of "appendicitis," or of "heart-disease" or a "tired heart-muscle," of "inflammation" or "ulceration" in the bowel or bladder, can only perpetuate the anxiety which is the basic disease, or a part of it and will tend to counteract such benefits as may accrue from other reassurance or from diet and regimen however suitably chosen.

The second essential is a simple and reassuring explanation of the nature and genesis of the visceral symptoms themselves and of their innocence so far as life and ultimate prospects are concerned. The third essential is an exploration, with the patient and sometimes with a near relation, of his habits and mode of living, his economic and domestic circumstances, his fears and doubts, and the provision of a definite, but not too elaborate, scheme of readjustment where readjustment is possible. Holidays, hobbies, relaxations, exercise have their part to play. Sensible dietary reforms, without suggesting that food is ever the *causa causans* of the trouble, are of value in heartburn and the colonic neuroses. Avoidance of condiments, strong tea, alcohol, and cooked fats in the former, and of what our American colleagues call "roughage" in the latter, may be reasonably enjoined. Under- or over-nutrition may call for appropriate advice. The purgative habit should be discountenanced. A hot bath may bring ease to an aching colon at the day's end. For paroxysms of tachycardia there are the various although rarely effective "tricks," such as abrupt change of posture, a hot or cold drink, or pressure on the carotids. Drugs should play only a subsidiary part and should be few. Sodium bicarbonate and aluminum hydroxide are useful for heartburn, belladonna, with some patients, for the spastic colon. Bromides are of assistance to some anxious folk but not to all. Barbiturates in judicious dosage may be used for the restoration of sleep lost through fatigue or anxiety or over-activity of mind.

If it be judged necessary to employ accessory methods of investigation, such as X rays, a chemical analysis, or the electrocardiographic tracing, it should be made clear to the patient that this is merely a contribution to thoroughness (which the anxious mind always appreciates) and for fuller definition and reassurance. Such methods can genuinely assist diagnosis and treatment not only by eliminating organic possibilities but also by demonstrating the type of a dysfunction.

Prognosis

Of the neuroses described it may be said, as with asthma, that they scarcely ever kill. Very occasionally paroxysmal tachycardia may cause a fatal failure. Vasovagal attacks appear repeatedly to threaten life, but I have never heard of a death. For the rest it may be said that these organ neuroses again resemble asthma in the variety and irregularity of their behaviour. In some patients they occur once or twice only in a lifetime, in others they recur intermittently through many years. In some they are a cause of continuing distress of mind and body, in others an occasional nuisance arriving only in response to some extra load of care or irritation or a passing indiscretion or without discoverable cause. The graver cases are in the minority, but they can be very crippling and may even lead to periods of bed-ridden invalidism in the less robust. Particularly is this true of mucous colic, paroxysmal tachycardia, and Gowers's syndrome. The prognosis, in the long view, depends very largely on the personal qualities and reserve powers of the individual, on the attitude of relations, and not a little too on the patient's fortune or otherwise in escaping the diagnosis of organic disease and inappropriate physical treatments. The psychiatric ability of the medical adviser can play a really important part sometimes in the actual relief of distress, sometimes in the encouragement given to lead a normal life in spite of it.

Ætiology Reviewed

In reconsidering ætiology should we not now remind ourselves that many people, who otherwise show little evidence of allergy or neurosis, experience on rare occasions in a lifetime one or other of the neuroses under review or some one of their familiar congeners? Are not the best of us at one time or another a little bit "allergic" or neurotic? In taking histories we often obtain an account of a solitary attack of urticaria or of a brief phase of asthma. A mildly migrainous subject myself, but otherwise blessed with excellent health, I have three times in my life at a time of great pressure of work and private anxiety experienced nocturnal proctalgia. An otherwise healthy member of my family has had a solitary attack of urticaria, anaphylaxis after a bee sting, and colon spasm when cold and tired, and once or twice after a bad coryza has had bronchial spasm in mild degree. None of these have ever "made her a patient" in the ordinary sense, and all were so transient that they brought no interruption to a very active life. The diathesis for any morbid state must be an affair of degree as well as kind. About the mean which we call "normal" there extends in either direction an increasing or diminishing degree of liability to certain biological reactions to everyday fatigue and to certain endogenous or exogenous irritants, whether physical or psychological.

Emotion and certain physical factors, such as heat and cold, can produce manifestations commonly ascribed to allergy as well as certain less determinate visceral disorders. To say that neurosis and allergy can be separately recognised and classified is, perhaps, to create an artificial distinction which may hamper rather than assist our diagnosis, our treatment, and our ideas. I am not yet satisfied that this separation in the case of man is biologically sound.

Conclusion

A study of the visceral neuroses is a study of men and women, of personalities and temperaments, of heredity, habits, and environments, and of peculiar biological responses to common but often inconspicuous stimuli. These responses must constantly be thought of in terms of physiology, and for vague concepts and terminologies, such as "nerves" and "nervous heart," we must come to substitute those concepts which Cannon (1936) and Pavlov (1927) have made possible for us by patient experiment and clear exposition. The elementary emotions and reactions of men and cats and dogs are very similar. Amid the fret and swift vicissitudes of the present day and with increasing restraint upon the external expression of the emotions it is not surprising that their internal expression, at times in most of us and often in some, should become erratic and exaggerated.

In explanation of the visceral neuroses and of their tendency to be perpetuated over long periods of time we may invoke an inborn nervous instability, the conditioned reflex or habit, endocrine imbalance, and allergic sensitisation, operating severally or in conjunction. We may come to believe that the ultimate stimulus which promotes the spasm of plain muscle or the cardiac acceleration is specific and chemical. With the aid of physiological and pharmacological experiment we may discover better measures of counteraction and symptom-relief. But in the end our understanding and some of our best protective contributions are likely to derive largely from a clearer knowledge of the whole man, and from improved diagnostic achievement, which, if it

does nothing else, will save countless patients from the suspicion of organic disease and the numerous improper treatments which result therefrom Without this clearer knowledge, moreover, psychotherapy must be denied the full scope and opportunity which its progress now requires.

As Clifford Allbutt (1884) so rightly insisted, the patients whose troubles, following his method, I have set myself to consider are very worthy of help. If they are sensitive and "barometric" they are also commonly intelligent, conscientious, industrious, useful, and active in times of health, and their ailments are very far from imaginary. Indeed, they may be as real and crippling as some of the structural diseases which affect the very organs which torment them.

I believe we would do well for the present not to become too subservient to the idea of specific æthologies, and that in asthma, urticaria, and hay-fever we have, as practitioners, only a little more justification for an exclusive concentration upon the allergic hypothesis than we have in the case of heartburn, proctalgia, paroxysmal tachycardia, and the vasovagal attacks of Gowers. Non-specific therapy may certainly succeed in practice where "specific" measures fail Would it not be wiser, while research continues, just to accept that there are certain human constitutions hypersensitive in their reactions to minor physical stimuli, such as dust in the case of the asthmatic, and cellulose residue or east winds in the case of sufferers from colonic spasm; to minor chemical stimuli, as in the case of the pollen- and horse-sensitive asthmatic and the egg-sensitive individual with his digestive crises; and to those numerous psychical stimuli which are known to be effective in determining so many of the visceral, bronchial, or cutaneous neuroses? Must we not also accept that in most of the patients afflicted with these neuroses any or all of these three types of stimulus may operate with identical effect at one time or another, and that the real rarities are those cases in which there is a single specific stimulus with a single effect? Taking this view, as clinical experience compels me to do, I feel that there is good justification for retaining "visceral neurosis" as a generic descriptive term.

For a more precise appreciation of the morbid behaviour of the viscera we shall look eventually to the contributions of physiology, expecting new light from its further investigations of the hypothalamus and the vegetative nervous system. Biochemistry and psychology will also lend their aid Investigation by the methods of these sciences, however, will never preclude or prove competent without the more comprehensive clinical study of the total natural history of these interesting disorders. Such study must continue to fall to the physician, as human biologist, in his intimate associations with man in health and disease and in that much debated borderland which lies between.

TRANSPLANTATION OF THE URETERS INTO THE RECTUM

BY MIROTVORTZEFF'S METHOD

By Prof. S. P. SHILOVTZEFF

OF SAMARKAND (UZBEKISTAN)

THE operation of transplantation of the ureters into the rectum, first done in Russia by Tikhoff's method in 1905 and then by the method introduced by Prof. S. R. Mirotvortzeff in 1909, soon became established in the treatment of various kinds of urinary incontinence, replacing Maydl's operation and other means of forming an artificial bladder. Maydl's operation proved to be technically more complex than separate transplantation of the ureters and it gave worse results with a higher fatality-rate The ingenious methods of making an artificial bladder, either inside the abdominal cavity or from the skin of the abdominal wall, did not solve the main problem of preventing ascending infection. They led only to stagnation of the urine and precipitation of concretions, while they were quite unsuccessful in eliminating the principal cause of suffering—incontinence—because the new bladder has no sphincter.

MIROTVORTZEFF'S OPERATION

The surgical clinic of the Saratoff Medical Institute has records of 23 cases treated by Mirotvortzeff's method, and I have collected another 48 from other sources, making a total of 71 cases. The operation is performed as follows:

The patient is deeply anæsthetised and placed in the Trendelenburg position. The abdominal cavity is laid open from umbilicus to pubis and the intestines are retracted to the upper part of the abdomen. In small children it is difficult to keep the coils of intestine inside the abdominal cavity and they must be allowed to come out, an assistant keeping them covered with gauze soaked in saline. This increases the difficulty of operating on young patients but it cannot usually be avoided. The cord-like ureters can now be either seen or felt. In all cases of ectopia of the bladder in infants the ureters are dilated, but this is by no means a contra-indication for the operation.

An incision 3–5 cm. long is made in the parietal peritoneum above the ureter, which is isolated as low as possible near the bladder and cut between two silk ligatures. The vesical end of the ureter is touched with carbolic acid and the ligature cut; the stump disappears at the lower end of the abdominal incision. The temporary fixing ligature on the renal end of the ureter is left on, for it prevents the urine from dropping freely into the abdominal cavity, and also helps to keep the ureter close to the intestine for the anastomosis This is usually made in the pelvic colon. One ureter is laid above the other, the left being generally sewn in first. The assistant fixes with his left hand the part of the intestine where the ureter will be transplanted. The surgeon then pulls on the ligature and places the ureter so that it lies obliquely downward and inwards on the intestine, after which three serous sutures are made over the ureter as in Witzel's gastrotomy. The sutures should be placed on the seromuscular layers of the intestine and the adventitia of the ureter far enough apart to avoid pressure on the ureter. The part of the ureter held by the ligature is cut off obliquely so that the slit of the future anastomosis is oval. A sound 12–15 cm. long is introduced into the lumen of the ureter, and its patency is proved if some drops of urine flow out. Afterwards the cut part of the ureter is carefully lifted up with fine ophthalmic forceps, and the serous

and muscular layers of the intestine are incised under it The mucosa of the intestine is lifted up by the forceps as a little cone and the top of it is cut off with curved scissors The small amount of bleeding that sometimes occurs may easily be stopped by simple pressure The end of the ureter is then laid in the incision in the intestinal wall and is united with it by four fine silk sutures, thus forming an anastomosis It is this anastomosis that is the fundamental difference between Mirotvortzeff's and Tikhoff's methods The last stage of the operation is the insertion of several nodal sutures over the anastomosis

After washing his hands the surgeon goes over to the left side of the patient and sews in the right ureter in the same way The abdominal wound is then closed If the patient is a child we cover the wound with adhesive plaster or with broad gauze strips fastened with collodium and then with aseptic gauze A Nelaton catheter is placed in the rectum Owing to neglecting this last precaution we had two cases of intestinal eventration The oblique cut at the end of the ureters, by increasing the size of the opening, prevents contraction of the lumen and consequent ascending infection, it is also helpful technically in making the anastomosis Joining the "cup" of the ureter to the incision in the intestinal wall makes an ideal hermetic union

In Tikhoff's method the ureter is put freely into the rectum after the insertion of some Witzel sutures The absence of mucosa-to mucosa fixation may allow displacement of the ureters into the abdominal cavity This happened once in 90 operations in Tikhoff's cases, but was more common in animal experiments Mayo and Coffey do not use Witzel's sero serous tunnel, but incise the serous and muscular coats of the intestine and then place the ureter superficial to the mucosa They think that the intestinal gases press on the mucosa and thus narrow the wide opening in the ureter and that this may prevent ascending infection There are several objections to their method Uncontrolled and more or less prolonged closure of the sewn in ureters may cause retention of urine and consequent dilatation and atony of the ureters, thus the possibility of ascending infection is not excluded The scar in the intestinal wall over the ureter is considerably coarser when the seromuscular layer of the intestine is cut than when the ureter is placed in the sero serous Witzel tunnel With a skilful operator there is no danger of compressing the ureter in the Russian methods The insertion of a sound is a valuable precaution against obstruction

We regard Coffey's suggestion of putting a catheter into the lumen of the ureter and drawing it out through the rectum as an unnecessary technical complication of the operation He leaves the catheter in the ureters for 8–10 days and sutures the obliquely cut end of the ureter to the catheter with four nodal sutures The extraction of the catheter is a highly dangerous procedure, for the sutures that fix the ureter may easily be torn out and it is possible to damage the mucosa of the ureter itself In one woman who died from peritonitis 17 days after Coffey's operation the left ureter had been pulled 3 cm out of place, and it was gangrenous, we put this down to the presence and extraction of the ureteric catheter Another possible complication is blocking of the narrow catheter by urinary salts

INDICATIONS FOR TRANSPLANTATION

The indications for this operation are well defined

(1) Developmental defects of the bladder ectopia, high epispadias, and absence of the sphincter The operation may be performed even in the youngest infants

(2) Uretero vaginal and vesico-vaginal fistulæ

(3) Malignant and some benign tumours of the bladder

(4) Gunshot wounds of the bladder with multiple urinary fistulæ that do not respond to treatment

(5) Accidental injury to the ureter during pelvic operations when it is impossible to repair it or to transplant it into the bladder

Prof Oppel and Prof Mirotvortzeff are right in saying that these indications will in future be widened At first both authors expressed some doubt about the suitability of the operation in ectopia, the latter regarding Maydl's operation as irreplaceable, especially in children under five years, and in Tikhoff's series of 90 cases of transplantation into the rectum there were only 2 for ectopia We believe that ureter transplantation may ultimately replace Maydl's operation in all cases of ectopia We have proved the possibility of operating at the earliest ages Our youngest patient was five weeks old It is true we lost him, but only because of a fault in technique The operation wound was not covered with strips of adhesive plaster and on the fifth day there was intestinal eventration which required a new operation under chloroform narcosis The child died on the seventh day with symptoms of peritonitis, the ureteral anastomosis was seen to be sound

As early as 1908 Jelinek observed that if Maydl's operation was carried out in childhood there was less chance of an ascending pyelonephritis in later life We have the same impression and think therefore that one of the causes of ascending pyelonephritis in ectopia may be renal disease beginning at some time before the operation We cannot but agree with Prof Oppel that "transplantation of the ureters into the intestine more often aggravates an already existing ascending infection than is the primary cause of one" (Matoussoff)

Undoubtedly the operation is very serious in infants and has a considerable mortality, but ectopia is itself a very dangerous disease The gravity of the condition makes it important to remedy it as soon as possible for the parents' as well as for the patient's sake For the mother it is less hard to lose such a child in the first half year of its life than at the age of four or five We think the best age for operation is six months Technically at this age the operation is not difficult—for the ureters to be sufficiently dilated is rather the rule than the exception—and we have always found it possible to do Mirotvortzeff's anastomosis

TABLE I—FATALITIES IN CHILDREN AND ADULTS

Disease	Operations	Deaths (number and per cent)
Ectopia	12	4 (33 3)
Uretero vaginal and vesico-vaginal fistulæ	6	1 (16 6)
Gunshot wounds of bladder	1	0
Cancer of bladder	4	2 (50 0)
Total	23	7 (30 4)

CAUSES OF FAILURE

We have operated on ten children under four years for ectopia The immediate mortality was considerable Other deformities were present in 3 cases One fatal case had a patent ductus arteriosus; another a rictus lupinus; and in one patient who recovered there was bifurcation of the ureters in the lower part The fatalities in children and adults were as given in table I

TABLE II—RESULTS OF OPERATION. MIROTVORTZEFF'S METHOD

Disease	Cases.	Deaths	Fatality-rate (per cent.).
Ectopia of bladder—			
5 weeks–5 years	16	6	38·1
5 years–10 „	1	0	0 0
10 „ –20 „	15	1	10·0
Over 20 years	5	1	
Total	37	8	21 6
Cancer of bladder	20	10	50 0
Fistula of bladder	12	1	8·3
Tuberculosis of bladder	1	0	0 0
Obstinate cystitis	1	1	100 0
Total	71	20	28·1

The cause of death in two children was shock, and in two others peritonitis In one case of cancer of the bladder we lost a woman from peritonitis. In another a woman died from acute cardiac failure some hours after the removal of the bladder together with all the internal reproductive organs and the transplantation of the ureters; here it would have been better to have operated in two stages We lost one patient after Coffey's operation on the 17th day from peritonitis; the left ureter was gangrenous for 3 cm.

TABLE III—TIKHOFF'S RESULTS

Disease.	*Cases.*	*Deaths*	Fatality-rate (per cent.)
Vesico-vaginal fistula	53	12	22 6
Cancer of uterus and bladder	33	17	51·5
Ectopia	2	2	
Sphincter weakness	1	1	100 0
Tumour of bladder	1	1	
Total	90	33	36 6

upwards from the place where it was sewn in and was lying loose in the abdominal cavity; we consider that this happened because a foreign body—a catheter—was kept in the ureter When he first began his method Coffey had to extract the catheter on the fourth day because it became blocked. In one of our cases we had to extract the catheter on the seventh day after a Coffey operation. Generally it comes out between the eighth and 16th days. To prevent the catheter becoming blocked by urine salts it is advisable to use aspiration, to wash it through with boric solution, and pass a special stilette down it. Extracted catheters usually show thick deposits of urates We regard our method as the simplest and surest way of preventing this.

One death after operation was extremely instructive. A woman aged 28 had had a vesico-vaginal fistula for eight years. The ureters were transplanted into the rectum, and urine began to flow within half an hour after the operation. For five days her condition was satisfactory; then she had severe meteorism, her eyes began to roll up and her nose became sharp, but her pulse was of a good tension at 80–90 a minute, and the abdomen was painless on palpation. Thus the clinical picture was not a clear one of peritonitis. The possibility of a leak in the anastomosis was considered but the daily secretion of 1500 c.cm. of urine allayed anxiety to a certain degree, although between the third and seventh days after these operations there should always be a considerable polyuria (amounting to 3–5 litres a day). The meteorism was increasing every day, and siphon enemata, injections of atropine and pituitrin, and intravenous injections of 10 per cent. saline all failed to give relief. On the 11th day there was clearly intestinal obstruction, with absolute constipation and continuous vomiting A second laparotomy was performed. On removing the first sutures from the abdominal wound a transparent light yellow fluid resembling ascitic fluid flowed out. There was absolutely no urinary smell in this liquid and for that reason it was thought to be ascitic; the laboratory afterwards, however, proved the presence of urinary salts in it. The wound was reopened completely. There were no signs of peritonitis, the intestines being all equally distended, and attempts to find a mechanical obstruction failed. The peritoneum was found to be plastered over the anastomosis and no displacement or perforation was seen. The wound was closed with drainage. The

TABLE IV—RESULTS FROM RUSSIAN AUTHORS (SMITTEN)

Disease	Recovery	Deaths	Total	Fatality rate (per cent.)
Fistula of bladder	125	37	162	22 84
Malignant tumour	37	61	98	62·25
Congenital deformity	41	18	59	30·51
Inflammation	1	3	4	75·0
Total	204	119	323	36 84

patient died with symptoms of cardiac failure 36 hours after this second operation

Post mortem it was established that the right ureter was sewn in higher than usual and its direction was not from above downwards. As a rule the ureter must meet the intestine at an obtuse angle; but in this case it was inserted in an upward direction at an acute angle. The result was a kink of the ureter followed by insufficient nutrition of its wall and a small leak at the anastomosis.

The conclusions to be drawn from this unfortunate case are as follows: (1) The details of this operation

TABLE V—RESULTS FROM RUSSIAN AND FOREIGN AUTHORS (SMITTEN)

Disease.	Fatality-rate (per cent.)	Total cases
Fistula	22·8	214
Congenital deformity	27 6	315
Neoplasm	56 6	181
Inflammation	53·3	15
Total	33 6	755

are clear and the rules of operative technique must be followed; the ureter must be sewn in from above downwards without any kinks (2) With extravasation of urine into the abdomen there is a characteristic picture of paralytic intestinal obstruction with a relatively good pulse. (3) Between the third and seventh days after operation there must be polyuria; even a normal output should lead one to suspect leakage at the ureteric sutures (4) Urine extravasated into the abdominal cavity does not have the characteristic odour. (5) If the patient survives a leakage of urine for 10 days the second operation should be limited to draining the abdomen through a small incision only.

RESULTS OF THE OPERATION

In table II a summary is given of the statistics of recorded cases operated on exclusively by Mirotvortzeff's method. Tikhoff's results are shown in

table III, and those collected by Smitten from Russian and foreign sources in tables IV and V

On comparing these collected statistics it will be seen that the total fatality rate in operations by Mirotvortzeff's method is 5–8 per cent lower than in the others Such comparisons may however err through differences in the clinical material

TABLE VI

Period under observation	Successful cases	Period under observation	Successful cases
0–6 mths	72	3– 5 years	26
6 mths –1 year	47	5–10 „	21
1–2 years	60	10–20 „	19
2–3 „	31		

Many women who have had their ureters transplanted live a long and painless life Women who have undergone such an operation in early childhood have often been able to work hard and have successfully given birth to a child Cases have been reported where childbirth was fatal, and we have also had experience of this Smitten was right in saying that even when the kidneys are healthy it is wiser, in some cases at least, to sterilise the patient

The remote results of 740 operations of transplantation of the ureters into the rectum or of Maydl's operation reported by Smitten were as given in table VI These statistics prove once more what a valuable procedure this is in the relief of the distressing condition of urinary incontinence

The remote results are known in about half of our cases (table VII)

One of our patients became pregnant nine months after the operation Owing to renal insufficiency a vaginal cæsarean operation was performed In the following months she had periodic exacerbations of the pyonephrosis and she died 15 months later with symptoms of uræmia The post-mortem examination showed bilateral pyonephrosis, the lumina of the ureters being quite patent In this case there had been a fault in operative technique, the fallopian tubes being closed with only one ligature so that they soon became potent again

All patients learn to distinguish between urination and defæcation, even in the first few weeks They find that they can easily hold up to 200–300 c cm of urine, and develop a different type of reflex for defæcation

Among the patients operated on by Mirotvortzeff's method three were kept under observation for long

TABLE VII

Period under observation	Cases	Result
5– 6 mths	3	One child died of one of the ordinary infectious diseases, two are healthy
15–18 „	2	One woman died of uræmia after pregnancy one healthy
2–2½ years	2	Healthy
4–4½ „	2	Healthy
19½ „	1	Died of calculous pyonephrosis

periods: one for 15½ years, a second for 19½ years, and a third for 20 years Oppel[1] describes the case of a child of 8 years who was operated on for ectopia of the bladder in 1913, Mirotvortzeff's method being used In 1929 the bladder was extirpated In these 15½ years the patient had felt perfectly well At the Leningrad Pirogoff Society in 1933 Moukharinsky reported a case in which the patient had lived for 20 years after such an operation, and in whom no renal or renal pelvis symptoms had appeared The history of our longest case was as follows

A woman aged 38 was admitted to Mirotvortzeff's clinic on Sept 20, 1930, with symptoms of pyelonephritis Oppel had transplanted her ureters in 1911 because of absence of the bladder sphincter The patient lived 15 years without any complaints and became pregnant four times, an artificial abortion being performed each time The excretion of urine and fæces were separate and called forth by different reflexes The patient lived mainly on vegetable and milk food, she was less fond of meat than before the operation, but more partial to sour foods such as sauerkraut or lemons Her first serious trouble was 16 years after the operation, when she had moved to some northern place and was living in poverty in bad hygienic conditions in damp lodgings At this time she had to keep her bed for 6 months with symptoms of pyelonephritis She kept fairly well after this for 2 years, when the same disease recurred This was followed by an interval of 1½ years and then a fatal recurrence At the post-mortem examination there was a right-sided paranephritis, an abscess and calculus of the right kidney, and an abscess of the liver formed by extension from the paranephritis If we had recognised and opened the paranephric abscess in time it is very probable that the patient would still be alive

CONCLUSIONS

1 The operation of transplantation of the ureters into the rectum in cases of ectopia of the bladder may be performed on the youngest children

2 The remote results of the operation are best when the operation is performed in childhood

3 Clinical observations show the possibility of a trouble-free life for many years after transplantation, but patients must keep to a special diet and take every precaution against damage to the kidneys

4 Mirotvortzeff's operation shows the lowest direct mortality of the methods in use

ANALYSIS OF THE NORMAL P WAVE

By ATHELSTANE HILL, M.D Camb., M.R.C.P., D.P.H

CARDIOLOGIST TO PAIGNTON AND DISTRICT HOSPITAL AND TO NEWTON ABBOT HOSPITAL

FOR analysis of the P wave the same material was used as for the Q R S deflection[1]

The P wave is comparatively simple Throughout the whole of it the lower part of the chest wall is positive to the upper part; and in the lower part the front is slightly positive to the back The upper part of the chest is also very nearly iso electric in this subject, but at first the clavicular regions on both sides are slightly positive to the scapular, becoming distinctly negative at the height of the wave In leads taken from front to back in these regions the P wave, though very small, is unmistakably diphasic The two stages are shown in figs 1 and 2 In the first stage the voltages are so small and vary so much with respiration that anything like accurate measurement is impossible, the total range does not exceed 1·5 decimillivolts The continuous line in fig 1 roughly indicates the boundary between positive and negative and the depth of shading and stippling the degree of positive and negative potential respectively In the second stage more detail is possible, but even so the total range is not more than 3·5 decimillivolts,

1 Hill A *Lancet* 1938, 2, 1116

and the contour lines are only to be taken as approximations.

It is evident that the most positive area in this subject is more centrally placed than usual, for his standard electrocardiogram shows practically no

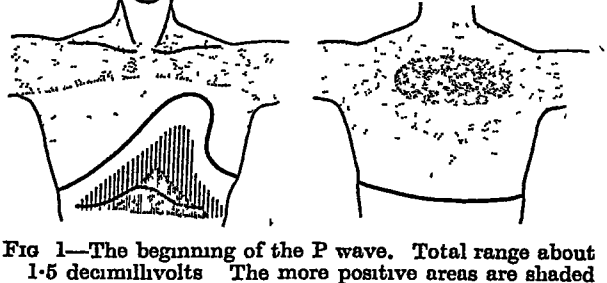

FIG 1—The beginning of the P wave. Total range about 1·5 decimillivolts The more positive areas are shaded and the more negative stippled

P wave in lead I, while it is well developed in the other two leads This may be due to the very thick layer of muscle overlying the apex and præcordium. The voltages recorded by the instrument are "surface" voltages and are approximately proportional to Vr/R, where V is the "intrinsic" voltage at the site of the contraction wave, r the resistance of that part of the circuit which lies between the points of application of the electrodes, and R the resistance of the whole circuit from one side of the contraction wave to the other through the conducting paths to the surface and the intervening length of thoracic wall. Anything that increases R—e g , interposition of fluid between the heart and the chest wall, or greatly increased thickness of the chest wall—will diminish the surface voltage, though the intrinsic voltage remains unchanged. This would account for the low voltages found in pericardial effusion, without the necessity of invoking "tamponnade."

The mechanism of production of the P wave is easy to understand if we think of the contraction wave as a ring of small batteries travelling down the auricles with their positive poles in front and their negative poles behind. When the wave is starting on its journey from the sinus venosus, the whole of the auricular and ventricular blood in front of it will be positive and the blood in the superior vena cava and its tributaries negative. As the ring of batteries advances towards the A–V junction (fig. 3), more and more of the auricular blood will become negative; and, when it finally reaches its destination, just before it ceases to generate electricity, the whole of the blood in the auricles will be negative, while the ventricular blood is still positive. The positive electricity is conducted to the surface through the præcordium and the liver, and the negative to the root of the neck through the auricles and great veins.

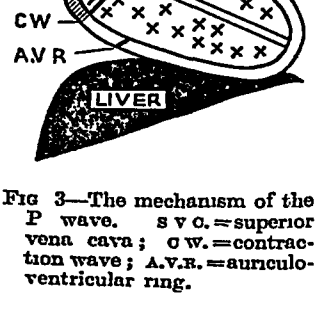

FIG 3—The mechanism of the P wave. S V C.=superior vena cava; C W.=contraction wave; A.V.R.=auriculo-ventricular ring.

This mechanism differs in one particular from that which produces the Q R S deflection In the latter the contraction wave, travelling mainly from within outwards, creates a potential difference between the chest wall and the blood column as a whole; the auricular contraction wave, sliding down over the upper part of the blood column like a sleeve or bracelet, creates a potential difference between the two ends of the blood column If these two events take place simultaneously, the currents will be superimposed and the resulting voltage will be the algebraic sum of the voltages of each wave; the condition is comparable to two batteries connected in series, and the P wave will be superimposed unchanged on the Q R S. But this rule of algebraic summation of simultaneous deflections does not apply to those produced by contraction of the two ventricles, for these are comparable to two batteries connected in parallel; and this does not result in summation of voltage. Thus, though the bi-cardiogram is, in a sense, a combination of dextro- and lævo-cardiograms, it cannot be their sum or even the resultant of their components along some particular axis So, as suggested in my earlier paper, the concept of axis-deviation needs reconsideration. Hypertrophy of a ventricle wall will increase the duration of the current due to its activity, for the contraction wave has further to travel; it is not safe to assume that it will increase its voltage without direct experimental evidence. It seems more likely that the changes in

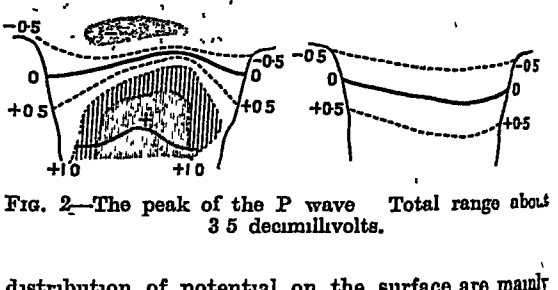

FIG. 2—The peak of the P wave Total range about 3 5 decimillivolts.

distribution of potential on the surface are mainly caused by the effects of associated anatomical displacements on the conduction paths.

This analysis throws some light on the correct method of measuring the P–R interval It is always measured from the beginning of the P wave to the beginning of the Q R S deflection It will be clear that in any particular lead a deflection may appear later than the current giving rise to it if the two points of application happen at first to be iso-electric, but, if three triangulated leads are taken, the deflection can only be late in one of them, except in the rare instances when it is late or even absent in all three It cannot be punctual in one lead only and late in the other two. It follows therefore that in the standard electrocardiogram there must be one lead at least in which both the P and the Q R S are punctual, and this will give the true reading. If in one of the other leads P is late and Q punctual, the interval will be artificially shortened, but, if P is punctual and Q late, it will be artificially lengthened. When, therefore, the measurements in the three leads are all different, the intermediate value (not the longest) is the true one; but, if two agree and one is different, the two that agree are right, whether the third is shorter or longer. This rule does not apply to measurement of a deflection (when the longest value should be taken) or of an interval measured from the end of one deflection to the beginning of the next (when the shortest value is right)

SUMMARY AND CONCLUSIONS

(1) Charts of the potential distribution on the surface during inscription of the P wave are given, and the mechanism of its production is discussed

(2) The conditions necessary to summation of deflections are considered

(3) The measurement of the P–R interval is examined

MALNUTRITION AND DEBILITY IN PUERPERAL PSYCHOSES

By Norah A Haworth, M A Camb, M R C S, D P M

HON ASSISTANT PHYSICIAN LADY CHICHESTER HOSPITAL, HOVE

It is now generally accepted that there is no specific form of mental disorder associated with childbirth and that when mental illness begins during pregnancy, the puerperium or lactation, childbirth acts as any other factor might in precipitating one of the recognised forms of insanity There are, however, in connexion with this particular factor of childbirth certain points worthy of consideration which are not always present in the case of other precipitating factors First, it may be noted from the literature on the subject that it is very often associated with some other contributory cause, and the fact that many of these women have already had one or more confinements, and that many of them pass normally through later confinements, suggests that some other factor of a temporary

TABLE I—WEIGHTS ON ADMISSION

Diagnosis	Total cases	Normal	Above normal	Total	Below normal			Total
					4–7 lb	7–13 lb	1 st or more	
Man depressive	38	6	3	9	9	8	12	29
Schizophrenic	21	2	1	3	2	4	12	18
Confusional	9	1	1	2	1	2	4	7
Total	68	9	5	14	12	14	28	54

nature—i e, arising in connexion with this particular pregnancy—is involved Secondly, during the period of pregnancy, the puerperium and lactation, patients are or should be, under the supervision of their own doctor or of an ante and postnatal clinic, so that if any contributory factor can be found whose elimination will help to minimise the risks of childbirth for potential psychotics, prophylactic measures should here be especially possible In a review of 35 cases of mental illness associated with childbirth, in 28 of which additional precipitating factors are stated to have been present Harris (1936) finds that their presence or absence does not appear to influence the patient's chances of recovery It is, however, possible that without an additional factor the mental illness might never have arisen at all

The most important thing in the study of these contributory causes is the recognition of those which might be eliminated Some such as hereditary predisposition and life long nervous instability, cannot be removed but a knowledge of their presence in the early days of pregnancy should suggest an especial effort to build up the general powers of resistance and to eliminate additional preventable factors Of the preventable contributory causes it is suggested that the two most important are (1) malnutrition and general debility, and (2) stress and anxiety, emotional or environmental The following observations on 117 cases of mental illness arising in connexion with childbirth, who were admitted to Severalls Mental Hospital over a period of fifteen years, show how common these factors are All the patients except 6 were admitted during the late months of pregnancy during the puerperium or during lactation In every case this was the first occasion on which the patient had been admitted to a mental hospital, 72 of the patients recovered, 60 had already had one or more normal confinements, and 12 have had one or more confinements since their discharge from hospital without developing any mental symptoms

WEIGHT AND GENERAL HEALTH

The weight on admission to and discharge from hospital was noted in 68 cases A certain number of

TABLE II—ALTERATION IN WEIGHTS WHILE IN HOSPITAL

Diagnosis	Increase				No change or decrease
	4–7 lb	7–13 lb	1st or more	Total	
Man depressive	2	10	23	35	3
Schizophrenic	1	1	13	15	6
Confusional	1	6	2	9	0
Total	4	17	38	59	9

patients were not weighed on admission, some being too ill physically (20), others mentally The weights on admission have been compared with those given by Hutchison and Hunter (1938) as the average for normal women, age and height of course being taken into consideration The weights of 40 healthy members of the nursing staff approximated closely to this standard

The figures in tables I and II give some idea of the degree of malnutrition found in a great many of these women It will be seen that on admission 54 of the 68 cases (nearly 80 per cent) were below normal weight, 28 (41 per cent) being more than 1 st under weight, the remaining 14 patients were of normal or above normal weight

Table III shows the alterations in weight while in hospital of the 54 patients who recovered, and it

TABLE III—ALTERATION IN WEIGHTS WHILE IN HOSPITAL OF PATIENTS WHO RECOVERED AND WHO DID NOT RECOVER

Diagnosis	Recoveries		Not recoveries	
	Increase	No change or decrease	Increase	No change or decrease
Man depressive	32	1	3	2
Schizophrenic	12	0	3	6
Confusional	9	0	0	0
Total	53	1	6	8

will be seen that in every case except one recovery was associated with an increase in weight (over 1 st in 36 of the cases who were below normal on admission) while 8 of the 14 cases who did not recover showed no change or a loss of weight

Only 28 of the 117 patients (23·9 per cent.) were found to be in satisfactory general health when admitted to hospital, none of these showing any sign of physical disorder. The majority were suffering from minor physical ailments; 80 had dirty, furred tongues and were and had been suffering from constipation; over 60 had carious teeth or pyorrhœa or both; 32 were suffering from anæmia, and, as has been shown, a great many were poorly nourished and underweight

On admission 20 patients were seriously ill; these included 5 suffering from nephritis, 2 of them associated with streptococcal infection of the vagina; 2 eclampsia; 1 pyosalpinx; 3 toxæmia (2 associated with pyelitis); 2 lobar pneumonia; 1 bronchopneumonia; 1 phthisis; 1 severe anæmia; 1 valvular disease with anæmia; 1 follicular tonsillitis; 1 anæmia and ulceration of prolapsed rectum; and 1 hyperthyroidism. All had pyrexia on admission.

Less seriously ill but in poor physical condition were 11 cases of heart disease; 5 with a bloodstained vaginal discharge three or more weeks after confinement; 3 of arteriosclerosis; 3 of erosion of cervix; 3 of torn perineum; and 1 case of each of the following: vaginitis, breast abscess, nephritis, cystitis, bronchitis, pharyngitis, tonsillitis, otitis media, furunculosis, gingivitis, syphilis, measles, scarlet fever and thyroid deficiency.

In an address to the British Medical Association Dame Louise McIlroy (1937) suggested that "it is within the bounds of possibility that one of the determining causes of puerperal sepsis is defective nutrition with consequent lowering of resistance." It is also within the bounds of possibility that such defective nutrition with consequent lowering of resistance may play a considerable part as a determining factor in mental breakdown, especially in cases where nervous instability and environmental or emotional stress are also present.

STRESS

A history taken in the early days of pregnancy would have shown that 36 of these patients belonged to families in which a near relative had suffered from insanity, epilepsy or alcoholism; 29 had at some period in their life already shown signs of nervous instability; while 22 had undergone long and severe stress. The following records give some idea of what has been accepted as "stress" sufficiently severe to be a possible precipitating factor.

In 2 cases the patient's husband had been out of work for over two years; both these women already had three children and both owing to financial difficulties were themselves in an undernourished condition. A woman admitted during the puerperium suffering from measles had thirteen children, and had been nursing several of them with measles and running her home during her pregnancy. In another case the husband suffered from "shell-shock" and was in an acute anxiety state prior to and at the time of his wife's confinement which took place in her own home. Of the lactational cases, 2 were themselves in poor health but owing to financial difficulties were still nursing their babies a year after their confinements. A woman who had had a "nervous breakdown" seven years previously when she already had five children, and who had never really felt fit since this illness, had had two more children during these seven years but broke down at the birth of the eighth. Mentally abnormal relatives were living with 2 patients. Another lived throughout her pregnancy in constant fear of becoming like her mother, who had developed a chronic psychosis at childbirth when her own child was born In 1 case the husband, wife, a small child, and the newborn baby were living in one room Altogether 5 patients had given birth to illegitimate children.

It will be noted that in many of these cases the source of anxiety is also one of the sources of the mother's state of undernourishment and debility Jones pointed out in 1903 that the incidence of puerperal psychoses was considerably higher among the rate-aided patients than among those of the "private" class; the same fact has been recorded in reports of the Board of Control and it is also true for the present group of cases. The difference in incidence between the two classes is large and suggests that precipitating factors may be present in the one which are absent in the others; of these, the first that come to mind are malnutrition, and financial and general economic stress. Codet and Badonnel (1924) emphasise the importance of the mother's attitude towards childbirth; where it is a desired event, joyfully anticipated and not likely to lead to financial and other difficulties, there is much less likelihood of symptoms associated with anxiety and fear developing than where the child is unwanted or where the presence of another member in the family is going to be the source of financial difficulty or an added burden to an already overworked mother A friendly discussion, during the early months of pregnancy, of fears, anxieties, and emotional and environmental difficulties will in itself often do much to overcome them, and it will probably be possible to relieve at least some of the troubles brought to light in this way, and thus to reduce the stress and anxiety to which the patient is being subjected.

As has already been mentioned this group of potential psychotic patients is in a peculiarly favourable position for prevention, if such is possible, in that they are under supervision during the period immediately preceding the possible onset of mental illness, a time when prophylactic measures, both psychological and physical, may be of value, and when the earliest symptoms suggestive of mental breakdown—irritability, restlessness, undue fatigue, emotional instability and that almost universal early symptom insomnia—may be noted and dealt with. The opportunity is present for dealing with minor physical disorders and with sources of auto-intoxication, and much can be done to improve the general condition and build up powers of resistance

It will be seen that of the group here investigated a great many patients had had to cope not only with childbirth but also with an inherited instability and/or malnutrition and a poor physical condition, and/or considerable stress and anxiety Up to this time they had managed to cope with life (all were first admissions to hospital) and might still have done so if their physical condition, their power of resistance, and that "additional precipitating factor," stress and anxiety, could have been attended to in time

SUMMARY

Analysis of a series of cases of puerperal psychoses showed that the majority were much under weight and in poor physical health; about a quarter had been exposed to severe economic or emotional stress.

Many cases could probably be prevented by attention to nutrition, general health and environmental conditions early in pregnancy

My thanks are due to Dr. R C. Turnbull for permission to use the hospital records.

AFTER-EFFECTS OF EXPOSURE OF MEN TO CARBON DIOXIDE

BY W ALEXANDER, B Sc, P DUFF, J B S HALDANE, F R S, G IVES, AND D RENTON

(*From the Department of Biometry, University College, London*)

IN connexion with the loss of H M submarine *Thetis*, it was desired to determine the effect on men of breathing oxygen in an escape apparatus after prolonged exposure to air containing high carbon dioxide and low oxygen The air in the submarine was under a pressure of about 8 cm Hg above the atmosphere, the volume per man being 4710 litres From the accounts of survivors it was judged that when they left the submarine after 17–18 hours' confinement the partial pressures were approximately CO_2 6 per cent, O_2 16 per cent, N_2+A, 87 per cent of an atmosphere

J S Haldane or Lorrain Smith (1894) breathed air in a closed chamber for 7½ hours until the CO_2 rose to 6 4 per cent, and the O_2 fell to 13 per cent On emerging he had a headache and vomited J B S Haldane (1924a, 1924b) had the same symptoms after 1½ hours' breathing air originally containing 5–6 per cent CO_2 and in which the CO_2 rose to a maximum of 7 3 per cent He always vomited when the final percentage exceeded 6 5

On the other hand Long (1924) had observed headache and nausea in two subjects breathing mixtures of CO_2 and O_2 in which the maximum CO_2 percentage was 11, and the maximum time of exposure fifty minutes He did not record any aggravation of symptoms on breathing fresh air, though the symptoms continued for some time The additional O_2 may have been responsible for this difference It was therefore considered probable that the men in the *Thetis* suffered from headache and/or vomiting on breathing pure O_2 in their escape apparatus, these symptoms being due to the sudden fall in the CO_2 and not to the rise in O_2 breathed However it was clearly desirable to find out whether an aggravation of symptoms was normal in such circumstances

THE PRESENT EXPERIMENT

Messrs Siebe Gorman and Co kindly put a steel chamber of 5800 litres' capacity at our disposal The conditions in the *Thetis* were duplicated as far as possible, the pressure being kept at about 1 1 atmospheres, and the CO_2 brought up to between 6 and 7 per cent, whilst the oxygen fell correspondingly The figures given for CO_2 are partial pressures, that is to say percentages multiplied by 1 1

A preliminary experiment was done to determine whether a gradual rise in CO_2 pressure had the same effect on J B S H as an abrupt rise

He let N_2 and CO_2 into the chamber at 10 10 P M and the pressure was adjusted so that the partial pressure of CO_2 was 2 5 per cent, that of O_2 being about 20 per cent The CO_2 then gradually rose and the O_2 fell owing to his breathing The pressure fell from time to time owing to a slight leak, but was kept up with compressed air, so that the ventilation of the air followed much the same course as in a submarine The dry bulb temperature varied from 70°–71° F the wet bulb being 2°–4° lower

J B S H slept intermittently from 12 30 to 8 30 A M when the CO_2 pressure was 5 1 per cent Panting was marked but there was no distress At 10 50 the CO_2 had reached 5 8 per cent and the panting was severe, with slight headache, photophobia, and transient nausea At noon the respirations were 44 per minute, but the pulse-rate was only 60, as compared with a normal figure of about 75 At 12 40 the CO_2 had risen to 6 6 per cent, and there was slight confusion, though the headache was not severe and there was no vomiting He left the chamber, and put on a Davis escape apparatus

After 2–3 minutes he removed the mouthpiece in order to vomit, which he did at intervals, probably bringing up about a pint of clear fluid He had not eaten or drunk for the previous sixteen hours, in order to parallel conditions in the submarine A violent headache developed, mainly frontal but somewhat diffuse This was severe for about an hour, and passed off about 5 P M Later he felt unusually well

Four days later all of us entered the chamber, and remained for one hour in air with a high CO_2 content and correspondingly low O_2 The partial pressure of CO_2 was originally 6 1 per cent, but rose rapidly After half an hour air was added and the pressure lowered, but at the end of the hour the CO_2 pressure had risen to 6 7 per cent Unfortunately duplicate O_2 determinations did not agree, and the partial pressure of O_2 may have been as high as 18 7 per cent

At the end of the hour all were panting severely, and P D, who was awaiting operation for the sequelæ of five wounds received in Spain, was in considerable distress On leaving the chamber all except J B S H put on Davis escape apparatus W A removed the mouthpiece almost instantly, and vomited repeatedly, though he had had no food since a light breakfast seven hours earlier, and is a good sailor and does not vomit readily in other circumstances He had a moderate headache P D and D R had very severe headaches developing within a few minutes, and both were temporarily incapacitated J B S H and G I had slight headaches developing after 10–15 minutes All had recovered after three hours

The slightness of J B S H's symptoms on this occasion suggests that the after effects depend on the time over which air containing above 5 5 per cent of CO_2 is breathed, rather than on the concentration at the end of the experiment It is however possible that on the occasion of the second experiment he was acclimatised to some extent In view of his experience in 1923 this is unlikely

DISCUSSION

In each of six persons who have breathed air containing CO_2 at a partial pressure of over 6 per cent with normal or subnormal O_2 for an hour, there has thus been an aggravation of symptoms other than panting, when air or O_2 was breathed, and three out of the six have vomited On the other hand there are marked individual differences in the symptoms J B S H's slight symptoms in the second experiment may have been due to his previous experience, but this could not apply to G I since none of the rest of us had ever taken part in tests of this kind Similarly P D's severe headache may have been partly due to his ill health But this could not apply to W A and D R

It will be remembered that at least one of the men who tried to escape from the *Thetis* pulled off the mouthpiece of his escape apparatus and was drowned, and that only 4 out of 103 succeeded in escaping It is suggested that some of the remainder were incapacitated by vomiting or other symptoms It seems that in such circumstances men should breathe air or oxygen for 30 minutes or more before attempting to use the escape apparatus under circumstances where vomiting is fatal, and where calmness and some physical exertion are required

It must however be emphasised that the experiments here described were conducted hurriedly,

so as to permit one of us to give evidence at the judicial inquiry. There can be no doubt that experiments more scientifically carried out, on larger numbers of men, would give more definite results. Moreover a careful investigation of the vasomotor and other changes involved might throw light on the causes of headache. This can hardly be due to a sudden increase in the alkalinity of the tissues. For J B. S. H. has frequently overbreathed so as to render himself so alkaline as to develop tetany and excrete a urine containing so much bicarbonate as to froth on adding acid. This has never produced a headache. On the other hand on one occasion he produced a severe acidosis with NH_4Cl He then ate about 40 g. of $NaHCO_3$ to restore his pH to normal This produced a severe but transitory headache, perhaps analogous to that here described.

SUMMARY

After breathing air with a partial pressure of over 6 per cent. of CO_2 for an hour or longer, five men experienced headache on breathing oxygen, and two of them vomited. The bearing of this observation on escape from submarines is discussed.

ANTITUMORIGENIC ACTION OF PROGESTERONE

BY PROF. ALEXANDER LIPSCHÜTZ,
RUPERTO MURILLO AND LUIS VARGAS, Jun.

(*From the Department of Experimental Medicine, National Health Service, Republic of Chile, Santiago*)

UTERINE and extra-uterine abdominal fibromyomas produced in the guineapig by subcutaneous injection of follicular hormone develop in the non-castrated female with less constancy and in a lesser degree than in the castrated female (Lipschütz and Iglesias 1938, Lipschütz and Vargas 1939a and c). The difference in behaviour of castrated and non-castrated females is statistically significant (Lipschütz, Murillo, Vargas, and Koref 1939) and suggests that the antitumorigenic action of the ovary is due to the luteal hormone. This is corroborated by the following experiments.

Five castrated female guineapigs (225–475 g.) received subcutaneous injections of 80 µg. of œstradiol (the benzoic ester in olive oil) thrice weekly. Two of these animals were treated for 47 days and three for 90 days All the animals revealed at autopsy uterine or extra-uterine tumours (figs. 1 and 2).

Five castrated female guineapigs (385–510 g.) were treated in the same way and with similar quantities of the benzoic ester of œstradiol. After 30 days three subcutaneous injections of 12 mg. of progesterone in olive oil were given weekly besides the 80 µg. of œstradiol. Two animals were killed after 47 days and three after 90 days. Only one animal (treated for 47 days) developed uterine tumours (fig. 3); there were no tumours, uterine or extra-uterine, in the four others The total quantities of progesterone given were 84 mg. in 17 days and 288 mg. in 60 days; the relation between œstradiol and progesterone per injection was 1 to 150.

Most female guineapigs treated for two to three months with an ester of œstradiol show, besides uterine and extra-uterine tumours, also a remarkable development of hard fibrous tissue in the mesentery,

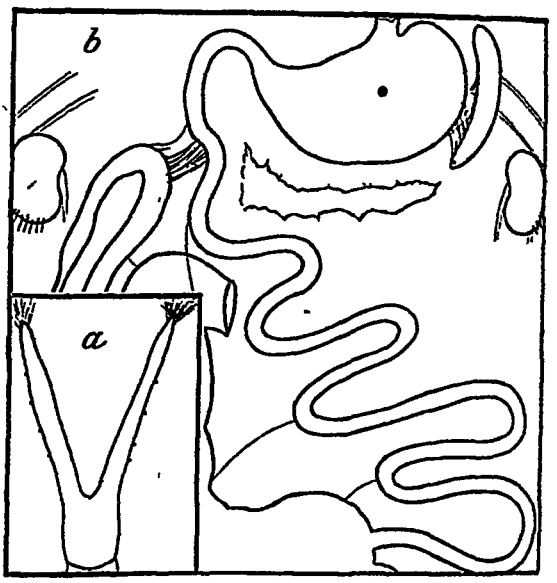

FIG 1—Diagram showing sites of uterine and extra uterine fibroids in a castrated female guineapig which had received œstradiol benzoate 80 µg thrice weekly for 47 days. (*a*) small parametrial tumours, mark 0·5 and apical uterine fibrosis, mark 0 5, (*b*) fibrosis round kidneys, in mesentery, and between stomach and spleen, subserous gastric tumour, mark 1, and small tumours on surface of spleen, mark 0 5 Total mark 2 5

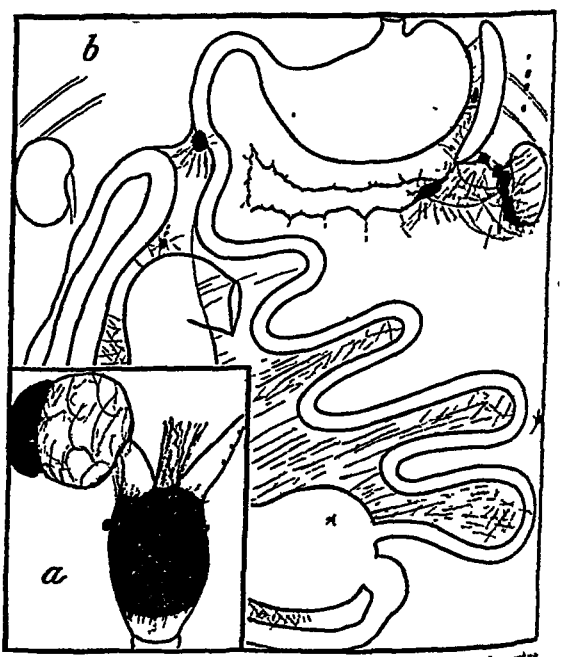

FIG 2—Diagram showing sites of uterine and extra uterine tumours in a castrated female guineapig which had received œstradiol benzoate 80 µg thrice weekly for 90 days · (*a*) enormous tumour of ventral surface of uterus, mark 3, with adhesion of the epiploön, small parametrial tumours, and cystic dilatation of right tube with big tumour, mark 3; (*b*) tumours in mesentery, hilum of left kidney, and abdominal wall, mark 2, in hilum of spleen, mark 1, and fibrosis of mesentery, mark 0 5 Total mark 9 5

round the spleen and kidneys, and elsewhere This fibrous reaction was present also in the animals receiving œstradiol and progesterone but in a smaller degree than in those animals receiving only œstradiol

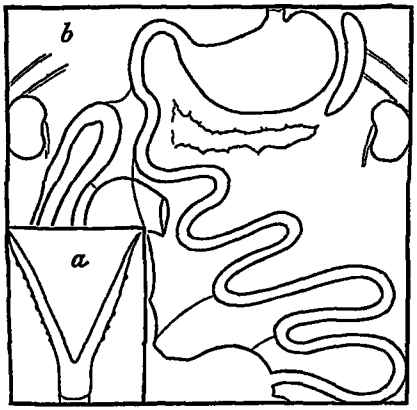

FIG 3—Diagram showing sites of uterine and extra uterine tumours in a castrated female guineapig which had received œstradiol benzoate 80 µg thrice weekly for 47 days and simultaneously during the last 17 days progesterone 12 mg thrice weekly (*a*) small parametrial tumours, mark 1, (*b*) small tumours on spleen, mark 1 Total mark 2

For the purpose of comparison we use a system of marks for tumours and fibrous tissue (Lipschütz and Vargas 1930b) The average mark of the group receiving only œstradiol was 4, the average mark of the group receiving œstradiol and progesterone was 1

Our experiments with progesterone, though few, suggest strongly that this substance exerts an anti tumorigenic action The quantity of progesterone necessary to suppress completely the tumorigenic action of œstradiol benzoate is more than 150 times greater than that of the latter According to Courrier and Cohen Solal (1937) the œstrogenic action of œstradiol also is suppressed by a quantity of progesterone 200 to 400 times greater than that of the œstradiol

Our results support the hypothesis that the development of uterine fibromyomas in women is due to a disturbance of the normal balance between follicular and luteal hormones and of their normal timing (Lipschütz 1939), and that progesterone may prove useful as a therapeutic agent against fibromyoma (*Lancet* 1939)

Our thanks are due to Messrs Ciba, of Basle, and Laboratoires du Dr Roussel, of Paris, for the benzoic ester of œstradiol, and to Messrs Organon, of Oss (Holland), for the progesterone.

AMYLOIDOSIS COMPLICATING STILL'S DISEASE

BY ALEX H IMRIE, M B Glasg., M R C.P
PHYSICIAN IN THE OUTPATIENT DEPARTMENT AND ASSISTANT PATHOLOGIST, ROYAL INFIRMARY, GLASGOW, AND
ANNE C AITKENHEAD, B Sc., M B. Glasg
ASSISTANT PHYSICIAN IN THE OUTPATIENT DEPARTMENT OF THE HOSPITAL AND JUNIOR ASSISTANT TO THE MUIRHEAD PROFESSOR OF MEDICINE, UNIVERSITY OF GLASGOW

THE following case presents unusual features in that diffuse amyloidosis developed in the course of Still's disease, there being no evidence, either during life or at autopsy, of suppuration, tuberculosis or syphilis

CASE RECORD

A girl aged 7 years was admitted to the Glasgow Royal Infirmary on April 21, 1932, suffering from pain and swelling of ankles and knees which had been present for six months Her mother said that since the child had had acute rheumatism at the age of 3 years she had been subject to vague pains in the limbs

On admission she was well nourished but small for her age There was some swelling of knees, ankles and tarsal joints of both feet, but no tenderness or limitation of movement Radiography of joints showed no abnormality Her tonsils were enlarged and the fauces were congested The abdomen was normal and the cardiac sounds were pure Her temperature rose to 99° F on three occasions during her seven weeks' stay in hospital, but otherwise there was no pyrexia The urine was normal

In August, 1932, little change was noted on physical examination, but by November her general condition had deteriorated Her wrists were swollen as well as her knees, ankles and tarsal joints and the tonsillar lymphatic glands had become palpable Between November, 1932, and March, 1933, various signs appeared suggesting an "infective" source of her arthritis For six weeks there was continuous irregular pyrexia up to 102° F uninfluenced by sodium salicylate On two occasions she had a fleeting erythematous rash and the spleen became palpable She had a slight degree of anæmia (Hb 82 per cent, red cells 4,170,000) and a polymorph leucocytosis (25,800 per c mm, polymorphs 78 per cent). However, by March, 1933 her general condition showed improvement She spent the remainder of 1933 partly in hospital and partly in a children's home in the country By the end of the year the proximal interphalangeal joints of the index and middle fingers had become affected and there was stiffness of the cervical spine At this time her tonsils were removed

The next three years were spent in the country On Oct 6, 1936, she was readmitted to the Infirmary, when it was evident that the disease had not been arrested by tonsillectomy and abundance of fresh air and sunlight She was now 11 years old small for her age but well nourished in face and trunk Her limbs had lost much muscle substance and there was also some atrophy of the small muscles of the hands She had a typical rheumatoid deformity of the fingers and hands The wrists and elbows were moderately swollen and early contractures prevented full extension of these joints There was fullness of knees and ankles with slight limitation of movement Radiography showed osteoporosis The lymphatic glands of neck, axillæ and groins were now palpable, the spleen had increased in size and the edge of the liver could just be felt There was no ascites and, apart from a systolic murmur of functional type, cardiac examination was negative Leucocytosis persisted (21,000 per c mm polymorphs 85 per cent) and the anæmia had increased (Hb 60–65 per cent red cells 3,970,000–4,000,000) Blood-culture and Wassermann reaction were negative The fundi were normal In October and November she ran a

slight pyrexia, which occasionally reached 102° F. at night. Thereafter her temperature was normal, except for several days in February, 1937, until the few weeks preceding her death at the end of March, 1937, when it again rose. Her pulse-rate varied from 86 to 130 per min. during her pyrexial periods, remaining fairly constant at 110 per min. at other times

Her urine was normal in October, 1936. During her intermittent fever it contained a trace of albumin, which slowly increased after her temperature had returned to normal so that it could evidently not be interpreted as a febrile albuminuria. For three months the albuminuria was moderate (Esbach 1–8). With the slight pyrexia in February, 1937, the albuminuria increased and during the seven weeks before her death the Esbach readings showed striking daily variations (2 to 24). In spite of such gross albuminuria casts were notably scanty. From time to time the centrifuged deposit contained a few granular or hyaline casts. There was no hæmaturia and the specific gravity was normal. The urinary output varied considerably; as late as March 6 the day's volume was 2300 c.cm. Slight ascites was noted in November, 1936, but it was not until two months later—after ten to twelve weeks' frank albuminuria—that œdema of face and limbs was found. Following the brief fever in February, 1937, the œdema and ascites increased considerably. Paracentesis of the abdomen was performed on two occasions, 40 and 45 oz. of clear fluid being withdrawn, containing protein 220 mg., sugar 108 mg., and chlorides 662 mg. per 100 c.cm. Her blood-pressure showed a slight rise from 90–100/60 in October, November and December to 110/70–80 in January, February and March.

From March 18, 1937, abdominal pain became increasingly severe and she required frequent doses of Nepenthe. She vomited several times daily. On March 25 her facies was hippocratic. Apart from two occasions in the last week when she was stuperose, she remained conscious until she died on March 29.

POST-MORTEM EXAMINATION

The body was very œdematous, the œdema involving the arms, legs and trunk. The heart was slightly dilated, the myocardium being pale and soft; the valves and coronary arteries were healthy. Both lungs were œdematous. The peritoneal cavity contained a quantity of turbid fluid. The liver was of a firm, rubbery consistence and gave a strong amyloid reaction with iodine. The alimentary canal presented no abnormality. The spleen was firm and gave a strong amyloid reaction of the sago type with iodine. The kidneys were pale, the capsules stripped easily and both organs gave a strong iodine reaction for amyloid. The suprarenal glands appeared to be normal but were not examined for amyloid. The brain presented no abnormality. The knee- and ankle-joints were swollen and the periarticular tissues were thickened and adherent. The cartilages of the knee-joints were eroded and the synovial membranes were opaque and thickened.

HISTOLOGY

Liver.—The parenchyma cells were separated into small groups by a homogeneous, eosinophil substance which gave the characteristic amyloid staining reactions with iodine, gentian violet and Congo red. This substance was most plentiful around the central veins of the lobules although it did not actually involve them, but was laid down in the walls of the liver capillaries. From the central parts of the lobules the amyloid material spread peripherally.

Spleen.—The malpighian bodies were enlarged, consisting almost entirely of amyloid substance, which extended into the pulp for some distance, compressing the surrounding reticular tissue. The central arterioles were in the main free from amyloid but a few showed a deposit of it in their walls

Kidneys.—Many of the glomeruli were fibrosed and destroyed. Of the remainder, the majority presented a rich deposit of amyloid in their capillary walls; in the medulla, amyloid was present in the walls of many of the inter-tubular capillaries. A very small quantity was also present in the walls of a few capillaries in the thyroid gland and in the submaxillary salivary glands. None, however, was detected in the stomach wall, the cervical glands, the heart muscle or the periarticular tissues of the knee-joints.

DISCUSSION

Amyloid disease is a well recognised sequel to chronic suppurative diseases but it may also follow chronic non-suppurative conditions and still more rarely it arises as an apparently primary phenomenon. The original classification into localised and general forms put forward by Wichmann (1893) was in general use until Lubarsch (1929) distinguished a typical or commonly recognised form, and an atypical form. Various other classifications have been suggested and the most comprehensive appears to be that of Reimann and others (1935), who distinguished (1) primary amyloidosis, (2) secondary amyloidosis, (3) tumour-forming amyloidosis, and (4) amyloidosis associated with multiple myeloma. They admit however that there may be overlapping even in this classification

In the primary form the tissues affected in the more common secondary form are not involved, the amyloid process affecting mesodermal tissues, especially those of the cardiovascular system, gastro intestinal tract, smooth muscle and lymph nodes, the amyloid material also shows variations in staining reactions and tends to form nodular deposits. Pseudo-sclerema and macroglossia are usually present (Pick 1931). This type is relatively rare, only about 35 cases having been recorded by Strauss (1933)

The secondary type is by far the more common. Here the amyloid is deposited in the liver, spleen and kidneys and gives the typical staining reactions. Tumour-forming amyloidosis tends to resemble the primary type in distribution but actual tumour masses consisting of amyloid substance are formed. Amyloidosis associated with multiple myeloma is a comparative rarity, 37 recorded cases being reviewed by Magnus-Levy (1933); the distribution here also resembles that of the primary type

The present case is an example of the secondary type, and is remarkable in that there was no evidence of any of the primary diseases commonly associated with amyloidosis. Perla and Gross (1935), in reporting 3 unusual cases of amyloidosis, describe that of a girl aged sixteen years who had a ten-years history of recurrent attacks of arthritis. At the time of death her right elbow-joint was ankylosed because of thickening and shortening of the capsule but there was no evidence of suppuration; extensive deposits of amyloid were present in the liver, kidneys and suprarenal glands and death was due to uræmia. This case is comparable in certain respects to that described here. Both patients were young girls, both had a long history of arthritis with repeated short pyrexial attacks and both finally manifested some of the symptoms of chronic nephritis with œdema.

We are indebted to Prof. J. W. S. Blacklock for his helpful criticism and to Prof. A. W. Harrington for permission to publish the case.

ANTIPELLAGRIC PROPERTIES OF QUINOLINIC ACID *

BY RICHARD W VILTER, M D
AND
TOM D SPIES, M D

(From the Department of Internal Medicine, University of Cincinnati College of Medicine, the Cincinnati General Hospital, and the Hillman Hospital, Birmingham, U S A)

Bills, McDonald and Spies (1939) have shown that pyrazine monocarboxylic acid and pyrazine 2 3-dicarboxylic acid are antipellagric substances Woolley, Strong, Madden and Elvehjem (1938) have reported that quinolinic acid, the 2 3 dicarboxylic acid of pyridine, does not cure canine black tongue Recently Dorfman, Koser and Saunders (1938) and ourselves have found that quinolinic acid is effective as a *growth factor for the dysentery bacillus in synthetic* amino acid medium Because of the apparent variations in the response of *different species*, and because of the chemical relationship between pyrazine 2·3 dicarboxylic acid and quinolinic acid, we studied the response of seven selected pellagrins in relapse to quinolinic acid (Eastman)

Each of six patients who had moderately severe symptoms of pellagra received 1000 mg orally, in *divided doses, over a period of five hours* In every case response was dramatic The fiery red glossitis and stomatitis faded within six hours after the first dose of quinolinic acid was given, and the tongue and mucous membranes regained their normal colour at the end of twenty-four hours The burning sensations subsided, and the patients reported increased strength and sense of well being *following treatment* One of these patients was confused, apprehensive, nervous, and emotionally unstable These symptoms were less noticeable within three hours after the administration of the first dose of quinolinic acid, and the patient appeared normal mentally *at the end* of twenty four hours One severely ill patient was admitted to the hospital and was given *1000 mg of* quinolinic acid each day for three days At the end of forty eight hours the colour of the tongue returned to normal, the Vincent's angina disappeared, and the macerated bullous dermatitis on the feet had begun to heal In the seven cases the concentration of co enzymes I and II in the blood increased from the low values found in pellagrins in relapse to normal values twenty four hours after quinolinic acid had been given

It has been shown previously (Spies, Bean and Stone 1938) that pigments soluble in ether and having a reddish purple colour in 25 per cent HCl appear in the urine of pellagrins in relapse but that they are not found in the urine of dogs with black tongue The present study demonstrates another biological difference between human pellagra and canine black tongue Apparently, all the organisms which require pyridine nucleotides for normal cell respiration do not necessarily use the same pyridine derivatives for the biological synthesis of these nucleotides Such biological variations can be explained by differences in the ability of the organism to utilise these compounds

* This study was aided by grants to the University of Cincinnati from the Rockefeller Foundation and the John and Mary R Markle Foundation

SUMMARY

1 Quinolinic acid is curative for human pellagra
2 The concentration of co enzymes I and II in the blood increased following the administration of quinolinic acid
3 Studies are in progress to ascertain the comparative usefulness of quinolinic acid and other therapeutic agents specific for pellagra

A CASE OF AYERZA'S SYNDROME

BY J A BROCKLEBANK, M D Lond, M R C P, D M R E

ASSISTANT RADIOLOGIST TO ST MARY'S HOSPITAL, PADDINGTON CLINICAL ASSISTANT IN THE RADIOLOGICAL DEPARTMENT AT GUY'S HOSPITAL, LONDON

MANY references have been made to a condition—variously described as atheroma of the pulmonary arteries (Rogers 1908), *cardiacos nigros* (Arrillaga 1913), Ayerza's disease (Warthin 1919), primary sclerosis of the pulmonary artery (Bedford 1927, MacCallum 1931), and syphilis of the pulmonary artery (Hare and Ross 1929)—in which the prominent symptoms are extreme cyanosis, dyspnœa, polycythæmia, *cough*, and *enlargement of the right* chambers of the heart, with ultimate cardiac failure

Rogers (1908) described 10 cases which at *autopsy* showed atheroma and dilatation of the pulmonary arteries for which no cause was found He suggested syphilis as a cause, owing to its prevalence in Bengalis, although only 2 cases showed definite post-mortem evidence of gummata Arrillaga (1913) credited Averza with describing the syndrome in an unpublished clinical lecture in 1901 and concluded that the causes of *cardiacos nigros* were chronic *pulmonary* diseases leading to emphysema, and that syphilis might be a predisposing factor Weber (1913) collected several cases in which he thought chronic pulmonary disease was a principal cause, and later (Weber 1920) did not think syphilis an important factor

Histological evidence of syphilis has been produced by Warthin (1919), Clarke et al (1927), Konstam and Turnbull (1929), and Hare and Ross (1929); but MacCallum (1931) reported a case in which the pulmonary vessels showed intimal thickening and a diminished lumen without any other morbid change Sokoloff and Stewart (1933) reported a similar example, which they described as hyperplastic sclerosis of the vessels Other non-syphilitic cases in which chronic pulmonary disease was present have been described by Clarke et al (1927) Bedford (1927), and Paine and Platt (1931) Reviewing 21 cases, Hare and Ross (1929) concluded that syphilis was the most important cause in older patients but that a primary sclerosis developed in *younger subjects* Fotheringham (1929) described an interesting case in which the pulmonary arterioles showed typical histological changes of thrombo angiitis obliterans, and Montgomery (1935) found thrombosis of branches of the pulmonary artery

Since 1930 there have been several contributions from South America (Ramos 1932, Blas Mola 1934, and, notably Castex and Capdehourat 1932, 1933, 1934, who with Munzel in 1937 considered the bronchial factor to be always an antecedent) Other cases are recorded by Samorici and Sack (1933), de Miguel (1935),

Legrand (1935), and others. Paretzky and Jorgensen (1936) considered the radiographic features to be a dilatation of the right ventricle and pulmonary artery and a movement of the diaphragm synchronous with systole and diastole ("dance of the diaphragm") superimposed on the respiratory movements. Kerley (1936) said that sclerosis of the smaller vessels appeared as small, round, and sharply defined opacities bigger than miliary tubercles, decreasing in size towards the periphery, and that the appearance closely resembled pneumoconiosis but could be distinguished from it by the absence of emphysema. In Ireland Freeman (1935) reported a case with a positive Wassermann reaction but no histological evidence of chronic disease of the lungs or pulmonary vessels. Rothschild and Goldbloom (1938) described the changes as an obliterating arteritis and suggested an allergic factor with vascular spasm from which pulmonary fibrosis developed secondarily. Atkinson (1938) surveyed the reported cases but came to no conclusion regarding the ætiology. Oszacki and Szczeklik (1938), following 19 cases to autopsy, found syphilis to be unimportant and could not distinguish between primary sclerosis of the pulmonary artery and sclerosis secondary to chronic cardiorespiratory disease. They concluded that sclerosis of the pulmonary artery did not necessarily produce the symptoms described by Ayerza.

CASE-RECORD

A caretaker, aged 51, had suffered from a cough on and off for years and was first admitted to hospital in January, 1937, being dyspnœic and very cyanosed. There were many expiratory rhonchi in the lungs and moist râles at the bases, with a moderate amount of sputum. After three weeks his bronchitis had cleared up and he was discharged although still slightly cyanosed.

He was readmitted in November, having had increasing dyspnœa on exertion for five weeks and swelling of the ankles, but no cough or sputum. His appearance was striking: an intense plum-coloured cyanosis, which was much aggravated by exercise and out of all proportion to the degree of dyspnœa. There was no clubbing of the fingers, the pulse was regular, and the heart was apparently not enlarged and gave no evidence of valvular disease. The lungs were emphysematous, and a few dry râles were heard at the bases. The liver was palpable and slightly enlarged but not tender. The spleen could not be felt. There was slight œdema of the ankles only.

A blood-count showed 126 per cent hæmoglobin and 7·5 million erythrocytes per c.mm. The Wassermann reaction was negative. Electrocardiography showed considerable right ventricular preponderance. Radiographically the heart did not appear to be enlarged. There was a general increase in the pulmonary vascular shadowing but nothing to suggest that it was due to anything other than vascular engorgement.

His condition improved and, although remaining very cyanosed, he was discharged after eight weeks without being distressed. He was again readmitted in April, 1938, suffering from gross failure of the right heart, intensely cyanosed, orthopnœic, with much œdema of legs and lumbar pads, and ascites. Death ensued in four days.

Autopsy (Dr. A. C. Counsell).—A well-nourished subject showing gross œdema of legs and scrotum. Each pleural cavity contained about one pint of clear effusion. There was much emphysema of the pulmonary apices and anterior borders, with bullæ. The lung substance was indurated and congested. There were severe tracheitis and bronchitis. Pus was expressed from a few areas in the bases. There was gross right-sided hypertrophy and dilatation of the heart, affecting auricle and ventricle. About one pint of clear peritoneal fluid was found in the abdomen. The liver was congested and the spleen enlarged, hard, and dark red.

Microscopical section revealed dilatation of the bronchioles, catarrhal desquamation of the lining cells, and a mucoid exudate in the lumina. There was fibrosis of the peribronchial tissue, an infiltration with chronic inflammatory cells, and a diminution in the bronchial musculature. The lung substance showed chronic venous congestion superimposed on a severe emphysema. There was no pulmonary fibrosis. The arteries showed much medial hyperplasia without any change in the intima.

COMMENT

Ayerza's syndrome has many constant clinical features, the degree of polycythæmia being the most variable. It is found in a variety of pathological conditions, most of the cases being associated with chronic cardiopulmonary disease. The histopathological feature most constantly found is a sclerosis of the smaller pulmonary vessels; but in some cases this is absent. It may be that these conditions are merely predisposing and that the fundamental cause is undiscovered, or, more probably, that there is nothing specific about the syndrome, which depends on a decreased pulmonary circulation. The term Ayerza's syndrome offers a convenient clinical description but does not denote a disease entity.

I am indebted to Dr. J. B. Cook, medical superintendent of the West Middlesex County Hospital, for permission to publish this case; and to Dr. T. Nelson, senior physician, and Dr. A. C. Counsell, assistant pathologist to the hospital, for their assistance.

". . In the secondary schools, colleges and universities there are made available to students a vast array of courses for giving special training in almost any field one could wish to study. It seems surprising, however, that, of the students from these schools, so many of them seem to lack just what one would expect educated people to possess. They have such strong prejudices, political prejudices, social, religious, class and racial prejudices. They are so easily influenced and controlled by slogans, by propaganda and by dogma. They are so lacking in critical judgment, in poise, and so little given to looking for, and critically evaluating the evidence on both sides of a question. In fact, it often seems that people who have had a formal education are likely to have stronger prejudices, are less eager or less willing to hear both sides of a question than are those with less schooling. They are often more smug, more self-satisfied and less reasonable. This may be due to the fact that their training has made them complacent . . ."
Prof. OTIS F. CURTIS, *Science*, Aug. 4, 1939, p. 94.

CLINICAL AND LABORATORY NOTES

EFFECTS OF AN ARTERIOVENOUS ANEURYSM

By I DOUGLAS MILLER, F R C S
HON ASSISTANT SURGEON, ST VINCENT'S HOSPITAL, SYDNEY

In the following case an opportunity presented of studying the alterations in circulation produced by an arteriovenous aneurysm of considerable size

A man aged 43 consulted me because of an indolent ulcer over his left tibia, which had resisted all treatment and was enlarging It was associated with varicose veins He said that for twenty years he had had increasing palpitation and dyspnœa on exertion This had led to cessation of work two years ago, and since then he had led the life of an invalid He had been seen by many physicians, and his cardiac condition had been variously investigated and diagnosed as myocarditis

On *examination* I found in the region of Hunter's canal a most arresting thrill synchronous with the heart beat There was a small scar over the medial aspect of the thigh, and the patient said that twenty years previously a pea rifle bullet had entered here and traversed his thigh He had been aware of the thrill ever since but had not attached any importance to it In the upper part of Hunter's canal there was a very large compressible pulsating swelling A thrill was conducted from it down to the knee and could be felt all over the hypogastrium On auscultation the bruit, which sounded like a "train in a tunnel," was audible all over the abdomen and even in the upper part of the other thigh The superficial veins of the abdomen and lower part of the thorax were palpable, rather tortuous, and pulsating The patient had obvious bounding pulsation in the neck, a typical water-hammer pulse, and capillary pulsation

On compression of the arterial anastomosis he complained of intense discomfort in the head There was an immediate and most pronounced drop in the pulse rate The normal rate was 72, and immediately on compression the rate fell to 50 beats a minute The blood-pressure was that of an aortic regurgitation brachial 132/61, left leg 120/60, and right leg 100/110 On occlusion of the aneurysm the brachial blood-pressure changed to 143/92 This occlusion reduced the pulse-pressure by 20 mm Hg The blood pressure in the left leg, taken below the aneurysm, was very much less than the pressure in the sound leg The heart was enlarged, the apex-beat being 5½ in from the middle line Radiography confirmed this finding

When the patient was about to be operated on I introduced wide bore needles into the saphenous veins to observe venous pressure On the right it was 28 cm water, and on the left 36 cm water These readings are, of course, very high In an endeavour to find out the alterations of blood return to the heart Dr F Cotton, of the physiology department in the University of Sydney, obtained the following figures by the acetylene method oxygen consumption 248 c cm a minute, and cardiac output 6 1 litres a minute

At *operation* I exposed a very formidable set of blood vessels a vein as large as the normal inferior vena cava, extending from just below the inguinal ligament to the lower end of Hunter's canal, and an artery which appeared to be very much bigger than normal I considered it advisable to work with a tourniquet It was difficult therefore to be sure of the site or the nature of the anastomosis There were many small surrounding veins, which were rather adherent to the main vessels I was able first to isolate the vein low down in Hunter's canal and to separate it very gently from the artery up to a point where I thought the anastomosis was placed I then separated the vessels as high as possible and traced them downwards In this way I approached the communication from a safe distance both above and below The communication was not obvious, but the two vessels were attached side to side for about 1 5 cm Above this point the artery was twice normal size and below was much smaller than normal I performed a quadruple ligature and removed the vessels and anastomosis intact The remainder of the vessels retracted very much, and we were left with an empty Hunter's canal—a rather frightening sight

Effects of operation.—Immediately on removal of the tourniquet the leg flushed and became warmer than before operation The pressure in the saphenous vein dropped to 28 cm water, equal to the other side Within a few days the ulcer had healed After the operation the pulse rate was 88 the pulse lost its "water hammer" quality, the brachial blood-pressure was 130/90, the oxygen consumption was 251 c cm per minute, and the cardiac output was 3 8 litres per minute

Description of anastomosis.—The internal diameter of the arterial inlet was 12 mm and the outlet 4 mm The arteriovenous communication measured 10 mm in each direction

This case gave an excellent opportunity to study an arteriovenous defect which simulated an aortic regurgitation We were able to observe that, while the anastomosis existed, there was almost 100 per cent increase in the return of blood to the heart and a consequent doubled cardiac output

I am indebted to Dr F Cotton for his work on this case and to my house-surgeon Dr W P Ryan for making numerous observations

AN INSTRUMENT FOR CLEARING THE COMMON BILE-DUCT

By D LANG STEVENSON, F R C S
RESIDENT SURGICAL OFFICER AT SMITHDOWN ROAD HOSPITAL, LIVERPOOL

The removal of stones from the biliary tract is much simplified by the technique described here In the first case in which we employed the method a stone was impacted low down in the common bile duct The usual manipulations through an incision in the duct had failed to move the stone at the ampulla, so that a trans- or retro-duodenal approach seemed unavoidable Before this procedure was undertaken, it was suggested that a ball ended needle that we have used for injecting varicose veins might be more effective than either sounds or forceps The needle was accordingly boiled up It was passed down the duct as far as the obstruction, and a 20 c cm Record syringe, which had been filled with saline, was attached Fairly forcible injections were then made at intervals while the ball end was manipulated into different positions, under the additional control of the thumb and index finger of the right hand In this way the stone was successfully dislodged and pushed on into the alimentary canal, some smaller stones and debris were washed back and removed through the incision in the duct Patency was insured by passing the instrument into the duodenum

This manœuvre took only a short time and caused comparatively little trauma The method has subsequently been used in two smaller cases with equally satisfactory results It has also been effective in the more or less straightforward case for clearing the duct of biliary mud and soft stones A soft stone can be withdrawn quite easily by producing

suction with the syringe Success in removing an obstinate calculus by this method is probably due mainly to temporary uniform dilatation of the duct by hydrostatic pressure. It is possible that by this means resort to the trans- or retro-duodenal approach may often be avoided.

The needle used, which is made by Down Bros of London, was originally designed for injecting the distal varicose saphenous system from above and was later found an advantage in embolectomy (see *Lancet*, 1938, 1, 27, 723 and 786) It is 10 in long with a cannulated copper ball about 1/5 in in diameter at the distal end. It fits a standard Record syringe and is flexible to a certain extent, in virtue of its length. For biliary work the needle may have to be slightly bent towards the end.

BRITISH MEDICAL ASSOCIATION

SCIENTIFIC MEETINGS, JULY 26–28

SECTION OF NEUROLOGY AND PSYCHOLOGY

WITH Dr. R. DODS BROWN (Aberdeen) in the chair, this section discussed the

Significance of Auditory and Visual Hallucinations

Dr. P. K. MCCOWAN (Dumfries) said that formerly psychiatrists thought it important to differentiate clearly between hallucinations and illusions Today the two phenomena were considered so closely allied that their presence was of equal significance. In certain cases, however, it was essential to differentiate between them, and sometimes the prognosis depended on this successful differentiation. Hallucinations in the sane were met with in poets, philosophers and religious mystics, and perhaps in ecstatic moments such people recovered the clairvoyant powers formerly possessed by man. At one time man understood his relationship to nature and to his fellow men by a process of pictorial and visual intuition, whereas today he understood the relationship by observation, experience and thought There was thus in the process of civilisation a change in the mode of perception and man unfortunately had, through neglect, lost the former method of experiencing This explanation was more in keeping with the lives and work of these men of genius than the derogatory alternative that their unusual experiences were really manifestations of temporary madness Emphasis had now swung from the sensory to the subjective elements in hallucinations. Formerly it was held that the hallucination was a mental image so vivid that it was misinterpreted as a perception. Today the hallucination was regarded as a more-or-less ordinary image or thought, misinterpreted as a perception by the faulty judgment of the patient While such a theory seems to explain the phenomenon of the acute hallucination, it was not convincing in cases where consciousness was clear. Such patients do not regard their experiences as ordinary perceptions, but describe them in terms of things heard or seen, for want of more appropriate words. This was well illustrated by Mayer-Gross's case in Bumke's handbook. Morel furnished experimental evidence in his audiometer investigations in finding that patients were unable to compare the pitch and intensity of their "voices" with the sounds of the audiometer

Dr. MACDONALD CRITCHLEY (London) said that various neurological conditions, for example brain tumour, migraine, epilepsy and narcolepsy, could cause hallucinations. Hallucinations sometimes occurred in the sane—mass hallucinations, viridical and telepathic dreams. Kavanthy in "A Journey round my Skull" referred to the hallucinatory noises which occurred during the early development of a cerebellar hæmangioblastoma. Stransky's symptom of *Gedankenhoren* occurred in temporal lesions and optical allo-æsthesia in occipital lobe lesions But it was unwise to lean too heavily upon the occurrence and nature of hallucinations in localising intracranial lesions for they may be provoked by compression of cerebral arteries against the edge of the tentorium, or simple internal hydrocephalus "Peduncular hallucinosis" of Lhermitte (a syndrome of mild confusion and lilliputian hallucinations) occurred most often in pituitary or juxtapituitary tumours. In drug intoxications a distinction should be made between acute delirium after poisoning from a single massive dose and states of chronic intoxication. Bromide intoxication produced hallucinations of hearing and sight and sometimes the latter had a lilliputian character. Cannabis indica produced hilarious intoxication followed by vivid hallucinations as Gautier and Baudelaire described in powerful language D. H. Lawrence's beautiful account of the hallucinations produced by mescal and De Quincey's description of opium visions were well worth reading

Prof. HUGH CAIRNS (Oxford) said that in a series of 800 cases of verified intracranial tumour about 100 had experienced visual hallucinations From a study of this series it was apparent that hallucinations in their crudest forms consisted of flashes of colour or white light without form or shape More often the vision had definite shape and movement, usually away from the patient More complex hallucinations related always to past experience; it is the diplomat who served in Japan and not the cook from Whitechapel who sees the Japanese warrior in tortoiseshell armour. But the ideas behind the hallucinations were simple and crude—pictures almost without a story In no sane patient were they endowed with a purpose, as in the psychoses. With the hallucinations or independent of them, there were sometimes distortions of vision—for example, lilliputian hallucinations. Visual hallucinations were not linked with visual defects and earlier writers such as Henschen and Horrax, laid too much stress on the position of visions More important were the phenomena accompanying them. Hallucinations were usually short-lived but sometimes they had the deliberate quality of migrainous images In a few cases of the series the diagnosis was made more difficult by the presence of visions Hallucinations as presenting symptoms, seemed to be especially characteristic of tumours of the occipital, parietal or temporal lobe In two cases hallucinations occurred during ventriculography. From a study of this series it could be concluded that visual hallucinations could be produced by lesions involving any part of the cerebral cortex, optic nerves and chiasma and probably optic thalamus. This was understandable because of the elaborate nervous mechanism necessary for vision, and its correlation with other sensory impressions, and with space and movement Visual hallucinations were as perfect a physiological expe-

ment as any that we were able to devise or understand Electrical stimulation or excision of parts of the cortex were crude methods of revealing the activity of the cortex It was only by the evidence of visual hallucinations that we were able to get any indication of the visual functions of the frontal lobes

Dr W S MACLAY (London) said that knowledge of hallucinations had depended mainly on verbal descriptions by patients of their experiences Such description was not always satisfactory and could contain fallacies Graphic representation provided additional information which might be more reliable and more objective In work on the drawings of schizophrenic patients, it had been found that the scope of the investigation was apt to be limited by the patient's ability to draw Some artists were found who volunteered to take enough mescalin to cause hallucinations They then made sketches during and after the intoxication Such pictures showed the typical mescalin patterns, ability to see structures at the back of the eye, photopsia, repetitive appearance of visual phenomena, wave like distortion of vision, and a tendency of things to elongate themselves In the series the elaboration which changes elementary visual sensations into hallucinations could be demonstrated In the earlier pictures the repetitive phenomena could be explained in purely physiological terms, but in the later ones more and more additional features appeared which could only be accounted for in psychological terms The comprehensible contents were in fact superimposed on the physiological phenomena which interfere with the definition of the visual perceptions Both physiological and psychological considerations must be taken into account

Dr G W B JAMES (London) thought Dr McCowan's suggestion that hallucinations were a reversion to a more primitive type of thought an important one, and instanced the cinema and modern art as examples of such a trend Lilliputian hallucinations were in his experience rare He had seen only six cases in eighteen years' practice and all occurred in alcoholic, renal or senile cases He thought that they were of grave prognostic significance especially in senile patients

Dr E J C HEWITT (Shenley) drew attention to the importance of bromide intoxication, which tended to produce confusion and hallucinations The blood-bromide should be estimated in all cases having bromide for any length of time He had never encountered lilliputian hallucinations

Dr K W TODD (Gold Coast) asked whether telepathy had been sufficiently studied in its relation to hallucinations Intuition would also repay scientific investigation

Dr RICHARD LAGER (Exeter) quoted a case of a woman admitted to his hospital as an epileptic, who saw everything upside down and wrote words backwards Investigation showed that this was a functional condition and not epilepsy and she made a complete recovery

Dr D BLAIR (Edinburgh) said that he had frequently been consulted about patients who were hallucinated as a result of an intense interest in spiritualism or religious thought He quoted a case of this type which recovered on rest in the country Dr Critchley's and Professor Cairns's references to hallucinations in cases of intracranial tumour interested him for he had had a case which began with a hallucination of smell and later showed typical signs and symptoms of suprapituitary tumour

Dr D ROSS (Aberdeen) pointed out that lilliputian hallucinations were not always pleasurable and quoted a case of a woman who saw a minute news reel of her husband being murdered

Dr D R MACCALMAN (Aberdeen) referred to hallucinations in cardiac disorder which, in his experience, were usually of horrifying scenes or of large furry animals floating through the air Hallucinations of hearing of the tinnitus type were most distressing to the patient Professor Cairns had quoted a case in which cutting of the optic tract cured crude hallucinations of sight and yet cutting of the eighth nerve did not alleviate tinnitus Many hallucinations were defensive, this was well illustrated by Dr McCowan's patient whose hallucinations kept her from screaming He wondered whether patients who had hallucinations of organic origin had better insight than did psychotic patients

Dr MCCOWAN, replying, said that hallucinations in the sane were of an entirely different character from hallucinations in the psychotic, the regression theory did not necessarily explain psychotic hallucinations One of his cases had pleasant lilliputian hallucinations, but he was unable to assess their significance because the patient would not discuss them

SECTION OF OPHTHALMOLOGY

AFTER Mr W CLARK SOUTER, the president, had reminded the section that it last met in Aberdeen in July, 1914, a discussion was held on

Ophthalmic Services to the Civilian Population in National Emergency

Colonel ARCHER IRVINE-FORTESCUE (Aberdeen) began by giving a dramatic description of his experiences in Belgium twenty two years ago when the resources of his unit were disorganised by the sudden arrival of some 2000 men blinded by mustard gas, at a hospital equipped for only a few hundred cases He spoke of the dismay and difficulty of the situation, made worse by ignorance of the effects of mustard gas at that time Rough and ready methods had to be resorted to and he urged the meeting to consider the horrors of unpreparedness He then passed on to consider the effects of air raids apart from gas on the civil population Lessons could be learnt from the war in Spain and he deplored the "ex cathedra punditry" which had allowed no unofficial reports from Spain to be considered and discussed Two extremely useful books—namely, "Air Raid" and "A R P Lessons from Barcelona"—already existed and he recommended their study They emphasised the suddenness and completeness of the disorganisation that could be caused by high explosives He thought all ophthalmologists should press for the formation of corps of consultants and for uniformity of procedure, since at the moment the matter appeared to be in the hands of some two hundred separate local authorities, mostly at loggerheads He went on to discuss treatment and the equipment of mobile travelling ophthalmic units

Mr ARNOLD SORSBY (London) cited the motto of Marischal College, Aberdeen, "They say What say they? Let them say," which he interpreted as the utterance of defiance or despair. In his case it represented despair He considered the problem from the two angles of modern warfare—namely, *Blitzkrieg* and terrorisation of the civil population At a rough calculation he estimated the probable casualties in London alone in the first fortnight of a war as 340,000 From 40 to 50 per cent would be fatal, but this left us with a colossal problem He did not think the danger of gas so great as that of high

explosive by which multiple major injuries were caused, the eye injury being only part of the picture. He dealt briefly with treatment and recommended evacuation of the civil population and organisation of base hospitals.

Prof. A. J. BALLANTYNE (Glasgow) spoke of the necessary organisation and the need for better instruction of first-aid workers in irrigating and examining eyes. He pointed out that in Spain the first-aid posts had been abolished finally, and all cases taken direct to hospitals. He dealt with the possibility of every doctor carrying certain equipment in his car and thus becoming a mobile unit constantly ready.

Mr. W. J. B. RIDDELL (Glasgow) referred to the use of cocaine and other corneal anæsthetics as a temporary preliminary treatment, to allow of evacuation of numbers of people temporarily blinded by gas

This opened a lively discussion on the merits and demerits of treatment by vasoconstrictors and local anæsthetics. It brought out the need for further knowledge in view of the evolution of a new group of vasoconstrictors since the war The opinion of the meeting was about equally divided between the view that cocaine was of value in alleviating symptoms and should therefore be used and the view that it damaged the corneal epithelium and led to ulceration. Colonel Irvine-Fortescue upheld the latter opinion very strongly. As regards the action of the ephedrine group of drugs it was felt that insufficient knowledge was available for a definite ruling.

Convergence Deficiency

Miss IDA MANN (London) showed by an analysis of 6400 case-sheets that convergence deficiency appeared to be responsible for the symptoms in roughly 2 per cent of cases in private practice. It bore no relationship to age or error of refraction, though it was often associated with a neurotic or unstable history. This was not always the case, however, and by an appeal to Gordon Holmes's work on the cerebral integration of ocular movements she had attempted to explain the anatomical and physiological basis of the condition The treatment, which was very promising, 69 out of 71 cases treated showing cure or improvement, consisted in improving "facilitation" of the cerebral pathways concerned by re-educative exercises designed to increase the range of voluntary convergence and the efficiency of stereopsis at the near point. The orthoptic exercises employed aimed in the first place at dealing with retinal neglect in cases with a strong master eye, by means of Wells's charts; this was followed by exercises in the voluntary production of physiological diplopia by convergence; and finally the patient was taught to fuse stereoscopic pictures by convergence without the use of a stereoscope In this way full voluntary control of the extrinsic muscles and of accommodation could often be obtained and the symptoms disappeared.

Mr. O. GAYER MORGAN (London) referred to cases from his own experience bearing out these theories Mr MYLES BICKERTON spoke about the convergence amplitude required by the Royal Air Force, and Professor BALLANTYNE pointed out some important factors in testing for the condition.

Chemotherapy in Ophthalmology

Mr. FREDERICK RIDLEY (London) said that today chemotherapy was held to be almost synonymous with treatment by one of the sulphonamide group of drugs, but actually it had a much wider meaning than this. It should be defined as the use of an antibacterial substance capable of destroying o. inhibiting bacteria in the tissues or on the surface of the body in a concentration harmless to the tissues. It therefore differed from shock or immunisation therapy and one must consider its effect on the natural defences of the body. If it lowered or destroyed these it was harmful; for example, eusol was an excellent bactericide but it also destroyed and inhibited the formation of lysozyme and therefore should never be applied to the conjunctiva He then proceeded to deal with the various groups of drugs used as local applications in ophthalmology—salts of heavy metals, and antiseptics such as acriflavine and mercurochrome—and the action of the sulphonamide group either for local or general use Among these last he had a slight preference for M & B 693. He described some hopeful cases in which both pneumococcal and gonococcal conjunctivitis had cleared up with remarkable rapidity after administration of sulphonamides in the usual dosage It seemed important, however, to start the drug just at the point where the patient's own immunity was beginning to come into play, for it would then act synergically and the maximum effect would be obtained Of the chemotherapy of trachoma it was not yet possible to speak dogmatically.

Mr. GAYER MORGAN proposed a new ætiological classification of traumatic myopia, according to whether it is traceable to (1) spasm (ciliary muscle and sphincter papillæ); (2) partial rupture of the zonule; (3) changes in the lens; or (4) serious damage to the coats of the eye causing axial lengthening

Mr. COLE MARSHALL read a paper and showed a film on the treatment of retinal detachment The PRESIDENT showed films of operations made by Professor Weve of Utrecht and Mr. H. B Stallard

---

SECTION OF ORTHOPÆDICS AND FRACTURES

Mr ALEXANDER MITCHELL (Aberdeen) was in the chair for a discussion on

Delayed Union and Non-Union of Fractures

Mr R I STIRLING (Edinburgh) said that in normal healing of long bones the deposition of calcium and other salts was due to the action of phosphatase on the monophosphatic esters at an optimum pH of 8 4. Fluid aspirated was at first mainly blood at pH 7·4; at later aspirations it became more acid (pH 4 7 on the fourth day), later it swung over to alkalinity, up to 8 2 or more At this stage phosphatase was active. Calcium in the hæmatoma fluid was 10–20 times the normal blood figure Experiments in vitro showed that a hypercalcæmic fluid stimulated bone cells The causes of non-union were manifold First were gross separation of the fragments and interposition of periosteum or soft tissues between the fragments, which might lead to pseudarthrosis Interposed tissues must be removed. Lack of immobilisation caused repeated rupture of blood-vessels and so interfered with the chemistry of the hæmatoma fluid. Damage to the nutrient artery delayed union, for the collateral circulation was not fully established under 3 weeks; in such cases longer immobilisation was needed. If this precaution was ignored non-union resulted, especially in fractures of the mid-shaft of the humerus. Gross damage to vessels and nerves of the limb led to failure of mesoblastic tissue formation and so delayed union. Repair might cease through inadequacy of blood content. Vitamins A and B were normally deficient in the hæmatoma fluid, but if vitamin C was deficient there was

abundant callus formation with delayed union Vitamin C should therefore be given early even when there was no deficiency, as was practised by Hertz of Copenhagen In diabetes and hypothyroidism union might be accelerated by administration of the deficient hormone but glandular extracts in ordinary cases were of no proved value In compound fractures a Vaseline pack could supply the missing bone factory wall Injudicious operations and use of metal plates sometimes delayed union Experiments in vitro showed that calcium was not absorbed in the presence of metal Even stainless steel was no advantage Sepsis was a very potent cause of non union But the vast majority of examples of non union were due to inaccurate anatomical reduction or to inadequate immobilisation

The CHAIRMAN interpolated an account of a young man who 6 months after a plating operation in a fractured femur fell, broke the plate and was found to have no union whatsoever at the fracture site

Mr NAUGHTON DUNN (Birmingham) said investigation of the cause of non union was an essential preliminary to operation Syphilis must be excluded or treated In compound fractures the nature of the original infection should be ascertained Hendry in 1936 found 9 cases of delayed gas gangrene as the cause of non union In Henderson's 211 cases of non union at the Mayo Clinic, 66 per cent had been plated At Guy's Hospital between 1911 and 1914, 457 cases had Lane's plates applied In 1934, only in 6 cases was this done This was surely conclusive evidence against the method One must always ask if union would improve function Sometimes any operation would be harmful Sometimes osteotomy or removal of fragments might be the procedure of choice Where an appreciable gap occurred in ununited fractures of long bones, this could only be successfully bridged by an autogenous bone graft In a case of fracture and effusion into the lower radio ulnar joint with abolition of pronation and supination, removal of a piece of the lower third of the *ulna restored* the movement A postman who walked 18 miles a day without inconvenience on the shortened leg had an ununited fracture with extreme deformity of the tibia and fibula at the lower end Operation would here have been unwise In fracture of the patella and internal malleolus removal of a fragment restored continuity and function For non union with fragments in contact for example flail shoulder or elbow, Mr Dunn described an operation which had been successful in 22 consecutive cases The principle was to utilise *living bone grafts* to surround the fracture at the site of non union The bone ends were exposed and freshened and, when necessary, subcortical grafts were inserted around the fragments In non union of the tibia following osteomyelitis, transposition of the fibula resulted in reduction of shortening and restoration of stability Success had attended transposition of the fibula in two cases of congenital non union of the tibia

Dr PHILIP D WILSON (New York) criticised sweeping condemnation of plating Lane's plates were disastrous, the studies of Venable and Stuck had shown that the presence of metal gave rise to electrolytic action with calcium and other salts and delay resulted But if Vitallium a cobalt chromium alloy was used this did not occur Operation was not often necessary but when it was done it should be done early and confident fixation effected Dr Wilson preferred living grafts fixed by vitallium screws The fibula was the best graft in cases of pseudarthrosis Often the fibula itself united after the graft from it had taken in the tibia This might be due to efficient immobilisation

Mr ALAN TODD (London) rebutted the argument against Lane's plates by pointing out that in the period quoted by Mr Dunn the no touch technique of Lane and Faggo was not being used Probably on account of jealousy, their successors refused to employ this method which had never been surpassed By 1934 these men had retired Mr Dunn should give the figures of the successes as well as the figures of non union Lane never plated compound fractures or cases of non-union except during a short period of the war He agreed with Hey Groves that excessive fixation was bad Steadying but not rigid fixation was better practice

Mr H O CLARKE (Manchester) asked Mr Stirling what was the best time for operation in a recent fracture Plating was not such an evil as Mr Dunn claimed In the Presbyterian Hospital, New York, by routine plating, they succeeded in returning their cases to work more quickly than we could In congenital pseudarthrosis of the tibia, grafts fixed by vitallium screws were his only successful cases

Mr SIR J D BUXTON (London) was not prepared to accept the view that the cause of non-union in fractures of the mid-shaft of the humerus was injury of the nutrient artery This was not the only factor, for delayed or non union did not follow ligature of the main vessel in an experimental fracture Grafts must be made firm, by whatever means, though he had discarded the use of metal He thought that the skeletal traction of a Thomas splint could cause non union

Mr STIRLING, in reply, said the best time for operation, after every conservative method had been tried, was about 10 days after the injury Then the collateral circulation was well established and embryonic tissue was proliferating Massive crystallisation was a condition which often occurred in fractures of the shaft of the femur, when in elevation in the presence of abundance of vitamins and minerals *union was not firm On lowering the limb to the bed* the fragments joined securely within 24 hours Mr NAUGHTON DUNN was not to be persuaded that there was any good in a Lane's plate He had never used one and had seen many disasters following their use by others

Open Fractures

Mr W C GISSANE (London) said he would describe his treatment of the open fractures occurring in a *large city, for the most part from road accidents* There were blessings to be counted in the conditions of injury The roads of a city were clean and often tarred, clothes were usually surgically clean—that is, they were free from pathogenic organisms, the instrument causing the injury was a shiny, petrol-driven vehicle, transport to hospital was speedy In this way three dangers were avoided delay, contamination from clothes, and contamination from the street dirt All clothing was submitted to aerobic and anaerobic culture A large number of non-virulent organisms was found In the last hundred cases only one showed gas gangrene and none tetanus The usual pathogenic organisms were those found on the skin The first step was excision of injured tissues, the living tissue left behind was able to cope with the remaining organisms The next step was administration of anti tetanus and anti gas-gangrene serum In a series of a hundred consecutive cases the sites of fractures were as follows tibia and fibula 43, skull, 11, radius and ulna, 7, phalanges 6, multiple long bones, 5, femur, 5,

mandible, 5, nasal bones, 5; ankle, 5; humerus, 3; metacarpals, metatarsals, pelvis, malar and superior maxilla together, 6. There were 82 males and 18 females: 76 cases occurred between the ages of 5 and 45 years. Cases came in after first-aid treatment had been applied and the fracture immobilised. Shock was present The first principle was to disturb the patient as little as possible. Shock was treated with rest, heat and a large dose of morphia. The patient was not washed, the splint was not interfered with and intravenous saline was not given. The wound was covered, the temporary splint was left intact and treatment begun within an hour. The main thing was to render the injury painless, for example by local anæsthetic. Before operation no washing or shaving was done, the skin was covered with spirit-soaked gauze and the wound uncovered. Mr. Gissane's faith in excision of wounded tissues and removal of dirt and tissue debris had superseded his faith in antiseptics. Leriche had said that the large-scale experiment of 1914–18 had demonstrated the failure of antiseptics. What was important was the vital quality of the tissues remaining. Often there was tearing of the skin and subcutaneous tissue to form a flap from the ankle to the popliteal space. It was best to sacrifice the flap and repair the area with immediate grafts. In ten such cases in a year, where previously amputation would have been performed, complete recovery had taken place Fractures into joints might occur or open fractures with deep wounds. In both such, the treatment was excision and washing out with gallons of isotonic saline. Bone must be treated more gently. Débridement was confined to gentle elevation and the minimum of manipulation. After reduction by apposition and traction the wound was closed by a split skin graft. After closure, traction was maintained, the wound was cleansed by surgical spirit and immobilisation was insured by plaster-of-paris and the double-transfixion-pin technique After débridement the soft tissues received blood but the return circulation was not completely established. Thus the tissues would not die on account of anæmia, but œdema always occurred. To prevent it, it was necessary to apply pressure This was most evenly done by a wool-and-paraffin dressing. The first plaster was kept on for 4 or 5 weeks if the temperature or pulse charts gave no indication for removing it. Then the plaster was changed and a closed healing fracture was usually present

Treatment was summarised in seven stages: shock; direct surgery without antiseptics; gentle reduction of the fracture; closure by skin graft or closely applied interrupted sutures, application of a soft paraffin dressing; immobilisation by plaster for 4 to 5 weeks; rest for 4 to 5 weeks

Mr. G. H. STEVENSON (Glasgow) said that in first-aid the first dressing should be very large. First-aid splinting was often well done but too localised. It was a good rule to immobilise the joint above and the joint below the injury. He often had to cope with the long delay after fracture caused by air-transport from the Hebrides. Unlike Mr Gissane he did not interfere with the usual washing and cleansing. He preferred a general anæsthetic to a local one, gas and oxygen or cyclopropane and oxygen for choice He had not found that the experimental results of spinal anæsthesia of O'Shaughnessy and Slome were always proved in practice He cleansed and shaved the skin, cleansed the wound with weak flavine or Dettol and then proceeded to débridement. He did not believe it was possible to excise the whole of the torn area. For closure of the wound he believed in Rutherford Morison's preparation "bipped silk," and the stitches should include skin and subcutaneous fascia only The Thomas splint as often as not was used for applying traction. A useful sling for the limb could be made by splitting the inner tube of a motor tyre lengthwise; the calf of the leg rested nicely in the curve of the tube. In multiple open fractures it might be better to sacrifice the limb rather than the life.

Mr. ZACHARY COPE (London) said asepsis was not always the best kind of surgery in open injuries. In cases which came from a distance, the type of wound must decide the type of surgery. In a bullet wound when penetration was from without inwards, the organisms present came from outside; antiseptics alone would then be of no use In a fracture, when penetration was from within outwards, no organisms would be present. Lister had shown that antiseptics were then of value in preventing infection. Débridement of course could be employed here to deal with the damaged tissue.

Mr. E. T. C MILLIGAN (London) said he was greatly encouraged by Mr. Gissane's fresh exposition of the excision technique. During the war spinal anæsthesia was prohibited for the treatment of shock. It was of most use in cases where much fluid had not been lost. The blood-pressure was then used as an index In those days, a pressure of under 120 was a contra-indication to spinal anæsthesia, but nowadays it was employed if the pressure was as low as 90. Most of the credit given either to asepsis or antisepsis was due to the excision of wounds carried out at the same time.

Mr. A. H. MCINDOE (London) said that coöperation between the surgeon and plastic-surgeon was to be desired, for not everyone could cut as large a graft as Mr. Gissane Special centres for grafting and other plastic operations would be necessary during an emergency.

Mr. R I. STIRLING (Edinburgh) said that the old method of débridement could be modified in severe wounds by swabbing with 1 per cent crystal-violet and brilliant-green. Devitalised tissue showed up black and healthy tissue blue and thus selective excision could be done.

Dr. P D. WILSON (New York) felt that there was always a danger in suturing compound wounds, for although culture in the first few hours might be sterile, organisms might develop later. He seldom had confidence to close them. The experience of surgeons engaged in the Spanish war and in China led them to favour Winnett Orr's method of treatment. This consisted of excision, application of a paraffin pack and immobilisation in plaster for a long period. Extension of military surgery must be founded on civil experience and he was sure that in an emergency we should be forced to leave wounds open. Traction splints were used by all the emergency services in America and therefore most of the fractures arrived in hospital in these splints, in much better condition than previously, and less shock was present

Mr. GISSANE, replying, said that he had a team three strong to deal with multiple fractures and they did pretty radical excision. He had had to rediscover the value of leaving viable tissue, and then had discarded the use of antiseptics Some antiseptics were actually injurious. Wounds to be skin-grafted could be left open after excision of devitalised skin, covered in plaster for 4 to 5 weeks, and then a skin graft was applied over the muscle after clearing away the granulations.

SECTIONS OF ANATOMY AND ANTHROPOLOGY

Prof. ALEXANDER LOW (Aberdeen) was in the chair when Prof H A HARRIS (Cambridge) opened a discussion on

Anatomy and Physical Training

During growth, he said, particular attention must be paid to the spine, whereas at any joint there is not only bone but also articular cartilage, epiphysial growth cartilage and calcified cartilage, here in addition there are the complex intervertebral disks with their own physical properties and rates of growth In man there is more growth in the lumbar region that in the cervical or thoracic spine, and in the lumbar region the disks are thickest and the spine most freely movable Mobility of the spine is a property of the disks, in which the nucleus pulposus, set in a fibrous shock absorbing ring, exercises a ball bearing function The main differences between the spines of men and quadrupeds are the overgrowths of the disks and lumbar spine (both vertebræ and disks) and the substitution of thin annular epiphyses for the truly "epiphysial" plates of other animals These washer like rings begin to ossify about puberty, so that then there is a change in the physical properties of the vertebral column At this age, therefore, the liability of injury to the disks is greater in severe bending exercises, such as touching the toes The rough-and tumble of ball games is therefore less dangerous than squad drill The frequency with which a disk is injured varies with its thickness Similar principles should be applied to the limbs Union of the epiphyses at the shoulder should alone determine the time at which heavy manual labour is started Disease and deformity are quite as liable to occur in the hip bone as in the head of the femur

It was folly to cast horoscopes on the basis of imaginary relations between physical development, mental development, temperament and susceptibility to particular diseases There was a low correlation between intelligence and physical efficiency While no two children progressed towards maturity at the same pace, yet natural forces had a way of reducing the differences to some extent as maturity was approached A distinction must be drawn between posture and attitude Posture is a nervous mechanism of ancient heritage, modified in man by the acquirement of stereoscopic vision, and dominated by the righting reflexes, which are physiological and developed at an early age Posture is automatic and involves the minimum of mental and physical fatigue Attitude, on the other hand, is a position of preparation for action and consequently places a considerable strain on the individual. Much of physical drill is directed towards the acquirement of an attitude rather than the maintenance of a pose In assessing posture it must be remembered that military smartness has no anatomical or physiological basis and that physical training is not regimentation It is impossible and unnecessary to make all children conform to a standard developmental pattern or a standard of physical performance in terms of age, whether that age is calculated by the calendar or by mental tests Above all, physical training should not attempt to interfere with the body build Food, play and free unorganised games in early childhood are the basis of healthy growth and physical training There is no index of physical fitness or efficiency save the ability to do one's job and live to a ripe old age The establishment of a false index will only produce inferiority complexes

Dr E SOLLY (Harrogate) opened the discussion which followed Prof D J WATERSTON (St Andrews) pointed out that though a man may carry out an action satisfactorily, still he may not do it in the best possible way, we should not lose sight of the fact that the best way can be taught. Many people, slouching about the streets, could do with a lesson in deportment

Prof R D LOCKHART (Aberdeen) questioned whether those responsible for physical training are so much in the dark about the dangers of regimentation and of certain exercises Muscles were very important, the tension of the hamstrings imposes restrictions on the combined movements of the hip- and knee joints, within any restriction imposed by the actual structure of the joints

Professor HARRIS, in reply, admitted the psychological effect of any form of training, but believed that the carriage of most people was satisfactory, and that slovenly dress must not be mistaken for bad posture There was a great discrepancy between physical build and physical prowess

Dr J K SLATER (Edinburgh) discussed the

FITNESS OF THE STUDENT

By a voluntary scheme, he said, all students at Edinburgh University could be medically examined, the numbers presenting themselves for examination and re examination had steadily increased as the students appreciated the benefits of the scheme It was very difficult to establish a standard when there was no specific object to be attained by that standard, in contradistinction to the insurance companies' standards of health Among the students he had divided posture into three grades, of which the third —bad—included all definite deformities On the whole posture was good, but there was a remarkable prevalence of flat feet It seemed probable that the likeliest way of establishing a life prognosis would be found in the investigation of the circulatory system

Professor HARRIS said he would like to see X ray examinations carried out on all students, and suggested that the incidence of pulmonary tuberculosis was very high in medical students The results should be followed up after the students had left the university Professor LOW and Mr G A G MITCHELL (Aberdeen) queried the prevalence of tuberculosis in medical students at Aberdeen

In reply Dr SLATER stated that the commonest causes of ill health among students were, in order, pulmonary tuberculosis, venereal disease, and gastric complaints A diploma of physical education was now given at Edinburgh and was open to all students

Professor LOCKHART showed a cinematograph film he had taken at the Bergman Österberg physical training college, Dartford A series of exercises was performed by an expert and a learner and the differences pointed out Special attention was drawn to one in which the arms were elevated without movement of the clavicle The trained student could achieve this, but not the learner, who could not allow her muscles to relax sufficiently

Prof A. Low then spoke on

GROWTH OF ABERDEEN INFANTS

At the Aberdeen Maternity Hospital, he said, 1000 infants had been examined and then re examined at the child welfare centre Of 50 male and 50 female children who were fit, normal, and full time, the boys at birth averaged in height 19·7 in and in weight 7·7 lb, while the girls were a fifth of an inch and a tenth of a pound less These heights were less

than the figures generally given, but the weights were five to six ounces greater than the published figures for other towns Re-examination showed that the girls grew slightly faster than the boys and that in two to three years the figures are comparable for both sexes; by five the girls were slightly taller. For both sexes the figures were now higher than those for the five-year-olds of Dundee and Edinburgh. The pre-school years were very important. The working-class mothers of Aberdeen had shown great intelligence and appreciation of the work. There was urgent need in this country of reliable observations on the growth of the child, as there was an entire absence of continuous figures on the development of individual children. We had no reliable British growth statistics

Professor HARRIS agreed about the serious gaps and considered the expenditure on school medical services unremunerative because of the loss at the two ends Records should also be kept of the development of teeth, and of defects in sight and hearing. We knew more of the continuity of development of a laboratory rat than of a human being.

Professor LOCKHART, who had taken the chair, said that he believed that this was the first time in any country that such figures had become available, and, in reply, Dr LOW remarked on the appearance of two developmental types, a precocious type which developed rapidly but by fits and starts, and a slower but more steady type These resulted in two kinds of infant face, one long, "like his father," the other chubbier, "like his mother."

REVIEWS AND NOTICES OF BOOKS

Fractures and Dislocations in General Practice

Lewis's General Practice Series. By JOHN B. HOSFORD, M.S. Lond., F.R.C.S., assistant surgeon to St. Bartholomew's Hospital. London: H. K. Lewis and Co. 1939. Pp. 274. 12*s.* 6*d.*

Experience in the Management of Fractures and Dislocations

By the Staff of the Fracture Service, Massachusetts General Hospital, Boston. General editor, PHILIP D. WILSON, clinical professor of orthopædic surgery, Columbia University. London: J. B. Lippincott Company. 1938. Pp. 1036. 65*s.*

A Manual of Fractures and Dislocations

By BARBARA BARTLETT STIMSON, A B, M.D., Med.Sc.D., F.A.C.S., associate in the College of Physicians and Surgeons, Columbia University, New York City. London: Henry Kimpton. 1939. Pp. 214. 12*s.* 6*d.*

BOOKS on the treatment of fractures follow one another so rapidly that one is left wondering whether most of them attain any but a purely local public. No branch of surgery in recent years has given rise to greater enthusiasm in those who practise it. At the present time many doctors are asking to be taught about the treatment of injuries who, until warnings of crisis and emergency disturbed them, had thought not to be drawn into traumatic surgery Mr. Hosford's should be an excellent textbook for them It is very well-balanced, containing detailed information about all the common fractures and dislocations but omitting descriptions of operations and rarer injuries which concern only the orthopædic specialist. The application of plaster splints has a chapter to itself, and it is probable that no better account can be read anywhere. The methods advocated for the various fractures are, of course, those used by the author. They are clearly set out and convincingly explained This is the first textbook, to our knowledge, which has described clearly the four methods of using the Thomas splint for continuous traction. Skeleton splints, rather than plaster-of-paris, are recommended for the treatment of compound fractures, until a stage when the wounds have either healed or shown evidence of obvious infection. For infected fractures, the Winnett Orr technique is described.

The volume produced by the surgeons of the Massachusetts General Hospital is primarily an account of their own experience in fracture treatment. It is a complete clinical and statistical account of 4390 fractures and dislocations, good results and bad being impartially related. At the end of each section on any type of injury, methods and results are criticised. Each section is written by a different surgeon, and as there are thirty-four sections in all, one cannot but be impressed by the wealth of surgical personnel which the fracture practice of the hospital commands. The book is very interesting to the specialist, but it is not of value to the seeker after first principles or solutions of individual problems It contains much useful and practical information, but surgeons as a rule do not like the statistical approach. Open treatment of compound fractures is advocated, by the Carrel-Dakin method. No case of gas-gangrene is recorded, although anti-gas-gangrene serum was not used at all. Dr. Charles Scudder makes a strong plea for more frequent use of open operative methods, especially in the case of long bones. In head injuries he says the tendency should be to operate less. The text is uneven in quality

Dr. Stimson's manual is intended for medical students. The correct and incorrect ways of taking the history of an injury are described, and throughout the text and the illustrations are designed to appeal to the beginner. The summary given of the points of importance in each fracture is an aid to memory, as is also the description of each injury under uniform headings—occurrence, displacement, diagnosis, pathology, treatment, period of immobilisation and prognosis. This is a less ambitious book than either of the other two, but useful for the reader who still has to face a qualifying examination. The illustrations are throughout line-drawings, which in most cases seem unnecessarily heavy and rather inelegant There is something in Mr. Hosford's contention that, since one has in practice to interpret not diagrams but original skiagrams, these are more suitable as illustrations for textbooks on fractures

A Textbook of Surgery

By American Authors. (2nd ed.) Edited by FREDERICK CHRISTOPHER, B.S, M.D., F.A.C.S., associate professor of surgery at Northwestern University medical school; chief surgeon, Evanston (Illinois) Hospital. London: W. B. Saunders Company. 1939. Pp. 1695. 42*s.*

IN this textbook of surgery collaboration has been brought to its highest pitch, in that 183 living and 4 dead authors have contributed to its pages Included in these are the best-known names in American surgery, and each subject is dealt with by an acknowledged master. The balance of the book however has been perfectly preserved, and its editor deserves the highest praise for the way in which proportion

has been maintained between the various subjects He has driven such a distinguished and no doubt high spirited team with the greatest skill The result is a *textbook which is authoritative, completely* up to date, and the result of observation and experience, rather than of quotation or impression

It is difficult to pick out the best in this book; perhaps the chapter on the nervous system, particularly the sections on tumours of the brain by Max M Peet and on head injuries by Carl Wheeler Rand, stands out Fractures are admirably dealt with, as are the various aspects of abdominal surgery In the genito-urinary section, prostatic enlargement receives poor attention, and while the American preference for perineal prostatectomy is mentioned, *no description of either this operation or of any of* the suprapubic operations, is given Chest surgery, orthopædics, gynæcology, and plastic surgery are all given ample space It is pleasant to find such a wealth of material in excellent print, with a minimum of small type There are 1381 illustrations, well produced and apposite, but it seems curious that the chapter on diagnostic and therapeutic radiology in surgery by James T Case should be without illustrations

Dr Christopher has proved that multiple collaboration need not lead to prolixity, his contributors have shown that the expert is the best person to summarise his subject, and the publishers have given most satisfactory form to a book which is bound to achieve widespread and well deserved popularity

---

Essential Nature and Organisation of Food Energy

By M BIRCHER-BENNER, M D London John Bale, Sons and Co 1939 Pp 80 5s

THE late Dr Bircher Benner made a considerable name for himself, even among orthodox physicians, by his dietetic treatment of various diseases, including tuberculosis, using uncooked fruits and vegetables exclusively The present book is an attempt to justify his principles by arguments from modern physics, modern biochemistry and the second law of thermodynamics, and the attempt seems hardly worth while The book might be reduced to the following statement uncooked and unaltered vegetable foods have more activated molecules than animal foods, these can emit quanta of energy which can be utilised by the animal eating them, cooking and passage through the tissues of animals reduces this available energy, therefore animal foods and cooked vegetable foods are less valuable in nutrition than raw and uncooked vegetable foods

The rest of the book contains little but dogmatic assertions, intricate assemblies of quotations from physicists from Carnot to Eddington and questionable deductions from these writers' works It will probably convince no one but the advocates of extreme vegetarianism, for it bears the stigmata of fanaticism The author himself writes —

"I foresee great *resistance and many refutations* to the new doctrine, which will be challenged also on account of *its novelty* To conceive food energy as systems of light quanta is revolutionary enough Still more unheard of is the conception of a specially schemed organisation of energy in every nutriment, which I termed food integral If I go so far as to assert that with food we introduce energy into our body corresponding to the body's structure which is adequately organised, or disorganised or transformed, some physiologists will immediately arise and explain that it is all nonsense, that in the process of resorption of food the digestive-fermentative action destroys the energy organisation."

The book will do little to remove or overcome *resistance to these doctrines* There are many mistranslations—quant and quants for quantum and quanta, catalyzators for catalysts, denaturalising for denaturing, and so on A far better monument to Dr Bircher-Benner's fame would be a collection of his case histories and methods of dietetic treatment, for his reputation can hardly have been raised upon such a sandy foundation as this book suggests

---

Lumley's Public Health

(11th ed) By ERSKINE SIMES, M A., barrister-at-law of the Inner Temple, CHARLES D SCHOLEFIELD, barrister-at-law of the Middle Temple, and A N C SHELLEY, M.A, B C L, barrister-at-law of Lincoln's Inn London Butterworth and Co, and Shaw and Sons 1939 To be published in 4 vols, £10 10s Vol II Pp 2011

OVER a century ago a speaker in the House of Lords complained that Parliament had been passing statutes by wagon loads and repealing them by cart loads If we think in terms of lorry loads today, the simile is confirmed by the monumental tomes of the new edition of Lumley's Public Health The recently issued second volume, even bulkier than the first, to which we paid tribute two years ago, contains the acts on food and drugs (consolidated in 1938), housing, town planning, restriction of ribbon development, superannuation of employees, and rating and valuation, not to mention the drainage of trade premises, hydrogen cyanide fumigation, physical training and recreation, the various midwives acts, and certain parts of the Factories Act of 1937 The editors hope soon to issue the fourth volume of the new "Lumley," which will contain the appendices, the third may be delayed and may appear in two parts They confess that the contents of this third volume are not yet settled Nor is this surprising They want their work to be comprehensive and complete They may well feel inclined to wait and see if the consolidating and amending Water Undertakings Bill receives the royal assent in the autumn And by that time it may be possible to guess the prospects of certain other legislation about health now just appearing above the horizon The subscribers to this colossal 16 guinea edition must have faith in the wisdom of the editors For the first time for thirty years the name of Sir Joshua Scholefield, K C, is absent from the title page of a volume of "Lumley" His former colleagues carry on competently the difficult task of expounding, annotating and collating the various branches of public health law

It is not merely the lorry loads of statutes that matter There are also trailer loads of statutory rules and orders behind them The interdependence of act and order is illustrated by the familiar section 6 of the Midwives Act of 1936 which prohibits unqualified persons from acting as maternity nurses for gain Parliament does not like legislating ahead of the facts It therefore enacted that this restriction should not take effect in any area until the Minister of Health was satisfied that the local authority has first provided an adequate domiciliary service of midwives there The volume under review gives us the text of the section and some appropriate notes thereon but does not seem to give the terms or substance of the orders whereby the Minister has pressed the button for the operation of the section in say, Birmingham or Somerset Perhaps this information is reserved for a future appendix Then again the

restriction in section 6 is not to apply to women certified by certain hospitals and other institutions to have been trained in obstetric nursing. The hospitals and institutions are those which the Minister names. A footnote by the editors refers to two orders, one of 1937 and another of 1938, whereby the Minister has specified certain hospitals and institutions But the book went to press presumably too soon to include a reference to a second order of 1938 to the like effect, not to mention the three subsequent orders of 1939. To single out so small a point in so vast a publication is not to criticise the editors' work so much as to exemplify its difficulties The new "Lumley" maintains the standard of its predecessors. No more need be said.

Diet and Ill-Health on the Gold Coast

Especially in its Forest Country. By F. M. PURCELL, M.D. Dubl., M.R.C.P.I., D.T.M., & H. Lond. London: H. K. Lewis and Co. 1939. Pp. 77. 7s. 6d.

THE author, a medical officer on the Gold Coast, having recognised the need for vision in dealing with ill health among the western Akim, has collected cases showing evidence of malnutrition. His book is divided into two sections. The first deals with the local dietary at Oda, the chief town, and in scattered villages in the forest areas, where the main industry is cocoa farming The second section describes cases of malnutrition and related diseases, mostly amongst the children of these communities Some tribes live on a staple diet of plantain, cocoyam and cassava, while those in the northern territories live mainly on millet and some meat On the coast, fish supplements the diet. The importance of nutritional œdema and skin disorders in the diagnosis of malnutrition is stressed, and cases are described showing many features of the pellagra syndrome. Reasons are given for thinking that *akwashiokar* is a form of infantile pellagra The interesting clinical material is well illustrated by numerous photographs. The author points out the difficulty of detecting subjective symptoms in primitive communities, for example the detection of impairment of vision among those who are illiterate. Such observations make his findings of value to those who deal with nutrition from a more academic standpoint The book is also of great importance for those who are faced with administrative problems of ill health on the Gold Coast, since excellent suggestions are given for improving the dietary; thus green leafy vegetables might be widely used, since these are within the limited means of these communities.

Abnormal Speech

By E. J. BOOME, M.B. Birm., M.R.C.P., D.P.H., principal assistant medical officer, London County Council; and H. M. S. BAINES and D. G. HARRIES, speech therapists for day centres and mental hospitals of the council. London: Methuen and Co. 1939. Pp. 162. 6s.

UNTIL recent years the importance of speech defect had been overlooked, but during and after the Great War it was shown that stammer could be produced by prolonged mental strain. Consequently speech defect as a symptom of similar strains in civilian life became widely recognised by physicians. It was then a short step for the educationists to realise that speech defect in children might be the result of similar nervous stresses, and that successful treatment of the stammering child, not only made it easier for the child to learn, but often resulted in the removal of other accompanying nervous symptoms There is now a rapidly growing speech-therapy organisation and several books on the results of this work have appeared in recent years. The volume under review is an interesting contribution to the subject and certain chapters can be specially commended, notably those on the difficult child, and the spoken word There is an amusing appendix, taken from an American official publication on "Data of Child Development" There are two slight defects in the book; the authors have attempted to put too much into a small volume, and it is a series of separate papers rather than a coördinated review of the whole subject This is a danger difficult to avoid when a number of writers have pooled their experiences The book is nevertheless interesting, not only for its contents, but also for its disclosure of the extent to which work under the London County Council has proceeded.

Aids to Dermatology and Venereal Disease

(2nd ed.) By ROBERT M. B. MACKENNA, M.D. Camb., M.R.C.P., hon. dermatologist, Royal Liverpool United Hospital. London: Baillière, Tindall and Cox. 1939. Pp. 284. 4s. 6d.

THIS little book is more than an aid to dermatology; it is a miniature reference book, more complete than most small handbooks on the subject All the common skin diseases are dealt with thoroughly and concisely and many rarer conditions are included Forty-four pages are devoted to a very adequate description of the venereal diseases and their treatment. Such recent advances as the use of M. & B. 693 for gonorrhœa and the complications arising from this drug are included in this section For its size the book is extremely readable, but of necessity there are no photographs. It can be strongly recommended to any practitioner who requires a small textbook on diseases of the skin.

Clinical Bacteriology

By F. A. KNOTT, M.D. Lond., M.R.C.P., D.P.H., director of the bacteriological department and lecturer in bacteriology, Guy's Hospital London J. and A. Churchill. 1939. Pp. 420. 12s. 6d.

IN this book an attempt has been made to present bacteriology in its application to clinical work Detailed descriptions of technique and cultural reactions of bacteria have, therefore, been cut down to a minimum. Nevertheless the clinical aspects are not more fully dealt with than in several other English textbooks of bacteriology, in spite of a short chapter on the management of infectious diseases and the mentioning of the clinical features of a few infections in the appropriate chapters. The presentation of the facts is simple, although in places the writing is rather confused as in the sections on the structure of antigens and the rate of antibody production. In two tables (pp 200 and 260) the data are at variance with the text. The statements on pp. 133 and 152 referring to the fermentation of inulin by bacteria of the streptococcus pneumococcus group are contradictory. *Clostridium chauvoei* is wrongly credited with the ætiological rôle in lamb dysentery and the author states that tularæmia is met with only in America whereas its occurrence in Asia and in several countries in Europe is well recognised. Most of the illustrations are adequate, a few, such as fig 20, are not particularly instructive and might well have been omitted.

THE LANCET

LONDON SATURDAY, AUGUST 19, 1939

FRACTURES A SPECIALTY

THE steady spread of specialisation in surgery is often deplored as a necessary evil necessary because the advancement of science has made surgery far too big a subject to be mastered by one man, evil because it limits the variety in a surgeon's work and sometimes warps his perspective To the patient, however, the word "specialist" signifies something not evil but good, and there is no doubt that specialisation in surgery almost always improves the patient's lot, which, after all, is what matters most The rival arguments have been revived by the appearance last week of the report on rehabilitation after fractures, which we summarise on p 446

Should fractures be treated by the general surgeon in the general wards and outpatient department, or should they be segregated and treated from start to finish in a special department by an expert controlling a team of trained assistants? From the point of view of the injured man there is no question which alternative is the better Under the old system any person sustaining a fracture serious enough for inpatient treatment is admitted under the surgeon who happens to be on duty at the time This surgeon may have no special interest in fractures and will probably not see the case until a day or two later The immediate treatment is probably undertaken by a registrar or house-surgeon and the patient then remains in the ward for a few weeks surrounded by the sick and perhaps the dying During this time the visiting surgeon sees him and maybe makes some suggestions for modifying the treatment In due course the man is discharged, probably to the massage department, where his treatment is taken up by someone who has never seen him before and who is entirely dependent on the house-surgeon's notes for information Finally, when the patient is considered cured he is discharged, and may then have a further period of waiting until he starts work again There are very obvious defects in such a system Yet nobody will say that this account is unfair to the average general hospital

Conditions are very different in a special fracture clinic The patient receives his first treatment either at the hands of the experienced surgeon in charge or of an assistant trained in fracture technique During his stay in the ward he remains constantly under the same expert supervision He is surrounded by healthy men in various stages of recovery and the atmosphere is one of optimism and the will to recover When he becomes an outpatient he remains under the supervision of the same surgeon, who by now knows him and his injury pretty well, and his progress to full functional recovery is uninterrupted In due course he may start light work, but he is still under the supervision of the surgeon in charge of the clinic until he is back again at full work Centralisation and continuity of control are the essentials of such a system and the secret of its effectiveness Its success in practice is no less certain than its advantage in theory Those who have seen BÖHLER'S clinic in Vienna will none of them doubt that this is the general system under which fractures should be treated, even though they may disagree with details of his method Though it is hard to imagine BÖHLER'S clinic without BÖHLER, his enthusiasm, his energy, and his personal interest in every patient at every stage of his progress should be characteristic of the surgeon in charge of any fracture clinic We may not go all the way with W H OGILVIE in saying that "personal care and enthusiasm count for more than actual technique in the treatment of fractures," but we must admit that personal care and enthusiasm are essentials in the chief of a fracture clinic—in addition to surgical ability and experience. If such a man is to give so much of his time and energy and abilities, what is to be his reward? On the present system of honorary appointments at voluntary hospitals his financial reward is less than nothing Not only is his appointment honorary, but the amount of time he must spend at it will greatly reduce his opportunities for remunerative work elsewhere Some modification of this system is obviously necessary and the interdepartmental committee favours the giving of a substantial honorarium to the surgeon in charge of a fracture service

Unfortunately specialisation in the treatment of fractures will affect others besides the patient and the surgeon who specialises In the first place the remaining general surgeons will be deprived of the profit and interest of treating fracture cases But this has been the criticism every time a move has been made to divert one of the streams of surgery into the channel of the specialist, and it can only be said that if the specialist shows that he is able to do the job better than the general surgeon, then he should be allowed to do it The student's point of view must also be considered, and on the whole he will benefit In a few attendances he will see a great number and variety of cases at all stages of treatment and he will have the advantage of watching an expert treat fractures the theoretical teaching will also presumably be better But he will probably be burdened with an addition to his curriculum, for he must still do his six months' general surgical dressing, and he may find too that the expert team will not be able to offer him a place, so that he will not be able to "get his fingers into the business" which is such an important part of surgical training and will have to be content with watching This at any rate has been the result of specialisation in some other departments of surgery

Finally one may consider whether a fracture service might be extended to include other allied

conditions. The orthopædic department is the obvious next-of-kin to the fracture service, and the two have much in common. In several English cities the surgeon in charge of the fracture service of a hospital is one of the orthopædic surgeons, and the arrangement seems to work fairly well. A rather different question is whether a fracture service should be extended to include all other types of injury and become a general traumatic service. Some conditions such as lacerations, sprains, and all injuries of the limbs are certainly suited to treatment in a fracture service, but others are obviously not suitable—for example, injuries of the head and abdomen which are obviously best treated by specialists in cranial and abdominal surgery. These lesser problems however will solve themselves once the major question is decided, Should specialised fracture services be established? We believe the answer is, emphatically; Yes.

NEUROSIS OR PSYCHOSIS?

Professor RYLE's Croonian lectures, concluded in our present issue, remind us very forcibly of the close interrelation between mental disorder and bodily dysfunction. The psychiatrist is at times apt to forget the physiological consequences of emotion. On the other hand, the general physician tends inevitably to think in terms of the somatic manifestations of minor mental upsets. In the busy consulting-room there is seldom enough time to build up a complete picture of the mental life behind the spastic colon. If the physiologically minded physician can join hands with the psychiatrist we may hope to arrive at a balanced understanding of the visceral neuroses. Meanwhile, psychiatrists find themselves in a position of increasing complexity. As they examine the mental changes of their less severely ill patients, they are continually faced with the question of the difference between a neurosis and a psychosis.

Like socialism and malnutrition, neurosis is easy to talk about but hard to define. We can recognise only too well our neurotic patients and we can as a rule tell when we meet the legally *insane*. But the psychotic patient does not necessarily hear voices or see visions and the conduct of the neurotic may well cast doubts on his sanity. YELLOWLEES[1] puts the case for one school of thought clearly and concisely.

> "Neurotics, generally speaking, are made, not born. I believe it to be far otherwise with the psychoses, the causes of which are more deeply and mysteriously biological. Psychotics are born, not made."

Clinically YELLOWLEES says that the essential difference is the insight into the illness or lack of insight: "In spite of all kinds of exceptions, qualifications and modifications, I know of no better, and indeed of no other, means to judge whether we are dealing with a psychosis or a neurosis, than to apply this test of insight." In other words, the neurosis is a product of environment and the psychosis of heredity; the neurotic retains his insight and his touch with reality, while the psychotic does not

But, on the basis of careful clinical observation of the so-called borderline cases, there is growing up another school of thought. This school finds that in the causation of the neuroses and the psychoses both heredity and environment play their part; the hysteric often has an abnormally psychopathic family history, while the gross endogenous depression may be precipitated by a family or business misfortune. Further, they say that the advanced hysteric is completely lacking in insight, while the early schizophrenic often has enough insight to realise the bizarre stupidity of his symptoms and to seek relief for them. The conclusions of this school have lately been stated thus by SYMONDS[2]:—

> "The distinction between a minor mental disorder (a neurosis) and a major mental disorder (a psychosis) is one of convenience. All the primary mental disorders are 'functional' nervous disorders, being without known pathology, or specific ætiology. At one end of the scale, however, there are patients whose mental disorder is of a degree which might cause them to be regarded as insane by conventional standards—for example those of a Justice of the Peace. It is convenient to have a separate medical term for these patients and they are called psychotic, all other degrees of mental disorder being neurotic There are certain types of mental disorder which very rarely become psychotic—for example hysteria. The schizophrenic patient on the other hand often becomes psychotic at quite an early stage of the illness. Between these extremes lies the affective type of mental disorder which may be either of the neurotic degree (anxiety neurosis, neurotic depression) or the psychotic degree (manic-depressive psychosis).
>
> ". . . There is in my view no essential difference between a neurosis and a psychosis except that of degree. This is opposed to the opinion at one time widely held that a neurosis and a psychosis were two quite different diseases and of different ætiology, an opinion largely founded on the belief that all neuroses could be accounted for in terms of psychological conflict or motivation."

At once a difficulty presents itself. If the term psychosis be reserved for the legally insane, while neurosis covers the rest of mental illness, the early schizophrenic, as quoted by SYMONDS, is not psychotic but neurotic, while the rare but occasional certified hysteric is not neurotic but psychotic. Such reasoning leads inevitably to the conclusion of MAPOTHER and LEWIS[3]: "The distinction between neurosis and psychosis is at times convenient, but without substance." This does not mean that hysteria, the anxiety state, and the obsessional state are not definite diagnoses. It simply means that, although they do not as a rule require institutional treatment, they differ essentially from schizophrenia, paranoia and mania only as these differ from one another and not, say, as diseases of the skin differ from those of the liver

To state dogmatically that either of these schools is correct would be premature. If the conception of the neuroses and the psychoses as two essential varieties of mental disorder is to die, it will probably die hard. While the battle rages perhaps the safest place is the fence.

CHILDREN AT THE PICTURES

NEARLY five million children in this country go to the cinema as a habit once a week, and many thousands go more often. "Children in the Cinema,"[1] by RICHARD FORD, is therefore very welcome. Its findings are so objectively set out and its conclusions so free from bias that they deserve the consideration of all concerned with the healthy development of children. That the cinema influences the child's habits of speech nobody can seriously doubt who has heard a six-year-old patient reply "O K chief" to a request to put out his tongue. Does the film similarly influence behaviour? A speaker at the conference of the central women's advisory committee of the Conservative party, on May 11, 1938, is thus reported: "We all know that there is a very great increase in juvenile crime. It is the considered opinion of those who know that this is very largely due to the effect of unsuitable films upon children." A magistrate, presiding over a juvenile court where a charge of shop-breaking was brought against three boys, said, "These lads go to the pictures and see dare devil things, and they are imitating them. I have never been to the pictures in my life, although I am over seventy." On the other hand, at the child-welfare committee of the League of Nations the British representative said that the conclusion they had come to at the Home Office was that there was very little crime deliberately due to what the child had seen at the cinema. And the HOME SECRETARY expressed himself thus in the House of Commons: "Our inquiries go to show that today the young are not more wicked than they were, but that they are less controlled by their parents. It is not so much films and shilling shockers that make juvenile crime, but broken homes, indulgent mothers, unkind stepmothers and unemployment." Child psychiatrists apparently agree with the Home Secretary. Dr EMANUEL MILLER, speaking at a conference on films for children in 1936, said, "The films no more produce criminals than the amorality of our dreams induces us to commit crimes. I have not known a single young delinquent, of more than 100 I have studied, who was deeply influenced by films of crime. They may act the gangster, but they do not follow his career!" Prof. CYRIL BURT, in his book "The Young Delinquent," writes of cases in which the opening of a cinema had reduced hooliganism among boys, withdrawn young men from the public house, and supplied girls with a safer substitute for lounging with their friends in the alleys or the park.

It seems that the usual reaction of the juvenile audience to a film is to identify itself with the sympathetic character, usually the hero or heroine. In one of the most popular types of film, the "Western" serial, the children identify themselves with the cowboy hero: they are not in the least shocked or horrified by the innumerable sudden deaths that occur provided their hero escapes unscathed. Right triumphs over wrong, and right can always be identified in the dustiest mêlée by his big white hat. This process of self-identification explains, too, the success of the child star. In slapstick comedy the child appears to play the part purely of a spectator, though usually a highly appreciative one. Of the cartoon films, the purely comic variety, including most of the adventures of Mickey Mouse and Donald Duck, are extremely popular. But some of the more fantastic Disney cartoons, in which grotesque animals and bogy men take part, are really terrifying. Mr FORD reports that 923 elementary-school children in Birkenhead were asked whether the pictures ever frightened them, and the replies were: no, 465; yes, 148; sometimes, 208. Most authorities consider that fear in a children's audience is highly undesirable, and this was given official recognition by the censors' introduction of the Horrific category—"H" films. It is difficult to foresee what is likely to frighten young children. They appear to demand a stable order of things and any threat to this order is violently resented. Broadly speaking, one may say that, if the film contains a character with which the child identifies himself, any gruesome or painful thing happening to this character will cause distress. This must not be confused with the excitement and even creeping of the flesh, which is usually entirely pleasurable, occasioned by the thrills of the "Western" serials and the gangsters. In the grotesque Disney cartoons, and in films with villainous characters, a close-up, or worse still an ugly face gradually enlarged to give the illusion of approaching the spectator, will produce the silence of real fear. Indeed this gradual enlargement of objects is the essential feature of many nightmares. The supernatural is also apparently acutely unpleasant to the child; of 1439 children studied by the Birmingham Cinema Enquiry Committee,[2] 350 admitted that their sleep was disturbed by fear or bad dreams. It is interesting, but not surprising, to find all observers agreed on the harmlessness to child audiences of prurient or erotically suggestive passages. Love, and those substitutes which the cinema is so prone to portray, are considered by children as incomprehensible and profoundly boring. Only to the adolescent and the ill educated adult are they possibly depraving.

Efforts are now being made to select, from the general commercial output of the film industry, films suitable for children, and to show these films at special performances. But on the constructive side of making special films for children, whether for entertainment or education, the industry has not made much progress. Many of the difficulties have been financial, but public ignorance and apathy are the real hindrances to progress. The medical and teaching professions are generally unaware of the very important place which the films are taking as a formative influence on the ordinary child's mind. The direction of this influence into channels of a higher cultural value is a matter of importance and urgency.

ANNOTATIONS

THE PREVENTION OF FIBROIDS

ON p. 420 Professor Lipschütz and Dr. Vargas record experiments supplementing those they described in our issue of June 10. They then showed that fibromyomas of the uterus can be produced in castrated guineapigs by the continued administration of œstrogenic hormones. In commenting on their findings we expressed the view that the appearance of these tumours might be prevented by the simultaneous administration of hormones known to be physiological antagonists to œstrogens, such as the luteal hormone of the ovary (progesterone), or the thyrotrophic hormone of the anterior pituitary. This possibility has been recognised also by Lipschütz and Vargas, and the results reported in their present paper fulfil the prediction as regards progesterone The new observations explain why fibroids can be induced with œstrin more easily and regularly in the castrated animal than in the intact one They also give further support to the view that fibroids in human beings arise through a disturbance of endocrine balance—a conception in accordance with the clinical features of the disease in women A rational treatment based on this conception, making use of either progesterone or the thyrotrophic hormone, appears therefore a possibility, and one which might now be justifiably explored by clinicians called upon to treat small *fibroids*.

This work raises too a question of general pathological interest—can uterine fibromyomas still be classed with the true tumours? Hitherto they have been regarded as benign tumours, but true tumours, whether benign or malignant, have the property of autonomous growth—i.e., they continue to grow when the stimulus that has led to their appearance is withdrawn. Experimentally these uterine fibromyomas regress when administration of œstrogenic hormone ceases, and this absence of autonomous growth constitutes a difference which justifies their separation, as non-neoplastic tumours, from the true benign neoplasms It is possible that further investigation of the causation of other types of tumours now believed to be benign neoplasms may add other examples to this group of non-neoplastic tumours The importance of drawing such a distinction, if it exists, need not be emphasised Not only is it of theoretical interest but it is bound to influence treatment.

THYROTOXICOSIS, INFECTION AND THE HEART

MANY workers believe that the streptococcus has something to do with rheumatic fever, but that there is another undiscovered ætiological factor which operates in conjunction with it Some have sought this missing link among the filtrable viruses, others in an altered functional state of the tissues of the rheumatic patient There is evidence in support of a hereditary abnormality, possibly in the form of an altered serological response to streptococcal infection. The suggestion that vitamin-C lack prepares the soil so that rheumatic fever is produced by streptococcal infection is out of favour now, but the work on which this hypothesis was based did at least point the way to the experimental study of myocardial damage. Now interest is turning towards endocrines. Schultz [1] finds that repeated injections of adrenaline produce minor lesions in the hearts of guineapigs, but that streptococcal infection does not intensify the damage. Infection is important in causing non purulent myocarditis in animals treated with insulin or thyroxine. The results with thyroxine are particularly interesting because of the tendency for Graves's disease and rheumatic fever to occur in the same individual However the changes in the animals' hearts did not resemble at all closely those seen in rheumatic fever. The serous myocarditis and myocardial fibrosis which were produced were like the lesions seen in exophthalmic goitre, and suggest that infection occurring in this disease may cause permanent damage to the heart. The way these experiments worked is obscure. Studies with endocrines, dinitrophenol, vitamin C, and ultraviolet irradiation suggest that increased metabolic rate and cardiac overwork are not alone responsible. Thyroxine caused a slight increase in the rate of antibody formation but the relationship between this and carditis was uncertain.

"DORMANT" LEAD POISONING

THE Manchester inquest on a painter, reported in our columns last week under the heading "Lead lying dormant?" ended in the jury returning a verdict of accidental death due to the man's occupation. While it is a valuable function of the coroner's court to draw attention to the dangers connected with industrial employment, the 1936 report of the departmental committee on coroners deprecated the tendentious verdict which may seem to trespass into the field of civil liability and, in cases where the application of the Workmen's Compensation Act may ultimately be an issue, to anticipate the decision and to interfere with the jurisdiction of the county court judge by whom that particular issue will be tried. The verdict of the coroner's jury is in no way binding upon the county court.

Whatever the appropriate tribunal, the parties possibly concerned with the aspects of civil liability may be left to seek decision there It may perhaps be permissible to add, without particular reference to the facts of the Manchester case and certainly without any intention to prejudge any litigation some general observations on lead poisoning This form of industrial disease has in the past been accused of causing various conditions now known to have no connexion with it—illnesses ranging from disseminated sclerosis and paralysis agitans to general paralysis of the insane and lymphocytic meningitis In any investigation of causes, special attention must be devoted both to the clinical picture and to the occupational history. Possible sources such as drinking-water will naturally not be neglected The available material would include the methods and habits peculiar to the patient—points perhaps unknown to a workman's employers. Suppose, for instance, that a post-mortem examination of a middle-aged workman reveals no lesions other than a terminal bronchopneumonia but discloses comparatively large quantities of lead in the liver, kidneys and brain, although evidence at the inquest negatives any history of exposure to lead for many years past With the indications of a high circulating lead, what would be the likelihood that lead absorbed many years ago could have been mobilised in sufficient quantity to cause lead encephalopathy? On the one hand Aub and his co-workers showed, many years ago, that lead could be drawn into the circulation from the bones by influencing the direction of calcium flow.

1 Schultz, M. P., *Publ Hlth Rep., Wash* July 7, 1939, p 1205

On the other hand, it is now believed that this mobilisable lead is stored in the bone trabeculæ, and that, when absorption ceases, part of it slowly passes to the blood, from which it is excreted, and part passes to the hard bone where it is much less easily affected by changes in the body fluids Toxic episodes can be precipitated by various means for a short period after absorption, but is there any evidence that lead can be mobilised in sufficient quantities to cause characteristic symptoms after a lapse of many years? Will those concerned with industrial lead poisoning support the interpretation Dr Gordon Ward places on the facts he reports in our correspondence columns this week?

THE RHEUMATIC NODULE

RHEUMATIC subcutaneous nodules were described early in the nineteenth century, were studied microscopically over fifty years ago, and are still the subject of mild controversy Meynet in 1875 thought them extremely rare, whereas Cheadle in 1889 found them common in children Coburn in 1931 recorded them in 11 per cent of his patients,[1] while Wilson,[2] observing cases in the same city over a longer period, found them in as many as a third Their specificity is not often questioned, but the nodules of rheumatoid arthritis resemble them clinically, and the microscopical appearances are similar, although Collins[3] thinks them not identical Carey Coombs in 1924 wrote that the subcutaneous node was the most rheumatic of the rheumatic phenomena, but admitted seeing it in subacute rheumatoid arthritis and in a case of chronic ulcerative carditis (However, coincidence of the cardiac lesions of bacterial endocarditis and Aschoff's nodes has been demonstrated many times, and Coombs's patient may have had both diseases) Carpenter in 1901 reported nodules in infants with no other sign of rheumatism, but if rheumatoid arthritis is excluded it is fairly safe to regard typical nodules as diagnostic of rheumatic fever, and the old working rule that they signify cardiac involvement and a severe infection is just Cheadle regarded "the eruption of large nodules as almost equivalent to a sentence of death," and Coombs believed the "most serious omen as a form of onset is the subcutaneous node" Wilson[2] studied 20 rheumatic patients who were under regular observation in the first three decades of life and noted that 5 of them had nodules, none at the onset Of 20 who died in this period, 8 had nodules, 2 of them at the onset So nodules do not make the prognosis hopeless

The experimental side is controversial too Passing over the production of nodules in the rabbit by intravenous inoculation with the micrococci of Poynton and Payne in 1913 and in the guinea-pig by a combination of vitamin deficiency and streptococcal infection[4] we have to consider the claims of Massell, Mote and Jones[5] to have produced nodules in man They injected procaine and some of the patient's blood into the subcutaneous tissues over the olecranon process, and made each patient rub his injected elbow on the bed for several minutes, six times a day, for ten days The experiments were well controlled, and 18 out of 20 children with clinical rheumatism developed nodules The third item of our new contemporary *Annals of the Rheumatic Diseases* contains an article by F Dudley Hart[6] describing similar experiments, with completely negative results The only differences between the methods were that Hart used no procaine, and friction was applied with the patient's hand "several times a day," and may not have been vigorously applied We know of another experimenter who injected blood distal to the olecranon process, and told the child to rub the elbow on the bed, a moment's trial makes it clear that friction is thus applied over the proximal aspect of the olecranon process, and nodules subsequently appeared there, not where the blood was injected The common sites for the natural formation of nodules are where a bony surface is exposed to the small irritation of the bed clothes, and it is hard to think that friction or pressure is not a major factor

Whatever may be the cause of the discrepant findings, we must await further investigation—in the faint hope that the differences will be resolved, but with a sanguine expectation of further disagreement

THE YEARBOOK OF THE LEARNED WORLD

THIS invaluable publication, comprising the sections of Minerva[7] concerned with the universities and technical high schools of the world, contains particulars of the staffs of all the seats of learning from Cambridge to Calcutta and from Simferopol to Santiago Its completeness reflects the greatest credit on Dr Gerhard Lüdtke, its editor, and on Dr Friedrich Richter, his assistant To both and to the publisher the learned world owes an ever increasing debt

URETERIC TRANSPLANTATION INTO THE INTESTINE

ANASTOMOSIS between the ureters and the large bowel is carried out in cases of congenital malformation of the bladder and as a preliminary to removal of the bladder for malignant disease In view of the severity of the operation of total cystectomy it is most desirable that any method of deviating the urinary flow that precedes it should be simple, and for this reason there is much to be said for transplanting the ureters into the loin Unfortunately, however, as Mr Henry Wade[8] pointed out in his Honyman Gillespie lecture, no apparatus has yet been devised that will keep a patient dry whether standing, sitting and lying, so that in spite of the low mortality, this operation has rightly been discarded The risk of fatal ascending infection when the ureters were transplanted directly into the bowel was appalling, but this has been largely overcome since Coffey introduced his [illegible] method of anastomosis In [illegible] uses transplantation into the [illegible] has always carried out the [illegible] but Wade, employing a [illegible] transplants both ureters [illegible] details in his procedure [illegible] catheters to keep the [illegible] administers continuously [illegible] sulphate for the first [illegible] the urinary flow, and [illegible]

rectum to ensure the free escape of urine Wade has carried out this operation in 54 cases, and in his more recent series has had only 1 death in 11 patients operated on for non-malignant conditions and 6 deaths out of 14 patients with carcinoma of the bladder. The operative risk of this procedure is therefore not prohibitive.

The second standard method of uretero-intestinal anastomosis is transplantation into the rectum, which was first carried out by Simon in 1851, and one type of which is described by Prof Shilovtzeff on p. 412. In Shilovtzeff's series the operative mortality was high, for he had 5 deaths in his 19 non-malignant cases. As he says, however, ectopia, which was the condition present in 12 of these, is itself highly fatal, and he maintains that his operation presents few technical difficulties even in infants. Coffey's technique and its modifications have the disadvantage of being elaborate, and any simplification that does not entail greater risk is of value. The transplantation of both ureters at one operation, advocated by both Wade and Shilovtzeff, is also much to be desired, since separate transplantation in a case of carcinoma of the bladder may mean four operations—an exploration, two operations for transplantation, and a cystectomy. There are few patients who will tolerate such an ordeal.

OSLER UP TO DATE

OF the many writings of Sir William Osler, perhaps none has had so wide an appeal to all sorts and conditions of men as Aequanimitas [1] Published in 1904 it has been republished many times since, and now thirty-five years since it first appeared it still has its message Reading again these pages it is easy to understand the reason for this continued esteem Almost every line is the credo of the most distinguished clinical teacher of his day, expressed in language which is not only full of literary and philosophical allusion, but is itself a notable example of the best English prose tradition. In one address he lays emphasis on the international unity and concord of the medical profession. In these days of political upheaval Osler would at least have had the consolation of finding that medical friendships and international medical interchange have endured in spite of differing state ideologies. No-one who is seeking to join, or already belongs to, the medical profession can find a more inspiring leader Sir Walter Langdon-Brown contributes a brief and sympathetic note recording the impression which Osler made on those whose privilege it was to know him.

If Aequanimitas gives us an insight into the mind of the master as he himself wished it to be remembered, his bibliography,[2] laboriously compiled by Dr. Maude Abbott, shows him in a somewhat different light. He was a prolific and highly skilled journalist. He had an unerring eye for good copy, and tireless energy in putting it into shape He was essentially a transmitter and a sublimator of knowledge rather than a pioneer in untilled fields. His output of writings, speeches, and discussions was enormous, and we are filled with admiration for the skill and completeness with which Dr. Abbott has presented the results of her toil. The arrangement of such varied material is obviously important, and she has divided it under seven chief heads—natural science; pathology, comparative and human; clinical medicine; literary, historical and biographical; medical education; public welfare; and editorial. The longer sections are subdivided into the four main periods of Osler's life: at McGill, at Philadelphia, at Baltimore and at Oxford There is an excellent index, so that it needs no long search to discover any subject on which Osler made observation or reflection

Dr. Abbott prefaces her work with three admirable quotations, one from Osler himself, one from John Ferguson's Bibliotheca Chemica, which Osler quoted in the transactions of the Bibliographical Society, and the third from Sir Humphry Rolleston's Osler memorial lecture: "So wide were his contributions that any writer, especially if with a new idea, observation, or historical subject, would be well advised to find out before publication what Osler may have said" This volume makes the condition easy of attainment and all students of medicine and literature will be grateful to Dr Abbott.

SPITTING

EXPECTORATION is so commonplace that its physiological significance and mechanism have been neglected It should be a subject of special interest to workers in one of the new clinical research departments, as most of our knowledge has in the past been collected by clinicians. Just over ten years ago Cecil Wall [1] dealt fully with the musculoskeletal mechanism of expectoration. He described how, by raising intrapulmonary pressure and then suddenly allowing the air to escape, any peccant matter that might be lying in the air-passages was carried away. About the same time interest was revived in ciliary movement and its part in removing secretions. It was nearly a century since Sharpey [2] had shown that cilia worked together to move a sheet of mucus in a constant direction. For many years nothing further was added to this knowledge, until Leonard Hill [3] demonstrated that secretion and foreign particles are carried by the cilia to the larynx comparatively quickly, and that they work best in a neutral medium with the mucous membrane evenly stretched As might be expected, the rate of motion is accelerated in the horizontal position when the influence of gravity is removed. Hilding [4] pointed out that the secretion in the nose and accessory sinuses is carried backwards by the cilia into the nasopharynx, a finding which was confirmed by Lucas and Douglas [5] These workers went on to show [6] that neurogenic impulses in the bronchi and trachea affect the rate of secretion but not the rate of motion of the cilia Thus the rate of evacuation of secretion (that is, the efficiency of ciliary propulsion) is a function of its consistency

A mass of evidence therefore proves that throughout the bronchial tree a sheet of mucus is steadily being moved by ciliary action towards the larynx from the periphery In addition, another sheet of secretion is being pushed towards the larynx from the upper air-passages by a similar method Nasopharyngeal secretions are normally swallowed, but, though not expectoration in the literal sense, they may be hawked or coughed up in disease Muscular action

assists the progress of these two sheets of mucus The thoracic movements described by Wall act as a gross method of propulsion, but there are, in addition, finer movements of expansion and contraction of the bronchi[7] occurring at each phase of the respiratory act A bronchoconstrictor reflex also facilitates the expulsion of secretion The most violent movement of expectoration is the cough which is reflexly excited when secretion in excess of normal reaches certain areas of the bronchial tree These sensitive areas are chiefly the carina and larynx, but also to a lesser degree the larger bronchi and trachea Chevalier Jackson has said that 'the cough reflex is the watch dog of the lungs," and certainly it is the most dramatic method of evacuation of unwanted material

Thus secretion is removed from the lungs by a combination of four methods, and H C Ballon[8] has recently reviewed the mechanism He also describes experiments which show that foreign bodies or secretion can be coughed out of a lung even when the diaphragm on that side is paralysed Maxwell Ellis[9] had previously demonstrated that any change in capacity of the thoracic cage is synchronously accompanied by a change in the calibre of the bronchi, and that a lung can empty itself of secretion even in the presence of a pneumothorax As a corollary, Ballon states that healthy lung is protected against secretions emptied into it from diseased pulmonary tissue by an increase in tone of its bronchial tubes There is again experimental evidence to show that variations in bronchial tone occur not only as a result of stimuli but also in an apparently quiescent animal[7] Pharyngeal movements assist the cilia of the upper respiratory tract in the propulsion of secretion, and, when secretion is excessive or irritant, the larynx is excited to produce the cough reflex This occasionally gives rise to an erroneous diagnosis of pulmonary disease, for instance "haemoptysis" is often a manifestation, and sometimes the only one, of epistaxis Further inquiry into this complicated and important bodily function is certain to produce results of great interest as well as of clinical value

INDIA GOING DRY

It is perhaps chiefly for emotional and religious reasons that Congress has adopted the prohibition of alcohol as a plank in its programme Nine Indian provinces have now introduced prohibition in limited areas, and each has had to face considerable financial losses from excise revenue and the cost of preventing smuggling and illicit distilling On Aug 1 Bombay city went dry The estimated drink bill was formerly 3 million pounds a year, of which half went to the government in excise The drink trade was in the hands of the Parsees and the first day of prohibition was marred by riots between Hindus celebrating the end of an abuse and Parsee agitators protesting against the new property tax which is intended to bridge the deficit in the revenues Eight hundred volunteer prohibition guards among them students, doctors and lawyers, are helping to enforce the law, and 20,000 members of various physical and cultural organisations have also offered their services

Bombay is introducing prohibition in an urban area, whereas other provinces have preferred to start in rural parts For over a year the Madras government have been enforcing prohibition in a rural area centring around the town of Salem Prof P J Thomas, an economist at Madras University, regards the initial results as extremely encouraging[1] Formerly the average annual drink bill among certain classes of Salem workers was 132*s*, of the 2,500,000 total population not more than 200,000 took drink, but the liquor sales of the district exceeded an annual average of £2 a head The first effect of prohibition on manual workers was apparently loss of energy and zest for hard work, aches and pains increased and absenteeism was common Later, however, attendances rose from 63 per cent to 91 per cent and a monthly bonus of 3*s* for regular attendance, previously earned by 10 per cent of the workers, was earned by 75 per cent Output also increased All classes of workers consumed more vegetables, milk, ghee (melted butter) and curds When Thomas wrote his report the cinemas in Salem had increased from four to six and their daily takings from £15 to £38 Expenditure on shoes, umbrellas, soaps and clothing had nearly doubled, and debt repayment had improved

At the same time it would be unwise to say as yet that prohibition has proved itself in India The large majority of Indians have been for many years total abstainers, and an open hostility to alcoholic beverages has almost confined intemperance to the lowest strata of society It is arguable that the intemperate addict who has defied the deeply rooted age long prejudice of the majority will not find solace in passively diverting his income to socially desirable expenditures He may still waste his substance on gambling, ganja, opium, and other narcotics

---

Air Vice Marshal Sir ALBERT RICHARDSON director of medical services at the Air Ministry, has been promoted to the rank of Air Marshal

The seventh International Congress on Rheumatism will be held at New York, Philadelphia, and Boston from June 1 to 10, 1940 Further information may be had from the Ligue Internationale Contre Le Rhumatisme, Keizersgracht 489, Amsterdam, Holland

The death is reported from Moscow of Prof M B KROL, director of the clinic for nervous disorders at the All Union Institute of Experimental Medicine Born in 1879, Prof Krol was chief physician at the Kremlin Hospital from 1934 to 1938 and in 1935 he headed the Soviet delegation to the second International Neurological Congress in London

PUBLIC-SCHOOL AND SECONDARY-SCHOOL BOYS

A COMPARISON OF THEIR PHYSIQUE

BY H. BATHURST NORMAN, D.M. Oxfd, M R C.P.

IT is important to define standards of physical development which may be expected when the environment is optimum Spence (1935) has emphasised the value of a knowledge of normal—i e, optimum—standards of physique: "The time is ripe for a re-examination of standards of physique and growth and if necessary for the formulation of new standards which represent what are desirable and attainable levels of physical growth for the people of this country . . . it should be possible to know what stature may be hoped for in people if they are brought up under ideal nutritive conditions" Gray and Jacomb (1921) have compared certain of the current physical standards with actual observations of 136 healthy private-school boys from wealthy American homes in order to determine which of these standards is most suitable for use in connexion with this particular class Their conclusion is that for judging the size and weight of children of the highest economic class totally new standards are necessary.

The years of adolescence are a critical period from the nutritive standpoint. A time of rapid growth is associated with the physical and emotional adjustments of puberty and educational tests or long hours of unaccustomed work have to be faced for the first time. But the state of nutrition at this period has been less fully investigated than amongst children of school age, and in particular there is a lack of standards based on recorded measurements of groups of adolescents whose home environment, health record and heritage present a favourable combination.

The material of the present investigation comprises 1001 adolescent males between the ages of thirteen and eighteen years Of these, 500 are public-school boys drawn from that 10 per cent. of the population which is comprised in the nutritional group VI of Sir John Orr (1936) In this group alone the standard requirements of the various nutritive elements for the maintenance of perfect health are exceeded in every instance. The remainder are a homogeneous group of secondary-school boys in the county of Durham. The following measurements are recorded for each group: (1) height; (2) weight; (3) sitting height; (4) lumbar pull, measured by the dynamometer; (5) chest girth on expiration and inspiration.

At the public school I was fortunate enough to have the assistance of a science master who had had previous experience of biometric work with boys. In Durham Dr. George Wilson, deputy director of education for the county, most kindly helped with the measurements

The age-groups are taken from the last and not from the nearest birthday. Thus under the heading "15" are included boys between their fifteenth and sixteenth birthdays The other ages are similarly treated While it was recognised that the use of the metric system has many advantages in recording measurements, it was thought wise to follow the usual practice of workers in this country and give records in English weights and measures.

Care was taken in the supervision of the actual measuring to ensure that the figures from the two groups were strictly comparable The work was carried out by a single investigator assisted in each case by a worker of experience, and every effort was made to maintain "that continual *animus mensurandi*, absence of bias and the correctness of scales" demanded by the British Association committee of 1883.

The object of the inquiry was not merely to study the physique of two groups of different economic standing but rather to indicate adolescent physical standards to be found where conditions of environment and nutrition are optimum. The second series of measurements representing an average sample of adolescent physique as found in secondary schools is included to allow a comparison to be made between the two groups It is hoped that this may be of interest in the light of recent reports which have shown that the diet of those attending secondary schools compares unfavourably with that of public school boys.

For the purpose of this comparison simple observations which are recognised as throwing some light on nutrition have been made and are analysed statistically Physical measurements have been shown to give an index at least as satisfactory as a careful clinical examination; and it is probable that, in the present state of knowledge, as much reliable information about differences in the average state of nutrition of groups of children can be obtained by taking simple measurements as by any other means

WEIGHT

The weight was recorded to the nearest quarter of a pound. For strict accuracy the clothing should be removed and the bladder and bowels if possible be emptied before recording the weight The circumstances of the inquiry made this impossible, and weights were taken in shirt and trousers with coats, pull-overs, waistcoats and shoes removed. In measuring the public-school boys, the same weighing machine was used throughout. In Durham the boys were drawn from schools in Stockton-on-Tees, Durham City, Bishop Auckland and Spennymoor and it was necessary to use different machines for recording the weights The accuracy of these machines was in each instance tested before use

The annual increase in weight of the individual child is generally regarded as of great significance Friend (1935), speaking from his experience at Christ's Hospital, says: "The more experience one has of weighing as a routine, the more is one convinced that it is one of the most important clinical aids at the disposal of the school medical officer." A record of mean weights of groups of adolescents, though of less definite significance, is of real value as evidence of nutritional progress

The weight of clothing worn at the time of weighing was estimated by taking the actual weight of the clothes in a number of cases The weight was found to range from 3 to 5 lb. according to the size of the boy, representing approximately 3 per cent of the total recorded weight The field work was done during the spring and early summer of 1937, and although the measurements for the Durham boys were taken somewhat later in the year there did not appear to be any important difference in the weight of clothing worn by the two groups The weights recorded are the gross weights inclusive of clothing The numbers included in the age-groups thirteen to fourteen and nineteen to twenty are not sufficiently

large to give information of value In the other age-groups there are considerable differences in favour of the public-school boy, who in each instance averages more than a stone heavier than the secondary-school boy (table I).

HEIGHT

The height was measured in socks, and the measurements were recorded to the nearest quarter of an inch Growth in height is generally regarded as being less quickly affected by under-nutrition than growth in weight. Table II shows the comparative heights of the public-school and secondary-school groups Here again there are significant differences at each age in favour of the former. The relationship of weight to height (W/H) has been used in the past for the assessment of physique. The value of this ratio gives little more information than do the two original measurements. Ordinarily good nutrition causes height to outstrip weight, so that the well-nourished child while both taller and heavier than the poorly nourished is at the same time lighter in relation to its height. It is therefore interesting to notice that in the present series of measurements the public-school boy is shown to be not only taller but also heavier in relation to his height than the secondary-school boy.

SITTING HEIGHT

In the measurement of the sitting heights Dreyer's method was followed (Dreyer and Hanson 1920). The subject is seated on a level board with the backs of his hands on the platform on which he sits, the fingers pointing backwards The knees are flexed, the lowest part of the sacrum being in contact with the measuring standard and the weight being taken by the ischial tuberosities. The measurement taken is that between the tuberosities and the top of the head This method avoids the introduction of errors which may arise from the contraction or relaxation of the posterior muscles of the thigh. The sitting height is recorded in order to discriminate between torso and true leg length.

Leg length is usually found to be greater where the environment is more favourable Where nutrition is defective the limb growth is delayed more than that of the trunk, and when the environment is improved there is a marked increase in the standing height. The available studies suggest that faulty conditions of environment have a close relationship to lack of growth of the lower extremities In table III the mean sitting height is given for the two groups These figures show less marked differences between the public-school and secondary-school boys and in the case of the two older age-periods the differences are of borderline significance. A comparison with the figures of the mean total height show a relatively increased length of leg in the public-school boy

PULL

The instrument used for the measurement of pull was the spring-balance dynamometer designed by Magee for work with school-children The strength of the lumbar pull is measured, and it is suggested that the muscles involved in this—those of the thigh, gluteal regions and trunk—are less likely to be specifically developed in some individuals than the muscles concerned, for example, in the hand grip. The instrument has an adjustable handle and the level of the upper border of the patella has been found the most suitable position after extensive trials Inconstant readings are obtained if the handle is not kept approximately at this level The pull is made with the subject standing directly over the handle, the feet resting on the base of the instrument, one on either side of the dial. The knees are kept straight but not rigid. This technique was followed in the present inquiry. Two pulls were made by each subject. It was explained that a maximum effort should be made and the figure recorded was the greater of the two pulls. A brief rest interval of approximately half a minute was allowed between the two efforts. Cathcart and his colleagues (1935), who used the dynamometer for investigating the physique of men and women in industry, have recorded experiments made in the laboratory to determine the effect of applying tests of grip and pull in rapid succession with no appreciable rest intervals, and in other series with intervals of 30 sec., 1 min. and longer. He concluded that the resting allowance could be reduced to 30 sec. or less without detrimental results Table IV shows the lumbar pulls of the two groups Magee (1935) records tests made with 100 public-school boys between the ages of twelve and a half and sixteen and a half in which the relation of the pull (P) to weight (W) was found to be 2 36, the variations being within 10 per cent. The figures of the present series show a somewhat lower value for this ratio

CHEST GIRTH

The chest girth was measured in both full inspiration and in expiration The most accurate figure for the chest girth is probably obtained by taking the average of the circumference on forced inspiration and expiration. There has been no uniform system of measurements in the past, the girth being taken at different levels and many workers preferring to use the resting chest girth which gives a somewhat different figure.

Physical training is important in considering the question of chest girth. In schools where this is in force measurements are likely to be increased At the public school under review there was at the time of this inquiry no system of physical training, while at the secondary schools some form of physical training was the rule. On the other hand opportunities for athletic exercises were much more plentiful for the public-school group. It was found that boys who had had chest measurements taken before and were practised performers were better able to empty the chest completely and the resulting measurements were better than in the case of boys who had had no previous experience of such measurements The method adopted was to take the measurements at the level of the ensiform cartilage, the subject standing in an upright position with the measuring tape in contact with the skin. Measurements were taken with the chest fully expanded and after forced expiration Table V gives the mean chest expansion at each age and it will be noticed that there is little difference between the public-school and the secondary-school boys.

DISCUSSION

The foregoing figures show well-marked differences between the physique of the two groups The physical development of the individual is determined by a number of diverse factors of heredity and circumstance. These are extremely complex and it is not possible to define with accuracy the influence exerted individually by diet, disease, constitution and environment.

The incidence of disease will fall most heavily on those whose economic circumstances are least good. The acute infections of childhood and chronic

septic infections of the mouth and nasopharynx may produce a permanent impairment of nutrition and the poorly nourished child of low vitality remains peculiarly liable to disease Poorer housing conditions, fewer opportunities for athletic exercise, excessive fatigue and inadequate hours of sleep may prejudice growth in the secondary school group Lack of knowledge of the principles of hygiene and of sound nutrition are prevalent to some extent in all classes of the community The character of the housewife has been shown to have a direct bearing on the height and weight of children In many households where purchasing power is adequate the income is often unwisely spent from the strict standpoint of nutrition Such ignorance is more prevalent in those sections of the community where it is likely to prove most damaging

Heredity is an important influence in the determination of stature If heights of adults and of children in any class of society are taken, it is found that in general tall parents have tall children But the assumption that differences in stature between the various economic classes are due to hereditary factors is not altogether justified. American observers have noted the remarkably improved physique of the children of Japanese, Russian and Italian immigrants into the United States, the children often being several inches taller than their parents During the last twenty years it has been found that there are a large number of dietary factors, a deficiency of which leads to stunted growth It is recognised that the diet of those in good economic circumstances is rich in these factors, while the diet of the poorer classes is in many cases so deficient that we would expect to find growth limited by the inadequate supply People on the same kind of diet tend to have the same stature, and the real correlation is often one of diet rather than of inherited genes In all cases the final limits of growth are set by heredity How nearly such limits are approached depends on a variety of environmental conditions of which correct nutrition during the growing period is one of the most important Thus short stature in the higher economic groups is in most cases inherited, while in the poorer classes, where dietetic deficiencies are known to exist, the inherited potentialities of growth are not fully realised Attention has been specially focused on the so called "protective" foods which are particularly rich in important minerals and vitamins Such are whole cereal grains, milk and milk products, eggs, fish, fresh vegetables and fruit The inclusion of such foods in diets previously deficient in them has been shown to produce a definite acceleration of growth accompanied by a general improvement in physical well being The children are more alert, and there is improvement in the colour of the skin, the general vitality and efficiency in athletic exercises

CONCLUSION

An attempt has been made to present as simply as possible a series of physical measurements of public school boys whose nutrition is unusually good It is suggested that these measurements may be accepted as standards for good physique for boys of similar age and race Another series of measurements taken under comparable conditions relates to secondary school boys whose physique would be considered satisfactory according to accepted standards There are significant differences At each year between the ages of fourteen and eighteen a boy of the first group is approximately 16 lb heavier and 3 in taller than a boy of the second group His lumbar pull is 30 lb greater The difference noted in height is shown to be chiefly a difference in the length of leg A record of the ratio of weight to height shows a greater weight per unit of height in the public-school group The figures suggest that the differences in physique are roughly maintained throughout the age period under review, there is no progressive deterioration on the part of the secondary school boy, nor is there any obvious tendency in the higher ages to approximate to the stature of the public school boy.

When failure in development is associated with defective nutrition the delay in growth is often made good by accelerated growth towards the end of the growing period There is no suggestion of any abnormal acceleration of growth in either group in the present study, the figures show that growth is well maintained at each age in both groups

It is not necessarily advantageous to accelerate the normal rate of growth An actual imbalance of growth is not uncommon at puberty, excessive growth in stature putting an undue strain on the limited energy resources of the adolescent and thereby curtailing development in other directions Visceral growth and cardiac reserves may temporarily lag behind skeletal development and it may be necessary to limit physical activity Height and weight are not themselves desirable objectives nor do they necessarily betoken good health When however growth is accompanied by obvious increase in well being and greater bodily and mental vigour, it is good evidence of an improvement in nutritional status

It is probable that the differences recorded in stature during adolescence are not equally marked in adult life Where nutrition is good early maturity in size and physique is the rule The period of growth is longer in the case of boys in less favourable circumstances and there is likely to be some approximation in stature after the age of eighteen due to the later maturity of the secondary school group It is emphasised that the differences in the physical development of the two groups as reflected in the present data correspond to differences known to exist in their diets, and it is suggested that a relative deficiency in food factors responsible for satisfactory growth has been instrumental in bringing about these differences

" The keys to the successful organisation of science are freedom and democracy Nowadays freedom for individual research means more than the absence of prohibition or even of compulsion, it implies the provision of adequate material and help Thus the limitation of subsidies and organisation for science is probably the most effective way to stifle discovery, for discovery and fruitful application can no longer be counted on to come of themselves, they need intelligent provision The consciousness of a common aim binds people together far better than any autocratic ordering But the present organisation of science is not free and democratic, it is still in form authoritarian and hierarchical, and any new organisation must base itself far more on voluntary association and on the executive power of councils of all grades of workers "—J D BERNAL, J R S, *New Statesman and Nation*, Aug 5, 1939, p 211

FRACTURES

THE ORGANISATION OF TREATMENT

More than a million and a quarter injuries are treated each year in the hospitals of Great Britain, and of these about 200,000 are fractures. Although there is no means of estimating the cost to the community of these accidents, it must run into many millions of pounds. In 1937, for example, the cost of compensation under the Workmen's Compensation Acts was estimated at about £13,000,000: and only about a third of all fractures are due to industrial accidents.

Though prevention is preferable, rapid and complete cure will minimise the loss suffered by the injured man and less directly by the community. It is here that surgery must take responsibility Unfortunately the treatment of fractures is often inefficient and recovery is slow and incomplete. No-one would deny this and a remedy must be found.

The final report of the Interdepartmental Committee for the Rehabilitation of Persons Injured by Accidents [1] is an interesting and valuable document. Although the terms of reference of their inquiry include all kinds of injuries, the committee have in the main concentrated on the treatment of fractures. At the same time they think that once an efficient fracture service has been established it will naturally attract to itself many allied conditions such as severe lacerations and sprains and injuries of the hand and fingers It should exclude, on the other hand, injuries to the head and abdomen, for these are better treated by specialists in cranial and abdominal surgery: the committee are opposed to a comprehensive traumatic service.

FRACTURE SERVICES

By far the most important recommendation in the report is that special fracture services (or clinics) should be set up throughout the country and that they should be based on three principles:

(1) All fractures (except those of the head) should be segregated in a single department, which would provide for both inpatients and outpatients.

(2) The service should be operated and controlled by a single team under a surgeon in charge.

(3) The treatment should be continued until the fullest possible restoration of working capacity has been attained.

The accommodation required is discussed in detail and plans are given of two recently erected fracture clinics. The items include a "shock room" for the immediate treatment of seriously injured cases, an X-ray department with a portable apparatus, a department for physiotherapy and remedial exercises, and an efficient system of records

The personnel centres in the surgeon in charge, and if the clinic is established at a voluntary hospital he should preferably be a member of the visiting staff with a special interest and experience in the treatment of fractures. It is suggested that he should receive a fairly substantial honorarium (say £500 a year in a hospital of over 500 beds) for the special and onerous duties he would undertake. The amount of time he would have to give to the fracture service would considerably reduce his opportunities for more remunerative work and some compensation would be essential if the best man is to be obtained He would be permanent and he would personally control and supervise every stage of the patient's treatment, thus ensuring the coördination and continuity which are essential in an efficient fracture service Under him would be one or two whole-time assistants of the standing of registrars, besides resident house-surgeons There would be close coöperation between the fracture service and the orthopædic department.

RESTORATION OF FUNCTION AND HEALTH

Treatment should continue until the fullest possible functional recovery has been attained. The importance of the early stages of treatment, the accurate reduction and immobilisation of the fracture, is not underrated in the report, but it is the next stage, the restoration of function, that is considered in most detail, for it is in this stage that the present system of treating fractures is held to be most seriously defective. Although physiotherapy, such as massage and electrical treatment, may play a valuable part, active movements of the muscles and joints are of greatest importance and are best carried out under supervision in some kind of gymnasium.

There are several reasons why these remedial exercises should be done at the clinic In the first place they can be supervised, which is the only way to ensure their being done properly. Secondly, the example of other patients and competition with them are useful stimuli. And thirdly, the patient is away from his home, where conditions are often depressing and the cause of anxiety and discouragement. He should be made to consider his efforts towards recovery as a whole-time job, and should spend as much time at the clinic as possible Later may come the question of light work A job created merely to keep the man occupied is not good enough Too often light work exercises every member except the injured one. The surgeon in charge should satisfy himself that the work is of the kind the man requires to complete his recovery and should see him from time to time at the clinic until he can do full work. In some cases when a man's work is heavy he may need a course of general reconditioning, even though the function of the injured limb has returned to normal. Such cases should be few if efficient treatment has been given at a clinic with adequate facilities, but when they do arise it is suggested that the physical-fitness centres which are being established under the National Fitness Campaign might meet their requirements. The London Midland and Scottish Railway already have at Crewe an establishment which does excellent work of this sort Every effort should be made to abolish the dangerous interval sometimes intervening between the patient's discharge from treatment and his resumption of full work For those cases where permanent disability incapacitates a man from following his old occupation, a vocational training centre might be established by the Ministry of Labour to train him for some other work

The report also deals with the psychological factors influencing recovery from the effects of an accident The fracture service can have little direct control over some of these, but there is general agreement that the efficient treatment of the patient in an organised fracture department will go a long way to prevent some of these abnormal mental states arising A lot can be done by suggestion, through the surgeon in chief and his assistants, that complete recovery is to be expected as a matter of course, and in a successful clinic the high proportion of rapid and complete

1 London: H M Stationery Office 1939 Pp 194 3s 6d

recoveries will speak for itself Financial worries and the anxieties and difficulties connected with compensation are often a cause of emotional mischief, and although they are fully and sympathetically discussed in the report no final solution is suggested As a royal commission has been appointed to consider the whole question of workmen's compensation the committee make only one recommendation in this connexion—namely, that a man should continue to receive compensation as for total incapacity so long as he is under treatment at the fracture service unless he has been found suitable light work and is earning wages

Some of the troubles that beset an injured man and may retard his recovery can be mitigated by the good offices of an almoner's department for instance, the home conditions can be inquired into and distress relieved by drawing on some appropriate fund, extra nourishment for the patient or his family may be provided where it is found to be needed, and if he cannot afford his fares to and from the clinic help may be found The almoner may also do very useful work as an intermediary between a man and his employer, by helping to solve such problems as the securing of suitable light work, or perhaps by obtaining an assurance that work will be found on recovery

WHAT SHOULD BE DONE NOW

The committee recommend that steps be taken now to establish fracture services in all parts of the country Schemes should be worked out in consultation between the local hospital authority (i e, county or county borough council) and the representatives of the voluntary general hospitals, and it is strongly recommended that a standing joint committee of the two bodies should be set up for this purpose Other interests, such as the local bodies representing the medical profession and the organisations of employers and workers, should also be consulted Where a full fracture service cannot be established at once it is recommended that temporary provisional arrangements be made which secure the main principles of a fracture service The important thing is to get started

Capital expenditure will sooner or later be necessary in the institution of fracture services, and the report suggests that this should be met by the benefactions of public spirited individuals and general public support To help to meet the cost of maintenance it is proposed that the local authority should make an annual subvention In addition the limits imposed by the Road Traffic Act on the amounts that may be recovered by a hospital for treatment of road accident cases should be abolished, and also the approved societies might make a larger contribution by way of additional benefits, to hospitals that establish adequate fracture services

Their inquiry convinced the committee that the training of medical students in the treatment of fractures is, in general seriously deficient and that a period of training in the fracture department should be made an obligatory part of the curriculum Various suggestions were considered for applying this recommendation one or two of the six months set aside for inpatient surgical dressing might be devoted to attending the fracture and orthopædic departments, or, if it was considered undesirable to shorten the period of general surgical dressing then the course on fracture training would have to be fitted in elsewhere The fracture departments would also provide excellent facilities for postgraduate study and refresher courses

UNITED STATES OF AMERICA

(FROM OUR OWN CORRESPONDENT)

VOLUNTARY HEALTH INSURANCE

From July 20 to 22 representatives of associations which provide medical care on a prepayment plan met in New York Among these associations were groups described by Dr Hugh Cabot as "producer-coöperatives" (such as the Ross Loos clinic in Los Angeles and the Trinity hospital group at Little Rock, Arkansas) and "consumer-coöperatives" (such as the group health association of the home owners' loan corporation in Washington, D C) The numerous industrial medical organisations were not represented This was the first meeting of all the voluntary health insurance experimenters The difficulties of organising for group practice under existing state laws, and the opposition of organised medicine to this type of experiment, were discussed General applause greeted Dr I Goldman of Yale when he stated that while abuses do exist under all insurance systems, including those of England, France and Germany, the danger of abuses had been greatly exaggerated and could be met by proper organisation When turnover was discussed, the group health association in Washington described how there are regularly 25 members each month transferred from the government service or from the city of Washington Dr Michael Shadid of the farmers union coöperative hospital association, Elk City, Oklahoma, said that in his experience there was no turnover, since the hospital at Elk City is owned by the farmers of Oklahoma, who are fully conscious that the interests of the coöperative are their own

An encouraging feature of this conference was the presence of speakers who considered simply the ideal of good medical practice Prof John P Peters described forcibly the ever increasing acceleration of the potentialities of medicine combined with the poor record of these potentialities being realised "The medical profession," he said, "congratulates the system of individual competitive practice for the high estate of medical science in this country In actual fact the practitioner is playing an ever-diminishing rôle on the productive side of medicine The new diagnostic and therapeutic procedures which he employs and the apparatus which he operates emanate more and more from full time salaried workers in educational institutions research organisations or commercial firms Often enough the inventors have not even a medical degree The physician is being relegated to the position of distributor and technician" He warned his hearers that medical groups must not develop on department-store or repair shop principles, if this happened, their doctors would sink to the level of clerks and technicians Groups must be organised so as to attract men with high intelligence and education, and offer them opportunity for continuous intellectual development The group clinics had an opportunity both to provide exemplary medical care and to give the staff opportunities for educational growth

The organisation of an ideal medical group was also discussed by Dr Hugh Cabot, until recently of the Mayo Clinic The most essential member was the man who was called in America an "internist" Dr Cabot felt that if there was an internist there must also be an externist, and so the most satisfactory thing was to reclassify the internist a "good general physician" This man should add up the observations of all the specialists and consider them as a whole Whether

or not all patients should be shown to the specialist depended upon the kind of specialist employed It was a waste of time to let the expert with a microscopic mind review all cases Every group should include experts in the special senses, in surgery, and in dermatology and roentgenology. Good medical care must be based upon preventive medicine They were still making faces at syphilis and not doing so much more satisfactorily than they were twenty years ago. Good medical care must enable the sick to have at their disposal the whole machinery of modern medicine. It was improbable that more than 10 per cent. did get care of this kind. Good medical care could not be got as long as doctors' incomes depended upon providing it. There were three fields of knowledge involved in group medicine: sociology, economics and the scientific practice of medicine. Capable representatives in these three fields must be consulted For forty years Dr. Cabot had insisted upon a yearly report from each of his students. They had asked him, "Where is this practice of medicine you told us about?" Their elders who were under oath to look after them saw to it that the young man got no chance to work. They needed the services of youth with its energy and idealism, and they would not get good medicine as long as the emphasis was on age, experience and whiskers

At the concluding session it was agreed to form a national association which will hold its first regular meeting in Chicago next year.

SCOTLAND

(FROM OUR OWN CORRESPONDENT)

THE SCOTTISH CHILD'S INTELLIGENCE

A STUDY of child intelligence in Scotland has been occupying the Scottish Council for Research in Education for the last two years, and their report has just been issued. Three groups were studied: the first from the four major cities, the second from the industrial belt, and in the third from predominantly rural districts On the Binet tests the mean intelligence quotient for the total sample of children was 100 11. Boys showed a mean quotient of 100 51 and girls 99·7, a difference which is not regarded as statistically significant. A slightly lower level was found in the children of the industrial districts compared with those of the urban and rural groups The average level in rural children is not inferior to that of the city children. It is felt that the remarkable uniformity of educational opportunity which has been achieved in Scotland must have had an influence on the development of intelligence in areas where environmental conditions might otherwise tend to create a lower intelligence level Performance tests were also studied and here again the lowest mean level of ability was found in the industrial belt, but on these tests the city children were found superior to the rural children. A definite sex difference on the performance tests was apparently due to a slower rate of development of ability in girls than in boys Equal results were obtained at the age of 8 or 9 years but thereafter boys became increasingly superior.

INCAPACITY AMONG SCOTTISH INSURED POPULATION

Miss Muriel Ritson, controller of insurance and pensions, stated last week that there were over 26,000,000 days of incapacitating sickness from June, 1937, to June, 1938, in the insured population of Scotland. This figure was slightly lower than that of the previous year, but it was for a year in which no influenza epidemic occurred. Of the lost days 11½ million were accounted for by 31,000 men and women who were sick throughout the year. It was known that the main causes of long-term disablement were diseases of the nervous system, bronchitis, valvular disease of the heart, rheumatism and tuberculosis. Scotland had a long and honourable record of measures for combating disease and raising the standard of health, but so long as there remained such a mass of chronic and disabling disease among the living they must not rest satisfied. In the prevention of long-term illness greater stress must be laid on the factors concerned in building a healthy body rather than in patching it up when ill health appeared Social workers could not but wonder how the stress and strain of the present anxious times would affect the health of the peoples of Europe. It would be a bold prophet who would forecast the results of this so-called "war of nerves."

DENMARK

(FROM AN OCCASIONAL CORRESPONDENT)

GASTRIC AND DUODENAL ULCERATION

DURING the last few years perhaps the two subjects most prominent in Danish medicine have been pneumonia and gastric and duodenal ulceration Pneumonia has attracted attention because of serotherapy and chemotherapy, and gastric and duodenal ulceration because of the recent remarkable changes in the frequency and sex distribution. The interest taken in this subject in Copenhagen has spread to the provinces, and in the town of Aarhus Dr. A. Guldager and Dr. F. Heintzelmann have reviewed the incidence of manifest ulcer hæmorrhages in the 20-year period 1918–37 To make their comb-out as complete as possible they scrutinised the records of the municipal hospital A study of 341 cases of manifest ulcer hæmorrhage shows a striking increase in the condition This seems to be exclusively due to the greater tendency of males to develop gastric and duodenal ulceration, with hæmorrhages. During the period studied the increase in admissions to the medical wards of this hospital was proportional to the increase in the town's population in the same period, whereas the number of patients suffering from ulcer hæmorrhages was more than quadrupled. At the beginning of the same period men and women were equally liable to ulcer hæmorrhages, whereas at the end the ratio was four to six men for every woman This sex discrimination most unfavourable to the male is still unexplained.

SERUM TREATMENT OF PNEUMONIA

For those who, like the Danes, have thrown themselves heart and soul into the campaign for serum treatment of pneumonia, there is something tantalising and almost exasperating in the diversion created by chemotherapy. The possibility that Prontosil may be a red herring or an ally rather than a competitor of serum treatment is comforting the workers at the Danish state serum institute There since 1935 Dr. T. Madsen, its director, has created a special department for examining sputum, typing pneumococci, producing serum, and researching into the serology of pneumonia This work is obviously important, since the average case-mortality from pneumonia in Denmark has for some years been about 20 per cent. and during the 15 years

ending 1936 there have been about 10,000 deaths in Denmark from croupous pneumonia alone, irrespective of bronchopneumonia

The pneumococcal rabbit serum issued by the state serum institute and now in general use in Denmark has been found to be quite as effective as horse serum, and a dose of 200,000 units now costs only about Kr 40, whereas the price for the same quantity used to be about Kr 350 The concentration of the serum has been increased so that now there are 4000 to 6000 units in every c cm The serum is in most cases given intravenously rather than intramuscularly The results, as shown by a recent study of Dr N I Nissen, have been quite encouraging His material has consisted of 932 cases of pneumonia in which serum was given The *mortality of 13 5 per cent* might well have been reduced for window-dressing purposes had he allowed himself the luxury of weeding out several fatal cases in which the serum treatment was not given a fair trial

FATE OF LUPUS PATIENTS

Dr C N S Gundtoft has inquired into the causes of death of patients who had attended the skin department of the Finsen Institute in Copenhagen during the past 25 years He collected information about 211 such cases His findings suggest that the patient who suffers from lupus vulgaris runs little chance of dying of this disease, but he has a fifty-fifty chance of dying of some form of tuberculosis The deaths ascribed to lupus itself numbered only 10 But there were as many as 61 patients who had died of pulmonary tuberculosis, and 33 who had died of some other form of tuberculosis, such as tuberculous meningitis As for the non tuberculous causes of death, malignant disease was the most important, being responsible for 24 deaths This is in itself a testimony to the benign character of the lupus which allowed its victims to attain a high enough age to become subject to malignant disease Pointing in the same direction were the 8 cases in which the cause of death was said to be *senile decay* Dr *Gundtoft* draws attention to the great frequency with which pulmonary tuberculosis broke out shortly after treatment of lupus was started, he suggests that in these cases the lupus had been the cutaneous manifestation of an already serious though still latent pulmonary tuberculosis The late Dr Reyn, formerly chief of the Finsen Institute, was among the first to emphasise the importance of a tuberculosis background in the lungs and elsewhere of patients who at first sight seemed to be suffering from lupus and nothing else

FROM DOCTOR DON

III

EVERY time I revisit London I rejoice that I no longer live there Somewhere about 100,000 appears to be the maximum size to which a town can grow and remain a coördinated social organism Beyond that level its membership becomes as irrational and irresponsible as a swarm of locusts or lemmings When people are condemned to live in Hoxton or Clerkenwell or one of those amorphous areas around Wembley or Penge, it is almost impossible for them to feel local patriotism or to take an active part in the life of the community The women's institutes have developed so vigorously in the villages that they have become a power in the land, but the health centres and community centres in the towns languish and seem unable to stand by themselves The picture palace the billiard-room and the by pass road are poor substitutes for the parish pump and the village hall and largely in consequence Hog's Norton is months ahead of London or Birmingham in A R P Dwellers in the Harley Wimpole Street area develop a sentimental attachment to St Marylebone but I lived there for five years without knowing the names of the mayor the town clerk or any of the borough council, and I am sure this experience is not unique

In medicine London has become the great *Wasserkopf* with hundreds of consultants and thousands of consultoids I have always deplored and fought against this over centralisation, though it is probable that the specialist must follow the crowd as the salmon follows the herring shoal It is a bad thing that the *Wasserkopf* should dominate clinical education as it does by historical prestige, weight of numbers and proximity to the Royal Colleges Few teaching physicians in London have many friends outside their own profession and fewer still work actively alongside scientists, humanists or industrialists The state of affairs is quite different in places like Aberdeen, Edinburgh or Oxford In Aberdeen, for example, with the Rowett Institute and the fishing industry looming so large, it is natural that clinical teaching should be permeated with the importance of nutrition and industrial hygiene London clinical teachers are preoccupied with technical matters of interest to the guild, such as the differentiation of subarachnoid bleeding from cerebral hæmorrhage or the separation of coronary thrombosis from angina of effort, and they are less likely to stress really significant things which are new but not easily incorporated in their craft, such as the facts that a high carbohydrate diet requires more vitamin B, or that compensation tends to increase the incidence of the disability compensated The cynic cannot but observe that the deification of London applies not at all to the fundamental sciences

In surgery also famous schools have recently flourished outside London—in Edinburgh, Leeds and Newcastle, for example It is internal medicine and related subjects such as pediatrics and psychology which have received excessive representation in London and this suggests to me that as at present practised they are luxury trades The state of affairs in America and Germany where there are many university schools of equal prestige, is much healthier and the whole time or semi whole time clinical units in the Scottish universities in Manchester, Cambridge and Oxford, may restore British medicine to a better condition For highly trained physicians to do much of the pettifogging work that is done in the Harley Street area is as if the president of the Royal Society was employed at mending old ladies' wireless sets It is perhaps no worse than the tradition in music where artists of the calibre of Hindemith may give lessons for fees and cannot very well pick and choose their pupils, but it links medicine with the seamier side of the arts I was going to say that medicine

should be more of a priesthood; but the church has been commercialised for centuries and bishops more commonly celebrate marriages in Westminster than in Wigan.

* * *

The sixty-mile journey to London takes little over an hour and the time passes pleasantly enough. For the two-mile journey from Paddington to the Royal Society of Medicine the bus requires twenty minutes and a succession of stops, but this allows me to study the most important section of Oxford Street and the crowd which throngs it. The concourse of women busy about nothing impresses me with one of the less favourable aspects of the rise in the standard of living. Seen from the top of a bus one must perforce regard them as a herd or group and criticise them on the basis of the opportunities they have had and the æsthetic pleasure they provide. The poets have stated that they are less beautiful than the animals and with this one cannot but agree. Nor can they compare with the crowds in clogs and shawl against whom I jostled on the streets of South Lancashire thirty years ago. Those women were rude and coarse but they expressed vitality and they wore a local costume or industrial uniform which enhanced the looks of the pretty and made the whole group attractive. The outburst of sympathy for Gracie Fields expresses a nostalgia for a day which has gone since Mrs. Deeds came to town. To see an attractive crowd today one has to travel to Ireland or to the Mediterranean—somewhere in fact where poverty still reigns.

It is curious that women who pass so much of their time gazing in shop windows and spend a big proportion of their income on clothes should make such a bad job of it. The colours are drab, there is no sense of form, and the lines of hat, neck-line, waist and skirt clash in a way that the most amateur student of composition would avoid. Skirts are either too long or too short, and high heels throw the silk stockings in wrinkles or make the calf muscle unpleasantly prominent. Hair has improved in the last two years as bobbed hair has grown a little longer but is still too often either frivolous or frowsy. Finally, modern outdoor dress for women is exceedingly unkind to those—and they are the majority—in whom the contours have begun to sag. An Indian woman in her sari, however old her face or form, appears in this crowd like a songbird amidst the sparrows.

I will not deny that the area between Marshall and Snelgrove and Dorville reveals some better lookers, but these are largely young saleswomen and buyers whose face is their fortune. Moreover the last thing I grumble at is that women are attracted by pretty things in shops. I read *Vogue* regularly and I appreciate the thrill women get out of colours, surfaces, textures, furs and jewels. It is not the expense which is lamentable but the result. About the only dress in which a crowd of women looks really attractive today (and remember I am thinking of them as groups and not as individuals) is the semi-nude of the bathing beach, the tennis-court and evening dress. Allow them more liberty and they become fussy or dowdy. Access to the materials and markets of the world has been as bad for the modern woman as for the modern builder, and women's dress today is as depressing to look at as the new estates they live in. I do not believe the average crowd of women will ever look attractive unless their dress freedom is confined within narrow limits, but until we can provide the right amounts of Norman Hartnell and compulsion, the promenaders in Oxford Street will continue to be unprepossessing and I on top of my bus will sigh for the attractive crowds of Kos and Rhodes.

When I look into the faces of these women, I feel that very few of them have "laid hold on life" in the words of the hymn tune or are keeping themselves in intellectual or spiritual training. Behind them I see the English middle-class home. No account of trench warfare makes the reader feel its boredom, and no play, film or novel sufficiently stresses the insipid quality of English bourgeois life. With the decline of child-bearing and of religious interests the field of consciousness has narrowed at the same time as the amount of leisure has increased. The day passes with aimless chatter as to why Mrs. X has changed her window curtains, what year Princess Y had her operation, whether the latest child-murderer has a kind face, and the like. Much of the discussion leads to bickering and rouses emotion out of all proportion to the context, for the atmosphere is charged with unutilised energy and any little lightning conductor attracts the storm. All those trivialia and tempers are stamped on the faces of the Oxford Street women. And so let us leave them to get back to their jerry built homes.

* * *

I really do not know why I pay fifteen guineas a year to a club when I usually lunch at the Royal Society of Medicine, close to my books and journals. The creation of the Royal Society of Medicine out of a group of pre-existent societies impresses me as one of the greatest feats of our time; and if any survive of those that worked that miracle, I should like them to know that we of a younger generation bow down and call them blessed. For the Royal Society of Medicine is undoubtedly as efficient, obliging, useful and comfortable an institution as any man could hope to belong to.

* * *

But I must hurry off to my committee, which, after all, is the nucleus round which the rest of the day's activities cluster. It is customary and of course easy to regard committees as the bane of professional life. This is partly because they are not called board meetings, attendance at which is handsomely rewarded, but it is even more because they are so often inefficient at their work. Hospitals cannot function or laboratories be built without some mechanism for pooling the knowledge and advice for their direction, but the method of representative government commonly followed in colleges and hospitals, where every fellow, or everyone who is in charge of beds or head of a department, is on the committee, is fundamentally wrong. A college does have the advantage of a permanent president, but the chairman of a hospital committee is commonly appointed on grounds of seniority rather than efficiency. When I have seen a hospital committee solemnly discuss whether the charlady should retire on pension at 55 or 60, or a college meeting with an attendance of nearly forty fellows, whose time must be worth at least 15*s*. an hour per head, waste half an hour deciding whether the catalogue of college plate should be duplicated or printed with pictures, I have realised only too clearly why democracy has failed in so many countries.

The Medical Research Council, with a highly skilled permanent secretariat, an independent chairman, a limited membership of experts with regular retirements and replacements, and a large number of specialised subcommittees of a purely advisory nature, seems to me a model which might be more widely copied

There is no medical or paramedical organisation in the country which spends £250,000 a year with greater wisdom or profit With the development of joint hospital boards and hospital amalgamations important committees have swollen to gigantic size, and they should now regard themselves merely as a folk moot which will create a new instrument of government and then disband I have said elsewhere that most medical schools would do well to have their organisations overhauled at intervals by a business psychologist or efficiency expert and I am sure that the trend is towards smaller executive committees with greater authority, more employment of junior staff on advisory committees, more whole time administrative personnel, and the disappearance of the idea of a committee as a soviet or a place to blow off steam

* * *

Blackham's amusing article sets me wondering why the applied physiologists, who are so happy for an excuse for a trip abroad, have never taken up the study of sea sickness They have dwelt on Pikes Peak and with sulphur miners on the high slopes of the Andes, they have raced their mules in the torrid deserts of Mexico, they have heard the avalanches roaring down Everest and the ice cracking at the Poles, but I do not remember ever to have read of an expedition to study sea sickness Of course it would be difficult to do laboratory experiments beforehand, for everyone seems to agree that behaviour in the Barany chair has little to do with a life on the rolling main Nor does there seem to be much to measure, for though a series of papers on the *Electrolytes of the plasma, the sweat and the vomit in sea sickness* or *Audiometric tracings in the prevertiginous stage of morbus maris* might look well in my department mental report, they would merely add to the literature and not lessen the burden of sea sickness And then there is the horrid psychological factor

So it is clear that it is no use applying to the applied physiologists, and our ship must be manned by men of robuster breed, the clinical experimental therapeutists We believe that it can be quite a profitable occupation to put drugs of which we know little into bodies about which we know still less, provided we follow certain general rules, which are now pretty clearly established It often requires a great deal of moral courage on the part of both patient and investigator, as is clearly shown in Murphy's account of the discovery of the liver treatment of pernicious anæmia Mainly by these methods we have found that nitroglycerin relieves angina, theophyllin-ethylenediamine relieves periodic breathing, adrenaline asthma, ergometrine migraine, and phenobarbitone and diphenylhydantoin relieve epilepsy, and we believe that by the same methods we shall find a symptomatic cure for sea sickness nocturnal enuresis, colon spasm, chorea, and most other manifestations of this type, perhaps before we know what is happening to the cholinesterase or the catalase gradient in them We finally believe that we shall creep back into the fold under the label of chemotherapeutists now that empiricism is once more in fashion So if anyone will supply me with a boat of 15,000 to 20,000 tons, and about 300 passengers who have been bribed by cheap cruising rates to agree to accept when necessary special diets, drugs and routine ward procedures, I shall be very happy to organise an expedition to study sea sickness On our first trip we shall probably go north, as it sounds rough north of Cape Wrath (though I believe the name really means the turning point), and in any event I have always wanted to see Greenland's icy mountains

PUBLIC HEALTH

ADVANTAGES OF CENTRALISATION IN THE HOSPITAL TREATMENT OF FEVERS

BY DUNCAN FORBES, M B L, M D Edin, D P H
LATE MEDICAL OFFICER OF HEALTH FOR BRIGHTON

PRIMARILY fever hospitals were built to provide for the *isolation* of patients, for it was hoped in this way to control the spread of such diseases as scarlet fever and diphtheria Just as the exclusion of home contacts with measles fails to prevent the spread of the disease throughout infected schools, because the chief sources of infections are the large numbers of school contacts who develop and spread the disease, so the isolation in hospital of scarlet fever and diphtheria patients has failed materially to affect the incidence of these diseases, because the chief causes of spread are the overlooked case and the carrier who freely mix with their fellows Further, patients nursed with others not only run a risk of contracting diseases such as measles and chickenpox, but often have their period of infectivity prolonged for instance a large proportion of cases of scarlet fever acquire other strains of hæmolytic streptococci which render them more highly infectious on discharge than home nursed patients The chief function of the fever hospital therefore, is no longer the isolation but the efficient treatment of the patient, including the prevention of cross infection during his stay in hospital

The public, influenced by the fear of the spread of infection, did not grudge the capital cost of fever hospitals because they regarded, and still regard, the isolation of these dangerous patients in hospital as of primary importance to the common weal Unfortunately they have not the same interest in the cure of the individual patient in hospital, and although it has been proved that to prevent cross infections the present large undivided wards should be supplemented or replaced by smaller ward units and cubicle wards, local authorities are loth to expend money for the provision of these They are equally backward in the provision of efficient medical treatment for the patients

EFFICIENCY IN TREATMENT IN LARGE AND SMALL HOSPITALS

It is not surprising therefore to find great variations in the standards of treatment possible of attainment in fever hospitals There is no doubt that higher standards are maintained in the large fever hospitals provided, for instance by the London County Council and the large county boroughs There we have medical superintendents in charge who give their whole time to fevers and who are assisted in their work not only by a resident medical staff and a highly trained nursing staff but also by visiting consultants Patients are seen by a doctor in the ambulance or receiving rooms before admission, doubtful cases are properly isolated and all patients are at once given appropriate treatment including

the *intravenous* injection of antitoxin in most cases of diphtheria.

Compare this with conditions in a small fever hospital in charge of a matron who sees the patients on admission. Later she telephones the doctor in charge who gives instructions and prescribes treatment on the matron's report. If the patient is severely ill the doctor pays a special visit as soon as he finds it possible, the moderate and mild case may not be seen until his next routine visit. Administration carried out on these lines is likely to lead to disastrous results from time to time In diphtheria, for instance, antitoxin is usually administered *intramuscularly* by the matron. This leads to a great lengthening of the interval between the admission of the patient and the entrance of antitoxin into the blood-stream, regardless of the fact that each hour's delay increases the danger of subsequent paralyses and may even mean the difference between recovery and death When we consider that, to ensure the earliest possible entry of antitoxin into the blood-stream, general practitioners are advised not to await a swab result before notification, and that patients are admitted at any time night or day, such delay in, or omission of, *intravenous* injection on the admission of the patient seems inexcusable. Again, even if the non-resident doctor hurried to the hospital to be ready to treat on admission the occasional case of diphtheria, he might find difficulty in giving an intravenous injection to the young child with an abundance of subcutaneous fat. After the closure of the fontanelle it may be necessary to cut down on a vein or to give an intraperitoneal injection, and these methods being unfamiliar may not be adopted. In any case success is more likely to attend the resident physician who treats large numbers of cases in a large fever hospital

Passing to another matter, supervision and treatment by the specialist, for instance in middle-ear disease, are more easily arranged and more conveniently carried out at the large well-staffed and well-equipped hospital.

These are but examples which could be multiplied, as the whole administration of the fever hospital is now highly specialised as to treatment, nursing, and isolation. No-one with a knowledge of the subject doubts that, broadly, the larger the hospital is, the more highly qualified the medical staff, the better the facilities provided and the higher the standard of treatment.

GROUPING

Under section 63 of the Local Government Act, 1929, and section 185 of the Public Health Act, 1936, county councils have had surveys made and have submitted for approval to the Ministry of Health schemes which should have ensured adequate provision for the isolation and treatment of persons suffering from infectious disease Such schemes were made after consultation with the component authorities and, when necessary or when deemed advisable, with county boroughs As the Ministry of Health was in favour of infectious diseases being treated in central hospitals, of a size which would constitute efficient and economical self-contained units, serving reasonably large areas, and as most county medical officers were of a like opinion, it no doubt was the aim of the latter to concentrate treatment in a few large rather than in a great many small hospitals Their difficulty was "to reconcile the individual and often conflicting claims of the several isolation hospital authorities in the county, so that the best use might be made of the existing accommodation."[1] It was still harder for the county medical officer of health, with any hope of success, to suggest a general closure of small hospitals and the establishment of a large central hospital, even when he recognised that such a procedure would lead to greater efficiency in treatment and in the long run to economy. Likewise it was not a simple matter to have any large number of beds reserved in the relatively large county-borough fever hospitals unless the county council agreed to pay the cost of the additional accommodation required The result is that progress has been slow and there still remains a multiplicity of small fever hospitals, although the earlier average of some 40 beds has no doubt been increased to a small extent

AREA WHICH CAN BE CONVENIENTLY SERVED BY A FEVER HOSPITAL

In the days of the horse ambulance and indifferent roads, distance was a serious matter In a well-sprung motor ambulance 30 miles can now be covered in an hour with no discomfort to the patient. There is no reason, therefore, if otherwise convenient, why a centrally situated hospital should not serve an area of 2700 square miles or more Naturally if it were decided to centralise treatment the largest hospital in any area would be selected, and its accommodation increased as required and brought up to date The smaller hospitals closed for fever work could often be used in a conjoint scheme for other purposes, as continuation hospitals, or for convalescents, tuberculosis, orthopædic cases, rheumatic hearts and even for overflows from the central fever hospital at peak periods in infectious disease incidence. Practical experience shows that parents have no serious objection to the removal of fever patients to a distance, so long as they are kept informed of the patient's progress and are asked to visit if the patient is dangerously ill The very fact that the patients were drawn from a wide area would minimise, although it would not overcome, the difficulty of staffing due to the continuously varying incidence of infectious disease[1] In this connexion I find that, taking an area, including boroughs and urban and rural areas, with a population of over 400,000, the number of notifications over a period of eight years was at peak periods for scarlet fever 2½ times, and for diphtheria 3 times, the average, whilst for a town of 150,000 the peak figures for both scarlet fever and diphtheria were 4 times the average

The following figures show the number of notifications in 4-week periods for the larger and smaller populations mentioned above.

NOTIFICATIONS IN 4-WEEK PERIODS

	—	Over average	Average	Under average	Maximum	Minimum
A	Scarlet fever	27 (113)*	1 (71)	63 (44)	180	19
	Diphtheria	31 (32)	4 (18)	56 (9)	57	2
B	Scarlet fever.	31 (41)	4 (22)	56 (11)	95	2
	Diphtheria	32 (16)	7 (8)	52 (4)	43	0

A = Population, 400,000, B = 150,000

* The figures in parentheses show the average number of notifications in the periods named, thus there was an average of 113 notifications in each of the 27 weeks when scarlet fever was over the average

It is evident from these figures that, whether the population be large or small, there will tend to be rush periods alternating with longer periods of under-occupation and over-staffing. Such difficulties are more easily overcome in the large hospital with a sufficiency of cubicle blocks and varying sized wards,

1 See the fifteenth report of the Ministry of Health, p 67.

quite apart from the lesser variations in the number of notifications in the larger, compared with the smaller, populations served

The Departmental Committee on the Cost of Hospitals, in its final report, states that to provide a small (fever) hospital with the full equipment and facilities appropriate to a large one would be unduly costly, and that it is hoped that, by coöperation on the part of local authorities, the erection of very small isolation hospitals in the future will be avoided

HOW REFORM CAN BE ATTAINED

If it is agreed that the small fever hospital with no resident medical staff should be closed when possible, how can this desirable reform be attained? What can be done for instance in the case of a county borough with a combined sanatorium and fever hospital of 170 beds requiring the addition of cubicle blocks to bring its accommodation up to date? A fever hospital of 50 beds is situated within some four miles, and four other fever hospitals of 28, 18, 12 and 12 beds serve areas within a reasonable distance, none of these five hospitals have a resident medical officer Can we hope that the county, the county borough and the other authorities concerned will grasp the urgent need for centralisation of fever work in the relatively large county borough hospital, will get together, and, within the next two or three years, agree on a scheme for the centralisation of their fever work? Only the confirmed optimist would answer in the affirmative Whilst some good work has been done under section 63 of the Local Government Act, 1929, and section 185 of the Public Health Act, 1936, progress is slow and is not of the radical nature required, the reforms carried out still leave, unclosed for fever work, large numbers of small fever hospitals with not even one resident medical officer The history of the last ten years proves that the present unsatisfactory arrangements for the efficient treatment of fevers will be continued indefinitely unless greater powers be given to the Minister of Health it should be made incumbent on him to review the position, to revoke earlier schemes when such appears desirable and to insist on concentration of work in larger units with resident medical staffs In short, he should be able to formulate schemes to ensure the greatest efficiency in treatment in any particular area Failing additional powers he could refuse to approve schemes which did not provide adequate treatment in so far as they included small hospitals without a resident medical officer

In recent times a great deal has been done to rationalise various industries with a view to increased efficiency and the lowering of working costs, and effective pressure is being brought to bear in cases in which desirable amalgamations have not been made voluntarily Surely the same principles could be applied to our present fever hospitals with a view not only to economy but to the better treatment of the patients

A COMBINED MUNICIPAL AND FEVER HOSPITAL

Now that patients suffering from pulmonary tuberculosis and orthopædic patients have been nursed in fever hospitals without bad results, the question has been raised as to whether the fever hospital could not form a part of the municipal hospital In this connexion it has to be remembered that the nurses in fever hospitals must be protected against diphtheria, scarlet fever and the enteric group, that children in the orthopædic wards must be protected against diphtheria, that nurses from any particular fever ward should not mix freely with the nurses from other wards, and, when they are transferred from fever wards to duty in other wards, steps should be taken to ensure that they are not carriers Thus shows that the addition of fever wards to the municipal hospital would add to the difficulties of the medical superintendent and matron and might have serious results when these officials were not thoroughly versed in fever administration The resident medical officers in charge of the fever wards might at times have no special fever experience and be out of touch with the health office staff The plea has been made that fever wards in slack times could be used to relieve crowding in the general wards, but a moment's consideration is enough to convince one of its futility except to get over a temporary difficulty until new accommodation is provided Taking all these matters into consideration it would seem that the disadvantages of the combination of the municipal and fever hospitals far outweigh its advantages

EXPEDIENTS JUSTIFYING THE APPOINTMENT OF A RESIDENT MEDICAL STAFF

In cases in which the number of beds in a fever hospital fails to justify the appointment of a resident medical staff, the difficulty may be overcome in the following ways The number of beds can be increased by the building of wards in the fever-hospital grounds for the nursing of tuberculosis and orthopædic patients The municipal laboratory may be established at the fever hospital and sputum swabs and bloods, sent by general practitioners, examined there General practitioners may be invited to call out the senior resident medical officer to see or consult regarding doubtful cases, and at times the senior medical officer may be attached to the staff of the medical officer of health and put in charge of fever work generally Such expedients are worth while when the medical officer of health cannot otherwise obtain a resident medical staff for the fever hospital

CONCLUSION

The primary object of these notes is to emphasise the need for the more efficient treatment of the fever patient which can only be effected by the centralisation of fever work in large units with a resident medical staff To attain centralisation in a reasonable time additional powers and duties must be assigned to the Minister of Health

The position is well summed up in the report of the Committee on Scottish Health Services, 1936, as follows "The small infectious disease hospital providing for only the three diseases—diphtheria, scarlet fever and enteric fever—is now regarded as obsolete, with modern transport facilities it is not longer necessary except in a few areas, it cannot provide the facilities for treatment that modern knowledge demands, and in relation to its effectiveness it is uneconomic"

Smoke Abatement

A draft order has been prepared by the Ministry of Health extending the list of noxious and offensive gases and works covered by the Public Health (Smoke Abatement) Act 1926 Copies of this draft order may be seen at the Ministry of Health or purchased through the Stationery Office A public inquiry will be held on this order by the Ministry's chief inspector of alkali and other works at the Ministry of Health on Sept 1 at 11 A.M. Any interested person may attend and give evidence

LETTERS TO THE EDITOR

OXYGEN IN CORONARY THROMBOSIS

SIR,—In your issue of Aug. 5 Dr. Poulton writes on oxygen therapy in coronary thrombosis. At Passavant Memorial Hospital, Chicago, whilst I was there in 1934–36, it was and had been a routine, under Dr. M Herbert Barker, to use the oxygen-tent in treating this condition We found administration through the forked nasal tube too often impracticable because of the patient's restlessness, and therefore abandoned it. In using the tent it was very important at the outset to explain to the patient what was being done and why, and in some cases extreme restlessness made even its use impossible We found it necessary to use high concentrations of oxygen but we never exceeded 60–70 per cent Another point of great importance was the careful control of the carbon-dioxide concentration and we estimated both the oxygen and carbon-dioxide content of each air sample. Long continuous periods in the tent were essential and one could only judge when it was safe to remove the patient by gradually lowering the percentage of oxygen in the tent at the end of 5–7 days, and noting the effect on the patient I am convinced that the intermittent giving of oxygen is valueless. To do all this it is imperative to have an "oxygen service" such as they have at Passavant Too often failure is attributed to the oxygen rather than to the operator.

The relief of the pain, cyanosis and restlessness—especially the latter—was dramatic, as is noted by Dr. Poulton. I agree with him that this country is unfortunately suffering from oxygen-lack.

I am, Sir, yours faithfully,

THOMAS SIMPSON.

Cheshire Joint Sanatorium, Market Drayton, Salop, Aug 9

LEAD LYING DORMANT?

SIR,—In your last issue you have a report of an inquest headed with the words "lead lying dormant?" It is the note of interrogation which prompts this letter During the last war, when stationed in a district largely populated by C.3 men, one saw a very large number of cases of acute lead colic in men who had been free from such symptom for many years Some of these narrowly escaped removal of their appendices. More interesting still were the cases of acute anæmia, paresis, and so forth, in quite young men whose occupations exposed them to the risk of lead poisoning and whose symptoms seemed to have been occasioned by the unusual physical exercises involved in army life In both classes of case it seemed impossible to doubt that lead had been lying dormant, only to be brought back into circulation by military service.

I am, Sir, yours faithfully,

Sevenoaks, Kent, Aug 12 GORDON WARD.

BIOPSY OF THE ENDOMETRIUM

SIR,—From your interesting leading article last week one gains the impression that biopsy curettage in this country is an innovation, and mention is made of the uterine aspirator described by Lorincz and Davis this year (*Brit med J.* 1939, 1, 261)

There is no doubt at all that the so-called office technique, using a small biopsy curette, is an invaluable aid to the correct administration of hormones for menstrual disorders or sterility, and a saving in time and money to the hospital Such biopsies have been carried out by me in the outpatient department of the Royal Infirmary, Bristol, since the end of 1936, using a suction curette designed by myself (*Lancet*, 1937, 1, 698) or a still more simple curette designed by Sharman and Sheehan (*Brit med J* 1937, 1, 965) By the use of these biopsy curettes excellent pieces of endometrium can be obtained for section, and for all but the most nervous patients with no anæsthetic of any kind; they can go home immediately without any discomfort

This method of diagnosis of ovarian activity should be more widely appreciated by gynæcologists Considerably more sections of endometrium, obtained at a sensible time in the cycle, would give valuable aid to the endocrinologist and would vastly simplify the pathology and physiology of the endometrium to the pathologist, who should also be supplied with a detailed menstrual history.

I am, Sir, yours faithfully,

Bristol, Aug 12 GEORGE L FOSS

PHYSICAL METHODS IN RHEUMATIC DISEASE

SIR,—I am not surprised to read Dr Troup's letter in reply to the report by Sir Leonard Hill, F.R.S., and myself published by the Empire Rheumatism Council. No doubt all the methods we criticise are in use and no doubt also they will be hotly defended by their users Herein lies the key to the unfortunate position which physical medicine occupies today. The system of testing and approving (or otherwise) of apparatus to be used for physical treatments carried out by the physical-medicine committee of the American Medical Association is one that cannot fail to recommend itself to those who have the welfare of this subject in mind.

I am, Sir, yours faithfully,

H. J. TAYLOR

Empire Rheumatism Council, Alexander Maclean Laboratory, Ranelagh Road, S W 1, Aug 14

THE NIGHT-BLIND AIR-RAID WARDEN

SIR,—I was on duty during the black-out, and encountered, like all other A R P. workers, the difficulty of doing my job in a darkness that seemed very nearly complete It seemed to me however—and this is the point—that seeing in the dark was much more difficult than it had been during last winter when taking country walks at night At that time I was taking the normal winter precaution of a course of halibut oil But I had discontinued that for about five months before the black-out, when I found my night vision, apparently, so poor

What I want to know is—was the deterioration in my eyesight only a subjective impression, or are there real grounds for the story that halibut oil improves the capacity to see in the dark? If the latter, then we of the A R P. ought certainly to take appropriate action.

I am, Sir, yours faithfully,

Aug. 15 AIR-RAID WARDEN

*** Night-blindness and sluggish adaptation to changing states of light and darkness are associated with deficiency of intake or absorption of vitamin A, and should be cured or alleviated with cod liver oil or halibut-liver oil To quote from our own columns, M. K Maitra and L J. Harris found that only 40 per cent of 200 elementary-school children in Cambridge and the east of London showed normal dark adaptation, compared with 90 per cent. of public school boys; but deficiency was less evident as age increased, for none of 38 mothers bringing children

to a school clinic were definitely subnormal, and 18 out of 22 healthy adults were normal in adaptation (*Lancet*, 1937, *2*, 1009) N T Gridgeman and H Wilkinson (1938, *1*, 905) tested about a hundred healthy adults and thought that some 30 per cent were subnormal The improvement on taking vitamin A did not, however, seem very great C Vaillant and L Gillis (1939, 1, 149) record a case of severe night blindness cured with vitamin A though the patient's diet appeared normal —ED L

THE PROBLEM OF MEDICAL LITERATURE

SIR,—In 1807 Sir John Sinclair, famous father of the Board of Agriculture, published in four volumes his "Code of Health and Longevity," undertaken, as he said, to ascertain "how far it was practicable, to condense and systematize human knowledge, concerning any particular branch of science, the necessity of which, is becoming every day more apparent" On Sinclair's plan, science was to be divided into its different branches and for each division "an intelligent person" was to analyse all that was published on it Collections were to be made of the writings of every author, whether ancient or modern, who had written either directly or indirectly on the matter in question, and all valuable observations were to be abstracted and digested by "an able person with a committee of assistants" A concise summary was to be translated, at the expense either of the Government or of a society established for the purpose, into all the principal languages of Europe Such a work would then be regarded as a code (hence the title of Sir John's book on longevity) to which all future publications regarding it must refer

"Unless some such mode, of arranging and condensing human knowledge, is fallen upon, the world will be overwhelmed with a load of literature, without deriving, in any degree, that advantage from it which might otherwise be obtained Indeed, in its present state, knowledge may be compared to a small portion of gold, dispersed throughout a great quantity of ore In its rude condition, the strongest man cannot bear its weight, or convey it to a distance, but when the pure metal is separated from the dross, even a child may carry it without difficulty"

I am, Sir, yours faithfully,

Aug 11. Dr PANGLOSS

OBITUARY

RICARDO JORGE

M D

Professor Jorge, whose death on July 31 was recorded in our last issue, won his international reputation by his work on the major epidemic diseases, notably on plague, typhus and yellow fever, on which he was the acknowledged successor of Carlos Chagas He was born in 1858, and after studying medicine in his native town of Oporto soon made his mark—not without much opposition but with the active support of Camera Pestana—by his campaign against plague, indigenous in Portugal until late in the nineteenth century A number of brilliant studies, including the epidemic of the "zaire," from which emerged new light on the prophylaxis of cholera, made his name known across the frontiers of Portugal, and his appointment as director general of public health widened the field of his activity He represented his country on the International Health Office, Paris from 1912, when Portugal ratified the Rome agreement of 1907, continuously until his death His first report to it was on undulant fever and since then have followed a long series of reports, monographs and communications in discussion duly reported in the Monthly Bulletin of the Office on a wide range of communicable diseases and on the problems that confront the practitioner and the administrator called upon to treat and to prevent Of many examples, bearing witness to his ability and erudition may be cited his contributions to the study of pellagra, his classical analysis of the relation of alastrim (variola minor) to smallpox his description of an outbreak of Weil's disease in Lisbon traced to a rat infected fountain and his review of encephalitis following

vaccination, published in our own columns in 1932 But he was happiest when engaged in the study, and, especially in his later years, in the historical research into his two favourites, plague and yellow fever On yellow fever, of which he had seen much in Portugal and in Brazil where he worked with Chagas, he was an acknowledged authority The later "jungle" type of that disease, however, caused in him much perplexity of mind and he never could quite accept the evidence and the hypotheses on which this new form and conception of amarillic infection were based He could swallow, up to a point, evidence of the presence of the virus as shown by the mouse-protection test, and of an amaril like infection demonstrated by liver section post mortem, but he could never quite satisfy his instincts and his desire for clinical evidence of the recognised signs, symptoms and high mortality of true yellow fever, so often absent in the so called jungle variety of that disease Consequently, the spread of the virus in recent years throughout Brazil, and the discovery of an alleged case at Wau in the Sudan and later at Malakal, disturbed him, and to the end he was not converted Nor (it must in fairness be said) are all his colleagues On plague it suffices to recall the following contributions from his pen "The rôle of rodents and fleas in the conservation and transmission of plague," "Sylvan plague and its distribution in Africa," and lastly his '*Summa epidemiologica* of the knowledge of plague'

Besides representing Portugal at the Paris Office, Ricardo Jorge was an original member of the health committee of the League of Nations on which he was appointed in 1923 The many demands of his work as *director general of public health in Portugal* did not prevent him from acquiring renown in matters national and cultural His supple intelligence ranged over a large variety of subjects in art, literature the etymology and science of language, philosophy and history and he has been compared with the savants of the Renaissance—encyclopædists to whom nothing was unknown His works on Greece are celebrated He revealed and recalled by his studies the grandeur of the Portugal of the seventeenth century, particularly by those on Rodrigues Lobo By his history of

research he dissipated and refuted the many calumnies surrounding the life and death of Jean II. In contemporary affairs he was an ardent and sincere admirer of England and English institutions. He held, and expressed, often in international debate, in so forcible a manner as to embarrass his English colleagues, that England and Englishmen were the birth-place and founders of hygiene, and to them only was due all that was worth while in the promotion and development of the public health.

Small and frail in stature, the gentlest and the kindest of men, Ricardo Jorge seemed to his associates, in these modern times, something ethereal, like a fine piece of old porcelain

FRANK ROMER
M.R.C.S.

Frank Romer was born in 1871, the fifth and youngest son of Sir Robert Romer, senior wrangler, chancery judge, and chairman of a royal commission on hospitals He was educated at Sherborne where he won his rugger "cap" Later he played rugger for Middlesex: his caps always hung in his consulting-room and at his request were buried with him. He trained at St George's Hospital and after qualifying commenced general practice at Malmesbury in Wiltshire While there he injured his back when hunting and became a patient of the late Mr. Wharton Hood, the first medically qualified "bone-setter." Romer was so impressed with Wharton Hood's work and methods that he joined him in partnership, and after Wharton Hood's retirement continued the practice and specialised in this branch of treatment With great rapidity his work increased, his success being due both to his enthusiasm in developing the treatment of injuries along his own lines and also to his possessing a truly wonderful pair of hands His ideal was the earliest possible restoration of function to the injured part, this he achieved by immobilisation for the shortest possible period, encouraging early movement and commencing massage at the beginning of treatment He held strong views as to the type of massage to be employed and trained his own masseuses in his own methods. He also devised many forms of remedial exercises to meet individual cases His methods were his own—unorthodox in many cases, but often crowned with success.

[Lafayette

During the war he was medical officer on the late Earl of Dunraven's hospital yacht, the *Grainaig*, which evacuated casualties from places as distant as the Near East While visiting an injured sailor on a destroyer in a rough sea he injured his right leg and was transferred to shore, becoming specialist at the military hospitals of Edgbaston, Croydon, and Millbank in his own line of work His system of medical gymnastics and his method of treatment of injuries brought him into contact with Robert Jones and began a friendship which was of benefit to both After the war he became consultant surgeon to the Jockey Club and the National Hunt and was honorary surgeon to the College of Music and the Booksellers' Benevolent Society. He was also an officer of the Order of St. John of Jerusalem.

Romer was both versatile and talented He painted some delightful water-colours of racehorses and also executed some good models He wrote extensively and well, not only medically, but also racing novels His charm and vivid personality made him countless friends, and in the Bath Club, a favourite haunt, he had the affection of both members and staff Indeed the annual golfing dinner with Frank Romer in the chair was always a very happy evening—almost an institution Though his latter years were marred by constant suffering and many operations on his leg, culminating in amputation, he was never known to grumble at fate, and sitting in his wheel-chair he carried on cheerfully with his work to the last

HERBERT JAMES
C.B., C.M.G., O.B.E., F.R.C.S., D.P.H.

Colonel James, who died on Aug 9 at Gilston, Southern Rhodesia, was the last of three distinguished brothers. Sydney, the eldest, at one time headmaster of Malvern, was archdeacon of Dudley, Montague, the youngest, was provost of Eton from 1918 till his death in 1936. The father of this distinguished trio was the Rev Herbert James, rector of Livermere, Suffolk.

H. E. R. James was born in 1857 and received his medical education at Charing Cross He entered the R.A.M.C in 1882 and served in it until his retirement in 1908 After this he was attached to the general staff at the War Office for training medical units of the officers' training corps, until his final retirement on account of age in 1922 During the Sino-Japanese war of 1894–95 James was attached to the Chinese army and awarded the Double Dragon of China for services to the Chinese wounded From 1914 to 1918 he rejoined the active list and served in Egypt and Salonika in command of a general hospital

James was an outstanding figure in the R.A.M.C After two years as secretary to the commission of reorganisation of the army medical services after the South African war, he was appointed first commandant and director of studies at the Royal Army Medical College, on its move from Netley to Millbank in 1902. He served in this capacity for six years, and by his tact, courtesy and kindly disposition he became a friend for life to his students His active brain, his learning, his knowledge of men and affairs, and a stern sense of discipline helped him to make an enduring success of the college in its new surroundings There are many senior officers of the R.A.M.C, both regular and territorial, who owe much to the training, advice and sympathetic help which they received in their young days from Bertie James

---

DR JAMES FREDERICK EDMUND BRIDGER, who died on Aug 8, was born on March 31, 1875, and educated at St. Mary's In 1905 he became health officer to the colonial government of Barbados For a while he was superintendent of the Pelican Island smallpox hospital in Barbados, and then port medical officer. He was thus naturally chosen to be a member of the Barbados government commission which investigated the quarantine system of the port sanitary authority of New York. He also sat on a commission to report on an epidemic of eruptive fever at Port of Spain, Trinidad. Later he was translated to Ceylon where he became director of medical and sanitary services, and also principal of the Ceylon medical college. He retired from the colonial medical service in 1930.

INFECTIOUS DISEASE

IN ENGLAND AND WALLS DURING THE WEEK ENDED AUG 5, 1939

Notifications—The following cases of infectious disease were notified during the week Smallpox, 0, scarlet fever, 1508, diphtheria, 775, enteric fever, 24 (59 "expected"), pneumonia (primary or influenzal), 308, puerperal pyrexia, 178, cerebro-spinal fever, 21, acute poliomyelitis, 16, acute polio-encephalitis, 4, dysentery, 41, ophthalmia neonatorum, 100 No case of cholera, plague, or typhus fever was notified during the week

The number of cases in the Infectious Hospitals of the London County Council on Aug 11 was 2623 which included Scarlet fever, 635, diphtheria, 498 (carriers 16), measles 15 whooping cough, 652 puerperal fever, 13 mothers (plus 7 babies), encephalitis lethargica 303, poliomyelitis, 16 At St Margaret's Hospital there were 13 babies (plus 4 mothers) with ophthalmia neonatorum

Deaths—In 126 great towns, including London, there was no death from smallpox or enteric fever, 5 (0) from measles, 2 (0) from scarlet fever, 6 (3) from whooping-cough, 14 (1) from diphtheria, 21 (3) from diarrhœa and enteritis under two years, and 6 (0) from influenza The figures in parentheses are those for London itself

Fatal cases of diphtheria were scattered over 11 great towns, Middlesbrough Southport and Walsall each reporting 2 Birmingham had 3 deaths from diarrhœa Barking, Liverpool, Manchester, Sunderland and Nottingham each 2

The number of stillbirths notified during the week was 214 (corresponding to a rate of 34 per 1000 total births), including 30 in London

MEDICAL NEWS

University of Glasgow

A short course of lectures on some recent advances in ophthalmology will be given on Tuesdays from Sept 5 to Oct 10 at 4.30 P M in the Tennent Memorial Building, 38, Church Street, Glasgow Prof A J Ballantyne will discuss problems of vision in aviation at the first lecture and radiodiagnosis and radiotherapy at the last Other speakers will include Dr John Marshall (problems of blindness—causes and prevention) Dr I Chesar Michaelson (pressure problems—ocular, cerebral and circulatory), Prof A Löwenstein (the eye and nervous diseases), and Dr A M Wright Thomson (ocular therapeutics) The lectures are open to all who are interested

Preventive Paediatrics

The seventh congress of the Association Internationale de Pédiatrie Préventive will be held in Lausanne from Sept 22 to 24 *The main subjects for discussion will be* prophylaxis of physical and mental disorders in puberty, and maternal and infant welfare in rural areas Further information may be had from Dr D Oltramare secretary of the association 15 rue Lévrier, Geneva

Billeting in Brief

A summary of the Government evacuation scheme for children, with hints to householders who would be called upon to care for other people's children is given in a pamphlet, 'Billeting in Brief' just issued jointly by the National Union of Teachers and the Save the Children Fund, price 2d In it the authors have summarised information in the Government publications and have added some sensible hints on diet, playtime, spots, temperatures and the like

Madras Medical Council

Cases of advertisement by registered medical practitioners in the law press and by means of handbills have lately been reported to the council At a meeting on April 17 the council therefore decided to warn practitioners that all such advertisements—including even the opening of private institutions, inviting lawyers to attend such functions and the reporting of these functions in the law press—will be considered as contravening section 6 of the warning notice published by the council and will be dealt with accordingly

International Congress of Hydrology

The sixteenth Congrès International d'Hydrologie, de Climatologie et de Géologie Médicales will be held at *Strasbourg from Oct 8 to 13 Further information* may be had from Prof Vaucher, Institut d'Hydrologie thérapeutique et Climatologie, 1, Place de l'Hôpital, Strasbourg

International Congress of Gastro-enterology

The Société Internationale de Gastroentérologie will hold its third congress next year in London from July 14 to 18 Sir Arthur Hurst will preside and the chief subjects for discussion will be the relationship between diseases of the blood and gastric diseases, and regional ileitis Further information may be had from Dr Thomas Hunt, 49, Wimpole Street, London W 1

Medical Diary

Aug 21 to Aug 26

PADDINGTON MEDICAL SOCIETY
TUESDAY—9 P M (Town Hall, Paddington, W 2), Case Problems in General Practice

EDINBURGH ROYAL INFIRMARY
THURSDAY—5 P M Dr R G Gordon Emotional Disturbances as a Cause of Physical Disorders (Honyman Gillespie lecture)

Appointments

ASHFORD, HAZEL I M.D Edin, D P H assistant medical officer for maternity and child welfare for Burnley

CLARKE, ELIZABETH M R, M B Dubl, L M, D T D, assistant school medical officer for Burnley

GRAHAM, E W M B Edin. D P H medical officer of health for Stowmarket urban district, Gipping and Samford rural districts, and assistant county medical officer for East Suffolk

HOLT, R L, M D Manc, F R C S hon assistant surgeon to the Manchester Royal Infirmary

McBURNEY, W S, M B Belf assistant school medical officer for Stoke-on-Trent

PAYTON, G O, M D Birm M B Edin D P H, medical officer of health for Stourbridge

RATCLIFFE, T A, M B Camb D P M, D C H senior assistant medical officer at the City Mental Hospital, Nottingham

ROBERTS, MORRELL M D D Sc Manc M R C P clinical pathologist to the Manchester Victoria Memorial Jewish Hospital

ROBERTSON, DAVID M D Glasg, consulting psychotherapist to the Harrogate and District General Hospital

Colonial Service—The following appointments and promotions are announced—

GRAY, N M B medical officer West Africa

LAWSON, F L M B Dubl, medical officer Uganda

LEE, S W F M D Belf, D T M D P H D O M S, senior medical officer in charge Zanzibar

MAYSON BAHR, P F C, M B Camb, M R C P medical officer Tanganyika Territory

Manchester, Barnes Convalescent Hosp —Res jun M O , at rate of £150
Manchester, Park Hosp , Davyhulme —Res obstet officer, £400
Manchester and Salford Hosp for Skin Diseases —H S , at rate of £150
Manchester Royal Infirmary —Two jun. asst. M.O.'s in radiological dept , each £350.
Middlesbrough, North Riding Infirmary —Sen H S , at rate of £175
National Temperance Hosp , Hampstead-road, N W 1 —Cas O , at rate of £120 Also H P , at rate of £100
Newcastle-upon-Tyne, Barrasford Sanatorium —Res med asst , £250
New Zealand, Wellington Hosp Board —Orthopædic registrar, £500
Northampton General Hosp —Res cas O , res anæsthetist, also res H S to ear, nose, and throat dept , each at rate of £150
Northumberland County Council —County M O H and school M O., £1200
Norwich, Jenny Lind Hosp for Children —Hon asst surgeon to orthopædic dept Also Res M O , £120
Norwich, Norfolk and Norwich Hosp —Hon asst orthopædic surgeon
Nottingham Children's Hosp —Res H P , at rate of £150
Nottingham City Mental Hosp —Jun. asst M O , £475 or £350
Oxford, Radcliffe Infirmary —Res surg O., at rate of £150 Also H P 's and H S 's, each at rate of £100
Pembroke County War Memorial Hosp , Haverfordwest —Res. H S , £200
Prescot, Whiston County Hosp —Res surg O , £400
Preston and County of Lancaster Royal Infirmary —Res obstet officer, £350 Also cas H S , at rate of £150
Prince of Wales's General Hosp , N 15 —Res jun H P and H S.'s, each at rate of £90
Queen's Hosp for Children, Hackney Road, E 2 —H P and ear, nose, and throat H S , each at rate of £100 Also physician for whooping-cough clinic, 1 guinea per attendance
Queen Mary's Hosp for the East End, Stratford, E 15 —Res M O and cas O , each at rate of £150 H S and H P , each at rate of £120 Also obstet H S , at rate of £110–£130
Redhill County Hosp , Surrey —Res asst M O , at rate of £250
Royal Cancer Hosp , Fulham Road, S W 3 —Res H S to radium dept , also H S , each at rate of £100
Royal College of Physicians of London —Milroy lecturer
Royal Naval Medical Service.—Medical officers
Salford City —Asst clin tuber officer, £500
Salisbury General Infirmary —H S , at rate of £125
Samaritan Free Hosp for Women, Marylebone Road, N.W 1.— H S , at rate of £100.
Sheffield, Jessop Hosp for Women —Res M O , at rate of £150
Southampton, Free Eye Hosp —H S , at rate of £150
Stoke-on-Trent City —Asst M O for maternity and child welfare, £500
Swansea County Borough —Asst M O , £500
Warwick, King Edward VII Memorial Sanatorium, Hertford Hill —Jun asst. M O , at rate of £250.
Weir Hosp , Weir Road, Balham, S.W 12 —Jun res M O , £150
West Ham County Borough —Two R M O 's at Whipps Cross Hosp , £350
West London Hosp , Hammersmith, W 6 —H P and H S , each at rate of £100 Also genito-urinary surgeon
West Riding of Yorkshire County Council —Asst bacteriologist, £650
Wigan, Royal Albert Edward Infirmary and Dispensary — Pathologist and bacteriologist, £500
Willesden Municipal (Fever) Hosp , Neasden, N W 10 —Res M O , £250
Wolverhampton County Borough —Temp asst M O H , £600
Woolwich and District Hosp. Assn., Shooters Hill, S E 18.— H S. and cas. O , at rate of £100.
York County Hosp —H P , £150.

The Chief Inspector of Factories announces a vacancy for an examining surgeon at St Blazey, Cornwall

Births, Marriages and Deaths

BIRTHS

CALTHROP —On Aug 5, at 23, Upper Wimpole Street, W 1, the wife of Dr G T Calthrop—a son
CLEGG —On Aug 10, the wife of Dr W B Clegg, of Bishop's Castle—a daughter
HARRIS —On Aug 5, at 11, Alexandra Park Road, N 10, the wife of Dr. J S Harris—a son.
JAMES —On Aug 5, the wife of Dr Eric James, of Solihull, Warwickshire—a son
KELLY —On Aug 9, the wife of Dr J O Kelly, of Lanark—a daughter
LEECH —On Aug 9, at Mengo, Uganda, the wife of Dr R Bosdin Leech—a daughter
LLOYD —On Aug 7, at Aldeburgh, Suffolk, the wife of Dr W Jeaffreson Lloyd—a daughter
LODGE —On Aug 8, the wife of Dr John Lodge, of Edinburgh —a son
WOODGATE-JONES —On Aug 13, at 19, Bentinck Street, W 1, the wife of Dr N P Woodgate-Jones—a son
YARDLEY —On Aug 8, the wife of Dr G E Yardley, of Windsor—a son

MARRIAGE

MILLER—BOWER —On Aug 12, at St John's Church, Hyde Park Crescent, William Archibald Montgomerie Miller, M B , to Dorothy Mary Bower

DEATHS

BOWIE —On Aug 13, at 17, Sydney Street, Chelsea, S W 3, Albert William Bowie, M B Edin , L M
BRIDGER —On Aug 8, at Balladoyle, Slinfold, Sussex, James Frederick Edmund Bridger, M.B Lond , formerly director of medical and sanitary services, Ceylon, aged 64
JAMES —On Aug 9, at Gilston, Salisbury, S Rhodesia, Herbert Ellison Rhodes James, C B., C M G , O B E , F R C.S., lieut -colonel R A M C (retd)
MCCONAGHY —On Aug 9, at Camberley, Christopher Birdwood McConaghy, M B Edin , lieut -colonel I.M S (retd)
WATTS-CLARKE —On Aug 13, at 23, Kelsey Park Road, Beckenham, Richard Edward Watts-Clarke, M B Edin

N B —A fee of 7s 6d is charged for the announcement of Births, Marriages, and Deaths

THE LANCET 100 YEARS AGO

August 17, 1839, *p.* 743

Clinical remarks, by Sir Benjamin Brodie

OPERATIONS.—When I was a young hospital surgeon I entertained a very exalted idea of operative surgery, and thought very highly of the great importance of *immediately* performing an operation whenever it might seem to be required I have had much experience, however, since that time, and I now think that some little circumspection should be used beforehand, . . . You should consider well what the effect of an unsuccessful operation will be upon the minds of society at large, for every surgical operation that fails prevents two or three persons from submitting, in cases where the use of the knife might be successful This caution is required at once on behalf of ourselves, of society, and of our art Do not, then, always operate when you will by no means be sure of success . . . And at all times inquire into the state of the general health Learn if the patient be a drunkard or a free liver; and if so, beware I knew a lady of fashion, who got drunk every morning, and died from the puncture of a small encysted tumour Women of high rank are very nervous and hysterical Persons in whose families mania may have existed are bad subjects for operations They sometimes die afterwards in a very strange manner—with some very unusual symptoms

NOTES, COMMENTS, AND ABSTRACTS

PRINCIPLES OF MEDICAL RESEARCH

THE DUAL CAREER

BY LORENZ S MICHALLIS, M D Berlin, L R C P E

CLINICAL ASSISTANT IN THE ORTHOPÆDIC DEPARTMENT, ST JOHN CLINIC LONDON

IN two previous articles [1] I have given examples of what seem to be fundamental obstacles to the progress of medical research First, the real limitations of highly specialised research have been ignored, thereby leading to a series of wrong conclusions Secondly, in a different field, traditional limitations have been unjustifiably accepted as permanent, thereby seriously hampering our search for the causes of disease By deducing these two conclusions, which sound so severely theoretical, from practical examples, I hope to have made it clear that it would be worth while trying to stop these erroneous principles from acting as guides in the future To define them is one thing, to prevent them from continuing to exert their misleading influence another The right way to achieve *this lies, in my opinion, in postgraduate education* It is here that we have to search for the origin of the present lack of cohesion in medical thinking of the uncertainty in applying logic to biology, and of the ever-widening gap between clinical and laboratory research

Does not postgraduate education now tend to make the young medical Odysseus an expert in negotiating either Scylla or Charybdis instead of teaching him how to sail his ship properly in all waters? Is there not too much temptation for the ambitious man to stop his ears early with the wax of specialist diplomas in order to escape the Sirens' island of broader interests? And, having once used the wax for this purpose, does he not often forget ever to remove it, remaining professionally deaf for the rest of his life?

THE NEED

There are three groups of recently qualified men for whom postgraduate education has to be provided The first and largest consists of those who more or less immediately engage in practice, to which they are naturally inclined and in which they form an essential part of medical activity The second much smaller group contains a number of exceptionally gifted people, whose gifts are such as to drive their owners irresistibly in one direction, be it surgery or physics, radiology or biochemistry

Here we are concerned with a third group the size of which is more difficult to judge It might well be much greater if members of the first group were shown its possibilities It is the group of keen and gifted men who find themselves caught in the current of competition for practice appointments or degrees before they have had time to try and see, not only whether they belong to group 1 or 2, but whether they could not combine some of the essentials of both careers and thus build one of their own At present there is no official recognition of these

A few in this group have found a solution for themselves often at the cost of severe financial strain and many disappointments Their research work, which has not made them prisoners of their specialty, has been looked on by orthodox research specialists as amateurish and their clinical achievements have been met with distrust by clinicians on account of their "theoretical speculations."

It is, however, no accident that among them are some of the best brains and most successful explorers in medical research Their progress on the professional ladder may have been slower than that of pure specialists, but their grasp of the problems of both clinic and laboratory is swifter and more certain because of their real experience in both spheres Should not their pioneer efforts be used as a guide for mapping out a new third way of postgraduate education? This way would have to lie between practice only and theory only, between clinical research and its laboratory rival It would have to combine the essentials of thought and technique of both sides, and would have to include actual work in both spheres for a period long enough to gain real experience and yet short enough to make a "dual career" possible

The need for such a third way is greater today than ever, not only because of the bewildering growth of specialism but still more because of the need for a great number of young workers to shoulder the task of research into cancer, rheumatism and nutrition This need is comparatively new, it calls for a new, or at least an officially new, principle in postgraduate education for research

TRAINING FOR THE DUAL CAREER

The present system of medical education in this country has produced overwhelming proof of its efficiency in fitting the general practitioner and the specialist for his job, and I am not here suggesting that the organised study available for groups 1 and 2 should be altered I do suggest, however, that additional provision should be made for group 3

The young doctor would be free to choose a two years' course either in a laboratory or in the wards of a hospital After this period he would have to produce proof of research done in either sphere under the supervision of the head of the department This work, which would not necessarily have to be a paper for publication, would be taken into account for his higher degree, part of the examinations for which would be replaced by it Whether entirely new degrees were instituted or existing ones modified would not matter as long as the degrees were made equal to other higher qualifications

Having passed the examination on his first two years' work the doctor should next spend a year on the opposite side—at a hospital if his degree was gained on laboratory work and vice versa At the end of this period, during which he would again have to carry out research, he should be able to take a second degree or pass a second part of the first examination, the quality of his research again being taken into account Now he would be free to decide whether to go on with research, and if so whether in the laboratory or in the hospital or whether to go into practice

Practical research in both fields would in this way become part of the early experience of a large number of men who were to spend their lives in the laboratory, the hospital or in practice There would be fewer of that type of research-worker who has never seen a patient and for whom he need hardly exist, and less contempt for the "rabbit monger" on the part of the practical man for whom nothing exists but the patient

During these three years the young doctor should hold either junior house appointments, the number of

[1] *Lancet* 1939 i 186 and 856

which would have to be increased, or correspondingly paid junior posts at laboratories, the facilities of which would have to be extended The expense of this expansion of research should be borne by the pooled resources of the medical schools, postgraduate colleges and research organisations, all of which would ultimately gain from the raised standard and increased quantity of useful work done.

PART-TIME RESEARCH INSTITUTES

On this basis of an officially recognised third path to work and distinction the "dual career" should be carried further by providing special facilities for clinical and laboratory research for those who have done their three-year period of research training and hold the new degrees While earning their livelihood either in a practical field or as permanent members of a laboratory team they must be able to maintain contact with the "other side" and continue as part-time research-workers.

To provide opportunities for work in the wards for members of laboratories should not be difficult The provision of facilities for part-time research would require the setting aside of space, equipment and technical assistance Since this new type of work might interfere with the routine of existing whole-time research, an independent research institute should be founded for it Here expert directors would supervise research done by the part-time men, who would attend, say, twice a week for two hours according to a strict time-table.

Such an institution, once established with the help of the pooled resources of the interested bodies and gifts from donors, would form the centre of a medical research society, which might become a research section of the Royal Society of Medicine. The contributions of its members should cover part of the running expenses, but the fees should not be so high as to prohibit gifted but less prosperous men from taking part. Here the growing number of young helpers in medical research would find opportunities for active collaboration, without having to wait for one of the few openings now granted them The centralisation of work at special institutes would allow research efforts to be directed into channels where they are most needed, and would avoid much of the present overlapping Such organisation would also be a safeguard against the danger that a fall in the quality of research would accompany an increase in its quantity.

SUMMARY

Additions to the existing system of postgraduate education might help (*a*) to eliminate early over-specialisation and consequent lack of a balanced judgment in questions of research; and (*b*) to provide the qualified collaborators needed for research into cancer, rheumatism and nutrition

A "dual career" should be open to the young postgraduate, based on a three years' course in theoretical as well as clinical research.

New or amended higher degrees would be instituted, in which the value of research work done under supervision would be taken into account

The holders of the new degrees would be given adequate facilities to continue as part-time research-workers at an institute specially designed to give them access to equipment and technical assistance as well as expert advice and coördination.

ROYAL MEDICO-PSYCHOLOGICAL ASSOCIATION.—The office and library of this association will be closed from Aug 21 to Sept. 11.

RED CROSS

UNDER a plain title ("Story of the British Red Cross." London: Cassell and Co 1938. Pp. 275 8*s.* 6*d*) Mr. S. H. Best tells a romantic tale in plain words. It was at the start of the Franco-Prussian war that Lord Wantage and Sir John Furley first conceived the idea of a National Aid Society and from it soon developed the British Red Cross Since then there has hardly been a page in the annals of war on which it has not figured prominently Up till the great war the society's organisation was limited, and August, 1914, found it occupying a small office in Victoria Street, without funds but with definite plans for dealing with the conflagration its organisers had foreseen Its activities in every seat of war do not need recapitulation; to express them in terms of cash, the society had raised £17,000,000 by the end of the war. Like all pioneers it had to fight for its existence, and though many of its schemes were hailed with scorn—the V.A.D organisation for example—they lived to justify themselves triumphantly.

Mr. Best gives little space to the post-war activities of the society, but his description of its work in Abyssinia and especially that among sufferers from mustard-gas should be read by anyone who doubts the efficacy of gas as an instrument of torture to the unprepared. He says little of the part played by the society in the blood-transfusion services or in air-raid precautions, and does not mention Spain. But there is enough to enthral anyone who cares for human and humane activities

TREASURE TROVE

THE inquest last Monday upon the remarkable find of gold and silver articles discovered in the Anglo-Saxon ship burial at Sutton Hoo, near Ipswich, ended in a verdict that the articles were not treasure trove. The evidence of archæological experts, interesting as it was, could hardly be needed to establish that the precious objects were deliberately and publicly placed in the grave of the dead chief or king. As Sir George Hill points out in his admirable book on Treasure Trove, it is the hiding of objects and not the abandoning of them which gives the Crown a property in finds in England. It is often difficult to decide whether objects (for instance a single gold brooch or a single gold ring) have been hidden or merely thrown away or lost. The coroner in the recent case rightly pointed out to the jury that concealment in secrecy, with intention on the part of the owner to return and recover his hoard, is an essential point to consider. In the Sutton Hoo ship burial, the ship had been hauled up from a stream 100 feet below and had been dragged into a large trench 100 feet long, 20 feet wide and 10 feet deep A large mound had been erected over the final structure, containing at least 1000 tons of turf cut from the surrounding heath The objects of gold and silver would have been buried with the dead man for the traditional purpose of ministering to his comfort and dignity in another life. Probably the ceremony was accompanied by many days' celebration and feasting. These facts and inferences negatived any idea of hiding or concealment in the case of the Sutton Hoo treasure and therefore removed it from the technical category of treasure trove.

In the various legal systems of this and other countries there has nevertheless been doubt whether gold or silver was treasure trove when deposited in a tomb or coffin. Ancient Roman law introduced a complication by providing that to bury a body in a place was to lose possession of the place. In an Italian case, decided some forty years ago, a court in Florence held that the contents of an Etruscan tomb were treasure. In English jurisprudence, which has its own peculiarities, the so-called Laws of Edward the Confessor declared that treasures from the earth belong to the King unless they be found in a church or cemetery (*in ecclesia vel in cimiterio*).

Thirteen gold nobles found in a vault under the church floor at Halsall, lying on top of a coffin, were held by the Treasury in 1922 to be treasure trove Here, Sir George Hill says, there was no coroner's inquest Presumably the coins, having been placed outside the coffin, were not buried for religious reasons but with the intent to return and recover them. Sir George Hill cites another case of uncertain date where pennies of Alfred were found in the hollow of the left shoulder of a skeleton at Leigh-on-Sea These were declared not to be treasure trove It is a matter of history that the Crown granted licences or directions to dig in howes or barrows from early times in England in search of treasure There is an order to the Earl of Cornwall in 1237 The rifling of hoards, whether in the interest of the public exchequer or the predatory individual, must have been common in all ages The life of St Guthlac shows that at the end of the seventh century the saint made his habitation in a chamber discovered by searchers for treasure in the side of a barrow It is satisfactory to know that treasures still survive and that, as in the Sutton Hoo case, the owners will provide for their public custody

CHEWING THE CUD AND FROG IN THE THROAT

A CASE of pseudo-rumination is reported by J B L. Valle, who uses the term "mericism" for it He says that it is a nervous tic that depends on the abnormal shape of the stomach, is very rare, and is to be distinguished from involuntary regurgitation, which is very common (*Bol Soc med chir Juiz de Fóra*, 1938, 11, 415) This chewing of the cud is commoner in men than in women and is seen in imbeciles It hardly differs from the physiological act of ruminants and takes place usually 10–20 minutes, or rarely 3–4 hours, after food There is possibly some connexion with aerophagy, and Valle points to the analogous action in birds (we may instance "pigeon's milk" and the pellets of robins, kestrels, owls, and kingfishers) and the custom of the ancient Romans, at their orgies, of inducing voluntary vomiting by titillation of the uvula

Valle distinguishes two types simple and pathological The former is congenital in normal healthy persons and is habitual and quasi unconscious The pathological type is due to dyspepsia or nervous disease He had known his patient for ten years and describes him as a healthy man aged 35, working for his living There was no neuropathic history in the patient or his family He had always chewed the cud, and up to the age of 12 he had thought that everybody did so He then became anxious about his peculiarity and wished to be cured There was no sign of disease, and his intelligence was excellent Valle tried psychotherapy, including suggestion and attempts at voluntary control, but failed to cure him

In this connexion it is interesting to note that there is at present a man who earns his living in the south of France partly by exploiting his powers of returning his gastric contents at will He begins by drinking about three litres of water while balancing a chair on his forehead Patter follows to the effect that he has drunk too much and will return some Thereupon he ejects a stream of water about a yard long with considerable force Next he takes a frog and, placing it head first between his lips, gradually sucks it into his mouth and swallows it (fig 1) More patter follows, and after a minute or so he swallows a second frog Eight frogs in all are swallowed, with intervals of patter He then talks and laughs for about five minutes before regurgitating the frogs, which come singly out of his mouth (fig 2) at intervals of about a minute between spells of patter The whole process appears to be entirely voluntary He

FIG 1—Going down

FIG 2—Coming up

gains roars of laughter and applause by announcing that one particular frog says: "When I come back to the world, I like to climb on to master's nose." The announcement of the forthcoming return of a frog precedes the frog's actual return by a few seconds.

CARDIAZOL AS A DEPRESSANT

AFTER comparing the results of treatment of schizophrenia with Cardiazol, sodium Amytal, and alcohol, W. P. Berrington (*J. ment Sci* May, 1939, p. 474) concludes that these drugs act in a similar manner and produce their effects on catatonic stupor by virtue of a depressant action on the highest inhibiting (cortical) centres, as originally suggested for sodium amytal by M. W. Thorner Twelve patients were treated with alcohol, and the results were like, though less pronounced than, those of sodium amytal. Berrington also thinks that studies of prepsychotic personality of catatonic dementia præcox support the hypothesis of excessive inhibition as the modus operandi of one type of catatonic stupor.

There is much contradictory evidence about the supposed modes of action of cardiazol, but support for Berrington's view may be found in the results of earlier experiments on animals. Thus A. H. Maloney in 1936 described the production of depression and death with large doses of this drug, and A. Leroy and P Clémens in 1937 noticed catatonic reactions to cardiazol in experiments on rats: 1 mg caused diminution of spontaneous and of provoked muscular activity, 2 mg. produced convulsions, hyperæsthesia, and hyperkinesis; while larger doses were fatal. Their findings were confirmed by Gutiérrez-Noriega in Peru, for dogs also. J. A. F. Denyssen and D. J. Watterson (*J. ment. Sci.* 1938, 85, 1006) found that in an intact animal small doses of cardiazol increased the reflex excitability, whereas larger doses caused epileptiform convulsions, and massive doses paralysis Gutiérrez-Noriega, Rotondo, and Alarco (*An. Fac Cienc méd., Lima*, March, 1939, p. 263) divide the effects observed after the intravenous injection of cardiazol in dogs into five periods: (1) psychomotor excitation; (2) convulsions; (3) muscular inhibition and incoordination, sometimes resembling the coma that follows epileptic convulsions; (4) catatonia; and (5) recovery. In 100 experiments on 70 dogs catatonia was produced in 57 per cent. of cases, and it was also produced in 36 per cent. of experiments in 15 cats. The experimenters conclude that the catatonia was not due to the convulsions, because some of the dogs had catatonia without having had convulsions. Experiments repeated in the same dogs showed that the various reactions were always true to type for the particular dog, suggesting constitutional variation. Gutiérrez-Noriega and his colleagues conclude that cardiazol has a depressant action like that of alcohol.

STERNAL PUNCTURE

STERNAL puncture is useful for making a rapid diagnosis, especially in pernicious anæmia, pseudoleukæmia, acute leucopenic leukæmia, and aplastic anæmia,[1] but it gives little information which cannot be obtained by examining the peripheral blood Nevertheless a book by Dr Fieschi[2] is of great interest. It contains a gallery of hæmatological pictures obtained by sternal puncture, reproduced in 111 text figures and 10 beautifully coloured plates. Not only are the appearances minutely detailed for most blood diseases, but also an attempt is made to interpret them in terms of bone-marrow function. Special attention is paid to karyokinesis in normal and in pathological conditions. The ease with which sternal puncture can be performed may lead to many errors on the part of those inexperienced with myelograms Consequently sternal puncture should be regarded as only one of several diagnostic methods in blood disease; and the characteristic polymorphism of the bone-marrow needs an expert to interpret it. Another difficulty is the lack of homogeneity in the distribution of the myeloid parenchyma in all bone-marrow, even in the most homogeneous tissue of the sternal marrow. Nevertheless sternal puncture has revealed invaluable information concerning the erythroblastic reactions in secondary anæmias In the interpretation of the myelogram a qualitative analysis is insufficient; it must be quantitative to show the state of hæmopoiesis or of maturation, and the karyokinetic changes must be accurately recorded to estimate the rate of proliferation—an estimation which, however, cannot be absolute Aberrations and degenerative phenomena in karyokinesis must also be carefully observed as clues to morbid processes

CHINESE ORTHOPÆDIC CENTRE

IN our issue of July 8 (p. 99) the British Orthopædic Association appealed for help in establishing an orthopædic unit behind the Chinese lines This unit, it is hoped, will form the nucleus of an orthopædic centre which is to be established at the Emergency Medical Service Training School at Kweiyang The training hospital attached to the school would put 300 of its 1000 beds at the disposal of the unit, which would thus be able to make use of the existing organisation for the selection of cases and train the medical personnel of army hospitals in correct orthopædic procedures. Other divisions of the centre will undertake the production and fitting of appliances, the provision of physical treatment and the supervision of exercises. Suitable vocational training will be arranged for individual cases, and finally the centre will arrange with the provincial government for the settlement of each soldier after his discharge Orthopædic patients have to spend long periods waiting—between successive operations, or for the fitting of an appliance, or during a course of physical therapy—when it will not be possible to spare bed space in the hospital itself for them. At first these men will be accommodated in the Army Cripples' Home, but it is hoped shortly to complete the centre by establishing a disabled soldiers' hostel where they need no longer live under a hospital regime and more can be done for their welfare An appeal for funds for this hostel is being made by the Foreign Auxiliary to the National Red Cross Society of China

MEDICAL ABERDEEN

Dr. David Rorie compiled a singularly interesting "Book of Aberdeen" for the British Medical Association's meeting last month. Published by the executive committee of the Aberdeen division, it is printed by W. and W. Lindsay (28, Market Street) and consists of essays on the university, the medical history of the town, the medico-chirurgical society, the various hospitals, the public-health administration, the Rowett Institute and other research institutions, and the scenery, literature, historical remains, and folk-lore of the district, together with much else. Dr Rorie's chief collaborators have been Mr. Alexander Keith and Dr. G. A. G. Mitchell, but the book is a true symposium, and many doctors have contributed their quota of information and scholarship. For the medical visitor to old and new Aberdeen no better guide could be desired.

NEW MATERNITY DEPARTMENT AT NEWCASTLE.—On Aug 10 Mr J. E Scanlan opened the new maternity department of the Newcastle General Hospital. This serves to remind one that the earliest provision of hospital beds in the Newcastle workhouse was for maternity cases The new department has three sections, which between them accommodate 30 beds. Of these 22 beds are for normal cases, 5 are for patients suffering from minor degrees of sepsis, and 3 in a separate building are for "suspect" cases In the main the accommodation has been planned in single- and two-bedded wards, though there are two larger wards, each of 4 beds, and a nursery. For protection against air-raids, Dura-steel has been inserted in the ceilings of the operating-theatre and labour ward annexe and armoured glass has been used in the windows

1939 Students Guide 1940

HOW TO BECOME A DOCTOR

For thousands of years medicine has united the aims and aspirations of the best and noblest of mankind To depreciate its treasures is to discount all human endeavour and achievement as naught —Karl Marx

The branches of medicine now extend so widely that anyone of average intelligence, from the shyest bookworm to the heartiest sportsman, can find an agreeable niche in them There is almost as varied a choice of jobs inside the medical profession as outside it, and the doctor can find a use for talents as far apart as carpentry and foreign languages The candidate must give up at least five and a half years to vocational study, but in return he can count on a life full of human interest and a greater probability of a living wage than in the other professions From the day of qualification he will be able to keep himself, and he will soon be earning enough to meet all reasonable needs He *is unlikely to make a fortune, but* he *is still more unlikely to starve*

PRELIMINARY EDUCATION

It may be wise if there is a chance of a boy (or a girl) *becoming a doctor to send him to a school that offers special facilities for teaching the preliminary* scientific subjects In any case he should if possible make up his mind to take up medicine in time to pass the examinations required for entry into a medical school before he leaves This is not to say that he should begin to study the more specialised medical subjects too early A good general education is the essential basis for a good doctor, and this is the idea behind the recommendations made by the General Medical Council last year The council recommend that before a student begins his medical course proper he should be 18 and should have passed two examinations (*a*) an examination of university matriculation standard *in arts or pure* science, or in English mathematics, a foreign language, and a fourth subject chosen from geography, botany, history, science, or a classical or modern language, and (*b*) an examination in chemistry, physics, and (except for those who do their chemistry and physics at a medical school) one or two other subjects of general education at a standard higher than (*a*) The student must, of course, pass (*a*) before going to a medical school, and he may also be able to pass or gain exemption from (*b*), which will save him a year Not all schools, however, teach these scientific subjects up to university standards, and it may be better for a student to start his medical training at a medical school, so that he has a year to find his feet there on the more or less familiar ground of pure science Apart from any obligation to acquire them, a knowledge of French and German is an undoubted asset to a doctor It must be remembered too that character and ability to deal with his fellow men rather than intellectual brilliance, make for *success in medicine, and a period of residence abroad* will do more to develop these qualities than an extra year at school

CHOICE OF SCHOOL

The student should decide where he is to do his training at least a year before he intends to go there, for there is some competition for entry and he may be eligible for an entrance scholarship He must first make up his mind whether he is to aim at a *university degree or at a qualifying diploma of one* of the other examining bodies, such as the three Conjoint Boards Either of these will allow him to practise, but a degree will give him a higher professional standing, more particularly perhaps in the eyes of laymen, and will be a help later in obtaining appointments and possibly even patients A diploma, on the other hand, can be obtained in about six months less time, and, the standard being lower than that of most degrees, will appeal to the *student who* finds examinations a stumbling block Ability as an examinee should not be judged, however, purely on a school record, for boys who have been labelled *dull because school subjects did not appeal to them* often take an interest in medicine and pass their professional examinations with ease

On the whole the student will be well advised, at any rate in the first place, to aim at a degree In London the custom is to enter for the degree course (most schools now insist on this), pass the final diploma examination at the earliest opportunity, and take the degree later In this way the student will be qualified and can take resident appointments *while he is doing the last year's work* for his degree, thus gaining valuable experience, earning his keep, and saving tuition fees The possession of a conjoint *diploma also allows the* M R C P or F R C S and the Oxford M B to be taken earlier

In England the next decision to be made is whether the student will go to one of the universities that teach the preclinical subjects only—such as Oxford, Cambridge and King's College, London—for the first three *years and then on to a hospital*, to one of the provincial universities that provide a complete curriculum, or direct to a London hospital for the whole course The choice is determined by family traditions, financial considerations, including the *scholarships* available, and the student's individual ability—and often one of these is so strong that there is no choice at all, the brilliant student, for example, will go where his scholarships lead him, and in some families it may seem sacrilege not to go to Oxford

It is board and lodging rather than fees that make the medical course expensive, so that the student who must qualify as cheaply as possible should go if he can to a school near enough for him to live at home At a *London school* all professional expenses will be covered by about £100 a year, including midday meals and travelling For the 5½ years' M B course the tuition fees will be about £250, books, £20, examination fees, £32, microscope, £20, *instruments* and sundries, £25 At some of the provincial universities, and especially in Scotland and Ireland fees are lower At University College Dublin for instance, the total tuition fees amount to only £130 In London the average cost of maintenance

—board and lodging, clothes and so on—is about £150 a year, and here again the cost is often lower in the provinces and certainly in Scotland and Ireland. At Oxford and Cambridge expenses depend even more than elsewhere on the tastes of the individual, for there is more temptation to extravagance, and they also vary at different colleges; but in the ordinary way £250 a year should cover everything except keep during the vacations. The undergraduate who, apart from scholarships, has to make do with less will miss so much by being unable to take a full part in university life that he will be wiser to go elsewhere. In order to take a London M.B. degree the student who lives in lodgings must spend about £220 a year for 5½ years: some £1200 If he lives at home he may save nearly half of this A conjoint qualification will cost him about £1100 if he lives in lodgings or say £550 if he lives at home. If he goes to Oxford or Cambridge for his first three years and to a London hospital for the last three his degree will cost him about £1450; he may easily spend more.

There is much to be said for doing the first three years at a university where the medical student can mix with men reading other subjects In this way he may acquire interests outside medicine, which is bound to fill the greater part of his thoughts, and may avoid the parochialism that infects some who spend five years in one school. Others may be upset by a change of environment in the middle of training and gain from getting to know something of the hospital routine and the hospital staff before entering the wards

THE LONDON SCHOOLS

All the London schools form part of the University of London, but their students are not strictly members of the university unless they have matriculated, and a large proportion come to London to do their clinical work after spending three years at Oxford, Cambridge or other universities. There are two schools which teach the preclinical subjects only—University College and King's College; and one that teaches only the first M B subjects—Queen Mary College In general University College prepares students for University College Hospital, King's College for Charing Cross, St. George's, King's College or the Westminster Hospitals; and Queen Mary College for the London Hospital St. Bartholomew's, Guy's, St. Mary's, the Middlesex and St. Thomas's Hospitals cater for the whole curriculum, as does the Royal Free for women students Charing Cross, St George's, K C.H., the London, U.C H, Westminster and West London only take students for the clinical years

Of the thirteen hospitals St. Bartholomew's, Guy's St. Mary's and St. Thomas's have the largest schools; St. George's, Charing Cross, Westminster, and the new West London the smallest. The important consideration is, however, the proportion between the number of students in the wards and the number of hospital beds available for teaching Several schools in the past have suffered severely from overcrowding. The label of a big school may carry weight with the public and with appointment boards later, and it usually possesses greater facilities for games, acting and music, debating, and the like, whereas the small school offers more individual teaching and the charm of knowing everybody. The student of average ability and the quiet, retiring man will probably do better at a small school where there is less competition; whereas the big fish may find more scope in a big pond. A house appointment at a teaching hospital is an invaluable preliminary to any branch of practice, and it is well to inquire what proportion of students succeed in getting one and how appointments are made—whether by competitive examination or on more general worthiness, including athletic ability, and whether Oxford and Cambridge men are favoured. If a man has friends on the staff of one hospital it may be wise to go there, not because he will be favoured but because he will start by being known Finally, especially when health is a consideration, the locality of the school and of the district where the student has to live is of some importance. In his final years he will become more and more tied to the hospital and it may be neither pleasant nor prudent to bury himself in more squalor than he need.

OUTSIDE LONDON

In return for their costliness Oxford and Cambridge offer certain advantages that are not easy to define. The influence of tradition and of the college atmosphere, and the opportunities for such recreation, both athletic and social, as the curriculum leaves time for, do much to mould the character of a man at his most impressionable age The undergraduate's freedom is still restricted to a certain extent, so that he is less likely to be intoxicated by sudden liberty The friends he makes both inside and outside the profession will stand him in good stead later, as will the prestige of his degree and his "college tie" On the other hand, the medical education at Oxford and Cambridge is much criticised just now. It is said that their teaching caters only for the scholarship man, and that the average student is apt to be discouraged; that too little stress is laid on the connexion between scientific knowledge and its practical application, because the teachers are out of touch with the needs of practice The terms are too short, and they have become so filled with lectures and laboratory work that the leisure for physical and mental culture is seriously restricted The standard of the new medical tripos at Cambridge, in which the student must take second-class honours if he is to obtain his degree without loss of time, is too high and there is danger that many men will leave Cambridge with no degree at all At Oxford too the pathology course is too advanced for students with no clinical experience, and they tend to learn pathology as a separate subject divorced from clinical medicine No doubt these faults are temporary, and there is no question that these universities turn out some of the best men met with at the London schools.

As regards size the English provincial schools run the London schools closer than is generally realised Liverpool, for instance, has over 650 medical students to St. Bartholomew's 750. Durham, Birmingham and Leeds each have between 400 and 500. Their supply of clinical material is as a rule larger and more varied than in London, for in London the greater part of the vast number of beds controlled by the London County Council is not available for teaching Their opportunities for practical midwifery are also on the whole better. The greatest asset of the provincial universities is, however, one that they share to a variable extent with Oxford and Cambridge —namely, that because they are not only medical schools they help to cultivate that breadth of outlook that leads to wisdom rather than mere knowledge

Some of the provincial universities have special regulations that should be inquired into before the intending student leaves school. The Welsh National School at Cardiff, for instance, does not allow exemption from the intermediate subjects of chemistry, physics and biology on the higher school certificate

but insists on its students doing three years preclinical work in the university and taking a degree in science or arts

SCOTLAND

The medical schools of Edinburgh and Glasgow are the largest in the British Isles, Edinburgh having some 1300 students and Glasgow 1250, counting some post graduates doing special courses and occasional students The Aberdeen school is smaller, with some 475 students, and St Andrews smaller still In addition, the School of Medicine of the Royal Colleges, in Edinburgh, which prepares students mainly, though not entirely, for the Scottish and other Conjoint Board examinations, has an average of over 500 students A large proportion of Scottish students live at home, fees are low, far more bursaries and scholarships are available than elsewhere, and the Carnegie trust makes grants towards the tuition fees of Scottish students whose means are limited The student who must qualify cheaply can therefore probably do so most easily in Scotland Students no longer enter their medical school at the age of 16, which used to reduce the cost of training, though it must at the same time have reduced the standard of general education The teaching is good from the theoretical standpoint, though Edinburgh in particular is still overcrowded and its graduates suffer accordingly from lack of practical experience The Scottish student is a much freer person than the undergraduate of the Sassenach universities, and his private life is more of his own making

IRELAND

In Ireland the student has the choice of three large university schools—Trinity College and University College in Dublin, and the Queen's University in Belfast—two smaller university schools at Cork and Galway, and one non university school, that of the Royal College of Surgeons in Dublin The primary aim of all of these is to fit their students for general practice, and their teaching is therefore essentially practical They have long adopted the admirable system that dates from apprentice days whereby students spend some months as "resident pupils" in a hospital with definite duties assigned to them Fees and living expenses are low in all Irish schools, and as most Irish students have limited means there is little temptation to extravagance Of the three Dublin schools, Trinity College has a great and ancient tradition of culture, it is independent and protestant, and is slowly changing from a predominantly tory to a liberal outlook It has always had a close connexion with the services University College, which with the colleges at Cork and Galway make up the National University of Ireland, is comparatively modern, but what it lacks in tradition it makes up in youthful keenness Its connexion is more with the public services at home, and it is catholic and national The school of the Royal College of Surgeons is purely a medical school, and its students lack the intercourse of university life, but the teaching is excellent It is neither catholic nor protestant, national or otherwise The huge sum collected by the sweepstakes (nearly £14 000,000) is bound to lead to a great development in scientific medicine in Dublin, with increased opportunities of research appointments and probably paid assistantships in the hospitals

WOMEN STUDENTS

In London only three schools—the London (Royal Free Hospital) School of Medicine for Women, King's College, and University College—admit women for the preclinical years, and at all of these the competition for admission is keen, at the Royal Free there are some 200 applicants for the 60 annual vacancies Queen Mary College can now take a few women for the first M.B subjects As regards clinical work the Royal Free covers the whole curriculum, King's College and University College hospitals each take 12 women students a year, the new school at the West London is largely intended for women, and thus year has 37 women to 6 men The great majority of women who train in London, however, go to the Royal Free, either for the whole course or after having done their early years at Oxford, Cambridge, University College or elsewhere

At both Oxford and Cambridge the standard for admission to a college is higher than for men, and at Cambridge women are not yet admitted to full membership of the university, though this makes little practical difference Those who do their early years at these universities have little difficulty in finding places for their clinical work At most provincial universities women are on an equal footing with men, and at Bristol and Manchester, for instance, are well supplied with halls of residence The same applies to Scotland, where Glasgow has nearly 200 women in its medical school, and to Ireland Thus, though in London the path for women into the medical profession is narrow, elsewhere the openings for the average woman are no less wide than for a man

MILITARY SERVICE

The Government has announced that all university students may postpone their period of service with the militia until after they have finished their course, or alternatively prospective students may apply to anticipate their service as soon as they reach the age of 18, so as to fit it in before they go to the university It is now clear that this also applies to medical students, university or otherwise Few of them are likely to take advantage of the option to antedate, for it will mean a break in their work for the first M.B, nearly all will go from school to university or medical school in the normal way and on reaching the age of 20 will apply to a tribunal for exemption from military service Those already at a university or medical school will do the same Exemption will be granted for twelve months at a time and the student must apply for its renewal every year The deans of medical schools will inform the tribunals of the date on which each student should qualify, it is understood that exemption will be granted until that date, but not necessarily beyond it, so that a student who repeatedly fails in his final examination may be called up What form the training of medical militiamen will take is not yet known—the Government has two years in which to decide—but it will presumably be in association with the medical and not with the fighting services

---

". The student, once entered on his mental pursuits, must engage in them zealously, determinately, perseveringly The temptations of a luxurious city must not lure him from the sick patient, the dead body, the laboratory, or the library This is not the season for sensual indulgence He should not fear that if he fails to witness this attractive sight, or partake of that novel pleasure, no other opportunity will offer to see and feel what is delightful of the same kind Let him postpone those enjoyments of London which are foreign to his present business to a future and better season He will meet them with a higher relish, when advancing time has improved his taste and heightened the refinements of life, and they will then leave behind no sting, because he will be master of his own time and resources"—*The Lancet* Students' Number, 1839

REGISTRATION

GENERAL MEDICAL COUNCIL

THE duties of the General Council of Medical Education and Registration of the United Kingdom are fourfold First, it is responsible for registration: no one is a *legally qualified* medical practitioner until his name appears on the Medical Register. Secondly, it is a standardising body, ensuring that there is a definite minimum of medical education and examination requirements Thirdly, it is responsible for discipline within the profession and has the power to remove from the Register any practitioner convicted of a criminal offence or judged by the Council to have been guilty of infamous conduct in any professional respect Fourthly, it has the exclusive right of printing, publishing, and selling the British Pharmacopœia.

The Council consists of 39 members, of whom 18 are chosen by universities and 9 by licensing corporations; 5 members are nominated by the Crown on the advice of the Privy Council, and 7 others are elected by the members of the medical profession as direct representatives The Crown members and the university representatives need not be medical men, and one layman appointed by the Privy Council now sits on the Council. Three additional members are appointed for dental business by the Privy Council under the Dentists Act, 1921, which retained in the hands of the General Medical Council the power of erasure from the Dentists Register and the functions in regard to dental education originally conferred upon it by the principal Act of 1878.

The Educational Curriculum

The course of professional study after admission to a school of medicine as a student commencing the medical curriculum proper occupies at least five years The final examination in medicine, surgery, and midwifery must not be passed before the close of the fifth academic year of medical study.

ADMISSION TO MEDICAL SCHOOLS

Any application to be admitted to a school of medicine on beginning the medical curriculum proper should be addressed to the dean or other appropriate authority of the school to which the applicant desires to be admitted. Students are no longer registered by the General Medical Council before their admission to schools, and it rests with the authorities of schools and of licensing bodies to deal at their discretion, without further reference to the Council, with applications for admission to schools. Applications are now considered by the authorities of schools and of licensing bodies in the light of the recommendations of the Council in regard to the registration of medical students, incorporating resolutions in regard to general education and preliminary scientific subjects, which came into operation on Nov. 1st, 1938 The relevant provisions of the recommendations are as follows.

The Council recommend that, subject to such exceptions as may from time to time be allowed by the authorities of schools of medicine and of licensing bodies, every medical student, before the commencement of the medical curriculum proper, should be registered under the following conditions.

1 Before registration as a medical student every applicant should furnish evidence that he has attained, or will within three months attain, the age of 18 years.

2 Before registration as a medical student every applicant should be required to have passed—

I A recognised preliminary examination in general education

II An additional examination, or additional examinations, conducted or recognised by one of the licensing bodies

I. PRELIMINARY EXAMINATION IN GENERAL EDUCATION

3. The minimum standard of the preliminary examination in general education required of applicants should be that of a university matriculation or entrance examination in the faculties of arts or pure science. If in other faculties the examination should be of the same standard, and should include the subjects specified in section (1) of the following recommendation

4 (1) The Council have recognised as complying with the recommendations the following university examinations which admit to the faculties of arts or pure science, or, *subject to the condition specified below*, to other faculties; the matriculation examinations of the Queen's University of Belfast, the Universities of Dublin, London, Wales, and the National University of Ireland; the previous examination of the University of Cambridge; responsions at the University of Oxford; and the entrance or preliminary examination of the Scottish Universities.

The condition specified in respect of faculties other than arts or pure science is that .—

The certificate shall bear evidence that the candidate has passed, on the matriculation or entrance standard, in the following subjects, viz :—

(*a*) English; (*b*) elementary mathematics; (*c*) a language other than English; (*d*) a fourth subject to be chosen from history, geography, botany, physical science, natural science, Latin, Greek, French, German, or other language accepted by the university for the purpose of matriculation or entrance.

(2) Subject to the condition specified in section (1) of this recommendation, the Council have recognised as complying with the recommendations those of the examinations conducted by recognised authorities in Great Britain and Northern Ireland, or in Eire, which are accepted by any one or more of the universities of Great Britain and Northern Ireland, or of Eire, under the conditions prescribed by them as to "credits" or "grades," as qualifying for entrance or matriculation When a school certificate is presented, the credits in the four required subjects should have been obtained at not more than two sittings

(3) The Council will continue to recognise as complying with the recommendations certain examinations other than those which are mentioned in section (2) of this recommendation. Recognition will not be extended under this section to any examination unless the Council are satisfied (*a*) that in scope and standard it is equivalent to a recognised matriculation or entrance examination of a university of Great Britain and Northern Ireland, or of Eire; (*b*) that it fulfils the condition specified in section (1) of this recommendation, and (*c*) that the examination has been completed at not more than two sittings The examinations so recognised are: the College of Preceptors (England), senior certificate (with credit); the Educational Institute of Scotland, preliminary medical certificate; Irish Royal Colleges of Physicians and Surgeons, preliminary examination in general education

(4) Subject to the condition specified in section (1) of this recommendation, the Council will recognise as

complying with the recommendations such examinations of universities in British India, in British Dominions other than Eire (with respect to which provision is made in the foregoing sections), in British Colonies, and in foreign countries, as are accepted by any one or more of the universities of Great Britain and Northern Ireland, or of Eire, as qualifying for entrance or matriculation

II ADDITIONAL EXAMINATION OR EXAMINATIONS

5 The subjects and scope of the additional examination or examinations which applicants should be required by the licensing bodies to have passed before registration as medical students are as follows —

(1) For all applicants, chemistry (theoretical and practical) the elementary principles of general and physical chemistry, and of the chemical combination of elements, including carbon

(2) For all applicants, physics (theoretical and practical) the elementary mechanics of solids and fluids, the elements of heat, light, sound, electricity, and magnetism

(3) For applicants who have received their instruction in chemistry and physics before entering universities, university colleges, or medical schools, one or two subjects of general education other than chemistry, physics, or biology, at a standard higher than that of the recognised preliminary examination in general education

The standard of the additional examination in a subject or subjects of general education should be approximately that required in a subsidiary subject offered for the higher school certificate at the examinations specified in section (2) of the previous recommendation

Note—It should be open to applicants to offer themselves for examination in the subject of biology either before or after they are registered as medical students

Medical Registration in Ireland

By legislative agreement between the Governments of Great Britain, of Eire, and of Northern Ireland, the powers and duties of the General Medical Council are continued as heretofore in respect of qualifying bodies in Eire and of medical practitioners qualified in Eire and registered by the Council Side by side with this a Medical Council has been set up in Eire with the duty of establishing and controlling a Register for Eire Practitioners whose names are on the Register kept by the General Council and persons who pass a qualifying examination in Eire, are entitled to registration in the Register of Eire on payment of the prescribed fee The Medical Council of Eire have, over those whose names are on the Register kept by them, the same disciplinary powers as are possessed by the General Council over those whose names are on the Register kept by that body To possess the privileges of a qualified practitioner in Eire it is necessary to be registered in the Register for Eire

The net result of the change in the law as regards the practitioner qualifying in Eire in the future is that (1) if he intends to practise only in Eire he need only register in the Register for Eire, (2) if he intends to practise in Great Britain or Northern Ireland he will register in the Register kept by the General Medical Council, and (3) if he is in doubt where he will practise he will register in both Registers He will, as he registers in one Register, or in both Registers put *himself* under the disciplinary control of the one council or of both councils No practical inconvenience is caused, and practitioners qualified in Eire in future will not find themselves deprived of any former privileges or rights

DENTAL BOARD OF THE UNITED KINGDOM

Anyone who is on the Medical Register is entitled to practise as a dentist, although he cannot register as such without a degree or licence in dentistry, but it is a distinct advantage to take a special dental qualification, otherwise few dental appointments at general or special hospitals or dispensaries are available, and, under the National Health Insurance (Dental Benefit) Regulations, a registered medical practitioner cannot give dental treatment to insured persons as an additional benefit unless he is registered in the Dentists Register

Under the Dentists Act, 1921, substantial parts of the functions of the General Medical Council under the Dentists Act, 1878, and under the Medical Act, 1886, which related to the keeping of the Dentists Register and the administration of the Dentists Acts were transferred to the Dental Board of the United Kingdom As stated above, the power to erase a name from the Dentists Register remains with the Council, but the inquiry into disciplinary cases rests with the Board, who forward their reports and findings to the Council

The Dental Board consists of a chairman and 12 members The chairman is appointed by the Privy Council Other members of the Board are appointed by the Minister of Health, the Department of Health for Scotland, the Governor of Northern Ireland, and the General Medical Council (3), four members are elected as representatives by the dentists possessing degrees or licences in dental surgery or dentistry, and practising in England and Wales, Scotland, and Ireland, and two by dentists registered under the Dentists Act, 1921

ADMISSION TO DENTAL SCHOOLS

Any application to be admitted to a school of dentistry on beginning the dental curriculum proper should be addressed to the dean or other appropriate authority of the school to which the applicant desires to be admitted Students are no longer registered by the General Medical Council before their admission to schools, and it rests with the authorities of schools and of licensing bodies to deal at their discretion, without further reference to the Council, with applications for admission to schools Applications are now considered by the authorities of schools and of licensing bodies in the light of the recommendations of the Council which came into operation on Nov 1st, 1938, and of the recommendations of the Council as to the course of study and examinations to be required of candidates for licences in dentistry or dental surgery which came into operation on Oct 2nd, 1933, and were amended by the Council on May 24th, 1938, so as to bring them into harmony with the recommendations in regard to the registration of students

The relevant provisions of the recommendations as to the course of study and examinations to be required of candidates for qualifications in dentistry are as follows —

1 That, subject to such exceptions as may from time to time be allowed by the authorities of schools of dentistry and of licensing bodies, every dental student at the commencement of his studentship should be registered in the same manner as a medical student, and under the same conditions with respect to age, preliminary examination in general education, and additional examination or examinations, provided that it should be open to applicants for registration as dental students

to commence professional study either at a recognised dental hospital or school or as pupils of a registered dental practitioner.

2. That, with respect to applicants who have served an apprenticeship in dental mechanics, an applicant who has served two or more years subsequent to his attaining the age of 17 as a bona-fide apprentice in dental mechanics with a registered dental practitioner should, if the licensing bodies think fit, be allowed to antedate his registration for a period not exceeding six months

3 That before registration as a dental student every applicant should furnish evidence that he has attained, or will within three months attain, the age of 18 years.

4. That before registration as a dental student every applicant should be required to have passed (*a*) a recognised preliminary examination in general education, which should be the same as that required for medical students; (*b*) an additional examination, or additional examinations, conducted or recognised by one of the licensing bodies, which should be the same as the examination or examinations required for medical students

Candidates for a diploma in dental surgery should produce certificates of having been engaged for at least four years in professional studies, and of having received during 24 calendar months practical instruction in dental mechanics It is recommended that instruction in dental mechanics be taken at a recognised dental hospital and school. If any part of such instruction be taken by the candidate as a pupil with a registered dental practitioner, the time required to be devoted to it shall be at least twice the time required for the corresponding instruction taken at a dental school.

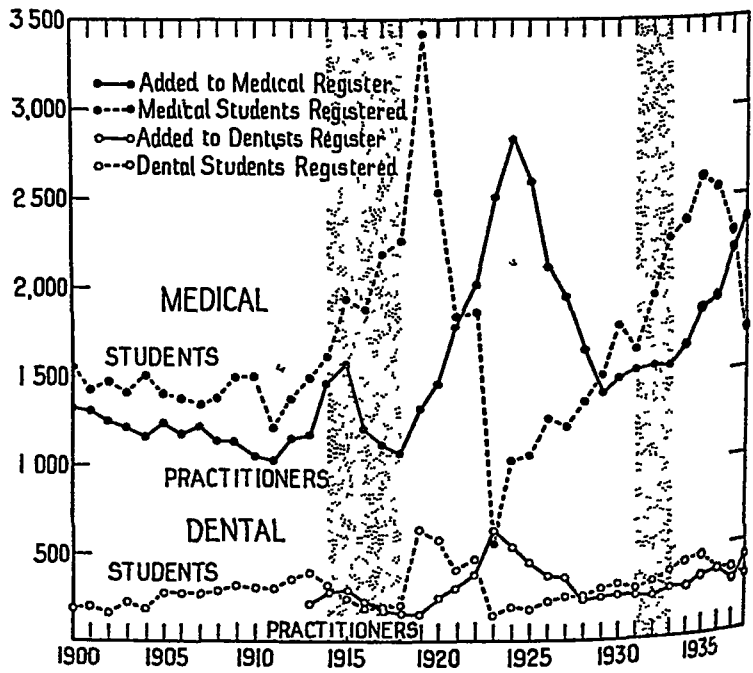
THE NUMBERS WHO ENTER

No-one knows exactly how many medical students there are at the present moment For many years past the General Medical Council has published a list of medical and dental students registered during the previous year and from this list we have prepared the accompanying graph; but the list has admittedly never been complete. There was no legal obligation on the medical student to register; whether he did so or not depended on the custom of his particular school Now the custom has changed. Last year the G.M C decided to give up direct registration and to print instead the names of students reported as having been admitted to the various schools of medicine or dentistry, the period chosen being no longer the calendar year but an academic year beginning Sept. 1. The first students' register in its new form is to appear next month and by the courtesy of the registrar we are able to state that it will contain the names of about 1735 medical students and 315 dental students Internal evidence suggests that whereas the dental list may be complete the medical list may be short by 400 or 500 names. For this reason it would be unwise to draw any deductions from the apparent continuance of the sharp fall in the number of medical students which began in 1935. It may, however, be regarded as certain that this year the number of medical qualifications has exceeded the number of student entries, as it did in the period 1922–29 when there was a trough in the student entry following the colossal peak of 1919–20. The last twenty-five years have now shown two complete oscillations, with a return to near the pre-war norm. No doubt various factors have contributed to their causation, the most important being war conditions and bad trade—both of which act, in different degree, as a spur to medical recruiting

In drawing conclusions from the registers on qualification[1] we are on safer ground. The number of names added to the Medical Register last year was 2365, being 151 more than the figure of the previous year. The rising curve is not so sharp and the summit is probably in sight. Taken by regions, most of the increased medical registration was in England (154) and Ireland (56), while there was a drop of 3 in Scotland and a plus of only 4 in the colonial section. Only the foreign section contains any surprise, with 53 names against an average of 12 for the last twenty years. The total number of names on the Medical Register on Jan 1 was 61,420, being 257 more than last year.

The Dentists Register also shows a substantial plus of entries (408), being the highest number in the decade except for 470 in 1936; but here we have to reckon during the last three years with a large increase in the foreign list, which fell to the modest number of 15 in 1938. Taking British alone, the increase of 384 was almost without record, the number only having been exceeded during the transitional period 1923–25.

1 The Medical Register for 1939 (21*s*), The Dentists Register for 1939 (12*s*): both published for the General Medical Council by Constable and Co



MEDICAL SCHOOLS OF ENGLAND AND WALES

UNIVERSITY OF OXFORD

THOUGH the Oxford faculty is the oldest in the kingdom, systematic university teaching for students of medicine only really began in 1883, when Burdon-Sanderson came from University College, London, to be the first Waynflete professor of physiology From that date onwards there was a steady increase in the provisions for teaching and for the conduct of original investigation, the rate of this increase has in recent years been accelerated by benefactions from the Sir William Dunn Trust to the departments of pharmacology and pathology and from the Rockefeller Foundation to the department of biochemistry, and later by the opening of the Nuffield Institute for Medical Research, followed by Lord Nuffield's munificent further gift of £2,000,000 for the benefit of the medical school The Nuffield professors and their assistants are now at work and the facilities for teaching and research, in both the preclinical and clinical departments, are being considerably strengthened On the other hand, Oxford does not wish to increase the number of its medical students and it is not intended that the average student should complete his clinical work in Oxford The number of medical students of both sexes now in residence in Oxford is about 240, and approximately the same number is engaged in clinical work for the second B M in hospitals elsewhere

At school, apart from acquiring knowledge, the prospective medical student should train himself to think clearly and to write clearly, he is also well advised to learn those languages, in particular German, which will be of use to him in his future reading

Before he can become a member of the university a student has to be accepted by a college or by one of the non-collegiate bodies This normally involves the taking of a college entrance examination, but exemption may be gained on the result of a college scholarship examination or in other ways Next he has to pass, or obtain exemption from, the university entrance examination, responsions, in which Latin is compulsory

He then normally takes the preliminary examinations in physics and chemistry, and in biology These he can attempt before he comes into residence, and it is an advantage to him so to do These examinations satisfy simultaneously the preliminary requirements, both of the university in respect of the B A degree in animal physiology, and also of the General Medical Council in respect of medical qualification

The next step is the examination in organic chemistry for first B M Exemption can only be claimed by those who have passed certain examinations in chemistry of the university A man who has passed the preliminary examinations before coming into residence normally takes organic chemistry in his first term, and thereafter prepares for the examinations in human anatomy and physiology for first B M, which he will probably take in his sixth term He must pass simultaneously in both anatomy and physiology, unless he has previously been placed in the first or second class in the final honours school of animal physiology, in which case he is exempted from the physiology part of first B M Nothing else can exempt him from the examination in this subject, and there is no exemption at all from that in human anatomy

Practically every medical student attempts to obtain the B.A degree by taking the final honours school of animal physiology, for this course diverts him least from purely professional work The special course in preparation for it lasts one year, and the examination may not usually be taken earlier than the eighth term of residence

The student who has passed his preliminary examinations before coming into residence should thus have passed the examinations for first B M, and for the degree of B A, by the end of his third

year He must thereafter prepare for the examinations for second B M The subjects of these are at present materia medica and pharmacology, pathology, forensic medicine and public health, medicine, surgery, and midwifery At a future date, however, the pathology will become general pathology and bacteriology and special pathology will be included in medicine, surgery, and midwifery In addition, materia medica and pharmacology will become pharmacology and the principles of therapeutics The examinations in the three first-mentioned subjects can be taken separately, but a student must pass simultaneously in the last three The examination in these may not be taken, unless the candidate is already a registered medical practitioner, until the eighteenth term from matriculation and the lapse of at least 33 months from the date of passing the examinations for first B M

The whole of the work for second B M may be done in recognised institutions away from Oxford—e g, the London medical schools Alternatively, a student who has the necessary qualifications may spend the first 6 months in Oxford, during which time he receives instruction in general pathology, bacteriology, pharmacology and elementary medicine and surgery, and thereafter do a further 27 months' work elsewhere

Further details about the qualifying and higher medical and surgical degrees are to be found in the "University of Oxford Examination Statutes," and in a pamphlet entitled "Information concerning the School of Medicine &c.," both of which can be obtained from the Clarendon Press, Oxford Questions about entries for or exemption from responsions and the preliminary examinations should be addressed to the college authorities, though the dean of the medical school, the Museum, Oxford, will also give any assistance that is within his power.

College entrance scholarships are advertised each summer in special numbers of the *University Gazette*, which can be bought for a few pence through any bookseller. In addition, many valuable prizes, scholarships, and fellowships are awarded, details of which can be found in the Oxford University calendar.

It is very difficult to give an estimate of the expense of that part of the course which is passed in Oxford, as it varies very much in different colleges. The amount paid by the average student is about £80 a term, but many manage on less than this

The Radcliffe Infirmary

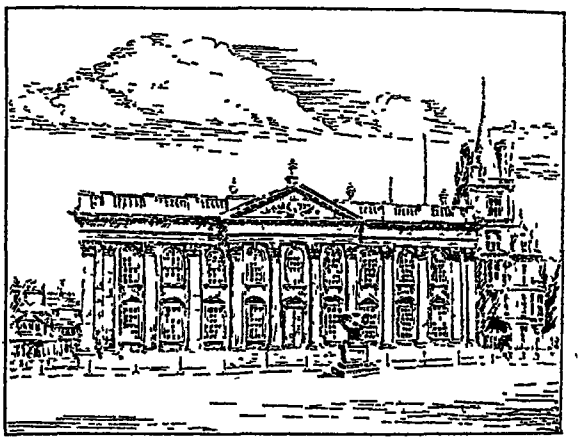
There are 506 beds, including 52 in the tuberculosis sanatorium and 30 in the recovery home Students preparing for the first B M examination receive instruction from the May reader in medicine at the infirmary in the clinical application of anatomy and physiology From September to March there is an annual six months' course in elementary medicine and surgery for students who have passed the first B M. and have qualified for the degree of B A. This course is associated with classes in pathology and pharmacology. Post-graduate courses are given twice yearly for panel practitioners under the Ministry of Health As a result of the Nuffield Benefaction departments of medicine, surgery, obstetrics and gynæcology, and anæsthetics have been established and the department of pathology and biochemistry is undergoing extension.

UNIVERSITY OF CAMBRIDGE

The University is a corporation which arranges facilities for study and confers degrees. The colleges, of which there are 17, are corporations distinct from the University, possessing and managing their own property, and for nearly all purposes independent of University control About 200 medical students enter the University every year Women are not admitted to membership but are instructed and examined by the University and may receive any of the degrees and diplomas open to men Before a student can begin his studies he must become a member of a college or of an approved foundation (Selwyn), or be entered as a non-collegiate student of Fitzwilliam House Application for membership of a college must be made to the senior tutor or head of the college Before admission the candidate must pass or obtain exemption from the previous examination and the college entrance examination, and most colleges require medical students to have passed or gained exemption from three or more parts of the first M B examination Application for admission should be made a considerable time beforehand

Cost of living varies greatly according to the tastes and means of the individual student, and the college of which he is a member. The average annual expenditure is about £300 Medical studies are endowed by the numerous natural science scholarships and prizes in ancillary subjects at the various colleges, information about which can be obtained from the respective tutors. Some of these are entrance scholarships and some are gained by students already in residence Mention may be made of the Tancred studentships in physic, tenable at Gonville and Caius College, the value of which is about £100 a year for 3 years.

After fulfilling college and University requirements the student is matriculated, that is, his name is enrolled on the register of the University. He must thereafter keep three academical years. The academical year begins in October and consists of three terms of about 8 weeks each. Medical students may also be required to be in residence for 6 weeks



(July and part of August) during the long vacation. A medical student cannot take his final examination until the eighteenth term after matriculating, which means that 6 years' study is required for a Cambridge medical degree

A student cannot obtain a medical degree unless he obtains honours in a tripos. Though a medical student may take any tripos almost all take the natural sciences tripos, Part 1. In this the student has to take three whole subjects or two whole subjects and two half subjects Considerable choice is allowed but the medical student usually takes anatomy and physiology as whole subjects because, if he reaches the standard required for medical degrees, he is exempt from further examination in these subjects. If he obtains honours but does not reach the standard required for medical degrees he has subsequently to take the qualifying examinations in anatomy and physiology. The half subjects most usually chosen are biochemistry and pathology, both of which are of great practical use later on.

It is possible for a student who has passed the first M.B before coming into residence to complete Part 1 of the natural sciences tripos in two years, and in that case he can take Part 2 in his third year. This entails a year's special study of one subject, the subjects most usually taken being anatomy, biochemistry, pathology, and physiology. During his time in Cambridge the student should also attend a course in pharmacology and pass the examination in that subject.

On leaving Cambridge the student proceeds to one of the recognised hospitals. It has always been the custom for students to seek clinical instruction away from Cambridge. At one time it seemed likely that a medical school for undergraduate clinical teaching might be established at Addenbrooke's Hospital, but the large number of students and the limited accommodation at the hospital have made that impossible, though a department of medicine has now been established which is making use of the material available at the hospital for clinical research and the training of young doctors in the methods of research

The final examination for medical degrees is in two parts: (1) surgery, including special pathology,

and midwifery and gynæcology, and (2) physic, pathology and pharmacology The examinations are partly in writing, partly oral, and partly practical Before sitting for Part 2 the student must have done two years and nine months of medical and surgical practice at one or more recognised hospitals and must have attended certain special courses The thesis which was formerly required for the M B degree has now been abolished and the student can proceed to the degree immediately after passing the final examination

Higher degrees—The degree of *Doctor of Medicine* may be taken by a graduate of the University of 8 years' standing who has passed the final M B examination An Act has to be kept, consisting of an original thesis with viva voce examination In some cases an examination is required in the field of medicine within which the thesis falls

Candidates for the degree of *Master of Surgery* who are Masters of Arts may be admitted to the examination after they have become legally qualified to practise Others may be admitted two years after they have completed all that is required of candidates for the degree of M B Candidates are required to pass an examination in surgery, surgical anatomy and operations, and pathology. The examination is held in February

Copies of the regulations and schedules of the range of the examinations may be obtained from the Registrary, the Registry, Cambridge Detailed information with regard to colleges, fees, and scholarships is given in "The Student's Handbook to the University and Colleges of Cambridge," published by the Cambridge University Press, price 7*s* 6*d*.

Addenbrooke's Hospital

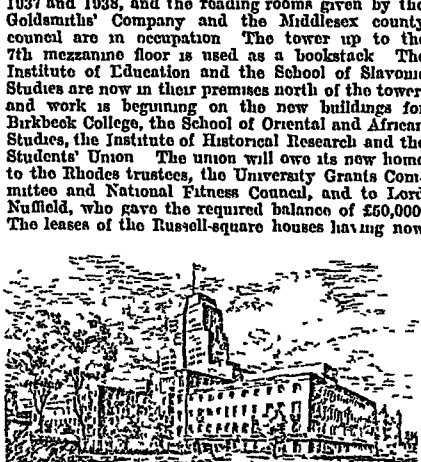
A department of medicine has now been established in the University with the reader in medicine and a group of whole time qualified research students working under the direction of the regius professor of physic The visiting staff of Addenbrooke's Hospital coöperate closely and afford full facilities for clinical study and research The work of the research unit is carried out in the medical wards of the hospital and in laboratories which have been allotted in the department of pathology Lectures and practical instruction in medicine are given by the regius professor and members of the medical staff to certain groups of senior students A few illustrative clinical lectures and demonstrations are also given to students taking the physiology course, and in the summer a course of lectures and demonstrations in applied pharmacology is given by the medical staff Regular staff rounds are held in the hospital, but there is no routine system of undergraduate clinical teaching It is open, however, to individual students to attend the ward rounds and out patient sessions of the physicians and surgeons by special arrangement Fortnightly clinical conferences in the evening are organised by the department of medicine, these are open to graduates, research students, and senior students in all the departments of the faculty

Fortnightly post graduate courses for general practitioners arranged by the Ministry of Health are held each year

The hospital has 316 beds, with the following resident staff Resident surgical officer; house physicians (2); general house surgeons (2), house surgeon to the special departments, resident anæsthetist and casualty officer

UNIVERSITY OF LONDON

Before the war a Royal Commission presided over by Lord Haldane reported that the University should have for its headquarters "permanent buildings appropriate in design to its dignity and importance, adequate in extent and specially constructed for its purpose, situated conveniently for the work it has to do, bearing its name and under its control" Attempts to acquire a site for the University were at first unlucky In 1912 a considerable sum was raised for the purpose but the scheme fell through, and when the Government offered the Senate the present Bloomsbury site in 1920 on condition that King's College moved from its position in the Strand, the authorities of King's College were unable to agree to the proposal and the offer lapsed In 1927, however, with the help of a gift of £400,000 from the Rockefeller Foundation, the Senate were able to purchase the ten-and-a half acre site to the north of the British Museum free of any conditions The foundation-stone was laid by H M King George V in 1933 and the Senate House was sufficiently advanced in 1936 for the administrative staff to be transferred during the long vacation The tower (210 ft high) was next completed and the flagstaff erected in July, 1937 The library was moved by stages in 1937 and 1938, and the reading rooms given by the Goldsmiths' Company and the Middlesex county council are in occupation The tower up to the 7th mezzanine floor is used as a bookstack The Institute of Education and the School of Slavonic Studies are now in their premises north of the tower, and work is beginning on the new buildings for Birkbeck College, the School of Oriental and African Studies, the Institute of Historical Research and the Students' Union The union will owe its new home to the Rhodes trustees, the University Grants Committee and National Fitness Council, and to Lord Nuffield, who gave the required balance of £50,000 The leases of the Russell-square houses having now



fallen in the site is being cleared for the ceremonial hall, for which the University will be indebted to the City corporation and most of the City companies, whose benefactions are to be commemorated by the display of their arms

All the metropolitan medical schools are constituent colleges while clinical units have been established at St Bartholomew's the London, St Mary's, St Thomas's, University College Hospital, and the Royal Free

The summary given below applies to the revised regulations for examinations to be held in 1940

Internal and external students—All the examinations of this University are open to men and women alike Matriculated students may be either internal

or external. Internal students are students who are registered as pursuing a prescribed course of study, or an approved course of research, in a school or under teachers of the University. Centres for preliminary and intermediate medical studies have been established at University and King's Colleges. External students in addition to matriculating must register as preparing for an examination leading to a degree or diploma within the purview of the council for external students.

Medical students of the University of London who are pursuing their medical curriculum in the metropolis will proceed to one of the recognised medical schools connected with the University described in detail in the next section. Students of St. George's, Charing Cross, and Westminster Hospitals take their preliminary and intermediate medical studies at King's College Students of the London Hospital usually attend Queen Mary College for the subjects of their first medical examination. Various schools and hospitals are also recognised as schools of the University in special departments, and students may pursue their studies at other approved universities and medical schools

The faculty of medicine of the University grants the joint degrees of M.B , B.S (*Bachelor of Medicine and Surgery*), the higher separate degrees of M D. (*Doctor of Medicine*) and M.S. (*Master of Surgery*), and the degree of B.D S (*Bachelor of Dental Surgery*) and the degree of B.Pharm. (*Bachelor of Pharmacy*); the two higher degrees are open only to candidates holding the M.B , B.S. degrees of the University. The curriculum for the M.B., B.S degrees is five-and-a-half years from the time of matriculation, with certain exceptions which must be looked for in the official regulations of the University.

A revision of the medical curriculum has recently been carried out in view of a report submitted to the Senate by a conference of representatives nominated by the Universities of Oxford, Cambridge, and London, the English Royal Colleges, and the Society of Apothecaries.

A. *Internal students.*—For the Bachelor's degrees in medicine and surgery a student must normally, after registration as an internal student, have: (1) attended prescribed courses of study for five-and-a-half years in one or more schools of the University; (2) passed the following examinations, under the conditions mentioned below: (*a*) the first examination for medical degrees in inorganic chemistry, physics, including mechanics, and general biology; (*b*) the second examination for medical degrees in anatomy and physiology (including organic chemistry, biochemistry, and pharmacology); (*c*) the third examination for medical degrees, or M.B., B S. examination in medicine, surgery, obstetrics and gynæcology, pathology, hygiene, forensic medicine, and applied pharmacology and therapeutics

B. *External students.*—For the Bachelor's degrees in medicine and surgery an external student must (1) have passed the matriculation examination or have been exempted therefrom not less than five-and-a-half years previously; (2) have passed subsequent examinations similar to those required of an internal student; and (3) have been engaged in professional studies during the five-and-a-half years subsequently to matriculation and four-and-a-half years subsequently to passing the first examination for medical degrees at one or more of the medical institutions or schools recognised by this University for the purpose, one year at least of the four-and-a-half years to have been spent in one or more recognised institutions or schools in the United Kingdom.

Doctor of Medicine.—Candidates may present themselves for examination in one of the following branches—namely: (1) medicine; (2) pathology; (3) psychological medicine; (4) midwifery and diseases of women; (5) hygiene; and (6) tropical medicine. Any candidate may transmit to the registrar a thesis for approval and may be exempted from a part or from the whole of the written examination, and in the case of Branch II (pathology) also from the practical examination.

Master of Surgery.—The examination for the degree of mastery of surgery takes place twice in each year: (1) surgery; (2) dental surgery; (3) ophthalmology; (4) laryngology, otology, and rhinology. A thesis may be submitted as for M.D.

Doctor of Philosophy —A degree of Ph D. has been instituted in non-clinical subjects for internal and external students in the faculty of medicine Candidates for this degree must hold, in a branch of study akin to that in which they propose to proceed to the Ph D. degree, the degree of M.B., B S , or B.D.S , or B.Pharm , or B Sc.

Bachelor of Pharmacy.—This is a three years' course

Full details of the prescribed curricula can be obtained free on application to the academic registrar, University of London, the Senate House, W.C.1

University College

University College is a University centre for the teaching of medical sciences. The College faculty of medical sciences comprises the departments of physics, chemistry, botany and zoology (the preliminary medical sciences); also the departments of anatomy and embryology, physiology, biochemistry, and pharmacology (the intermediate medical sciences). Post-graduate and research work is undertaken in all departments. The completion of the building scheme by the erection of the section for anatomy, histology, and embryology, together with further extensions to the department of physiology, biochemistry, biophysics, and pharmacology, and the provision of new accommodation for the department of zoology, which the generosity of the Rockefeller Foundation made possible, provides exceptional facilities for research and post-graduate study. Arrangements exist for the close correlation of the work of the faculty with University College Hospital and medical school. The number of medical students is now 280, including 67 women students.

Scholarships —The first four items on the present list provide a complete intermediate course at University College, and, in the case of (*a*), the later clinical stages at University College Hospital. The money value and subjects at examinations are as follows: (*a*) Bucknill scholarship, £42 a year for five years, (*b*) and (*c*) two entrance exhibitions of £30 a year for two years, in chemistry, physics, biology, and an English essay; (*d*) entrance scholarship, £45 a year for two years, (*e*) Ferriere scholarship, £25 for three years, tenable at University College Hospital medical school, awarded to a student who has done his anatomy and physiology at University College and has completed the 2nd medical examination; (*f*) Sharpey physiological scholarship, about £112 a year (renewable); (*g*) Bayliss-Starling scholarship, £130 a year, in physiology and biochemistry; (*h*) two anatomy and/or physiology scholarships of the total value of £100 to enable students to spend an additional year at college in order to proceed to the B Sc degree; (*i*) Morris bursary for sons of deceased professional men, tenable for two years, £20 a year.

Composition fees —Course for first examination for medical degrees, 38 guineas; for second examination, 80 guineas (payable in two equal instalments). These

fees include the subscription to the University union society

For further information apply to the secretary, University College, Gower-street, London, W C 1

King's College

The medical faculty at this College of the University gives instruction in the subjects of medical science for all the usual premedical and intermediate examinations in medicine, surgery, and dentistry Through the four associated hospitals, students of the College have clinical facility of over 1000 beds

The medical faculty of the College, admitting approximately 120 new students each year, provides a general university education in touch with other faculties, whose classes medical students are permitted to attend There are many college societies, clubs, and functions, in which students of all faculties have opportunity of meeting each other, and the college athletic ground at Mitcham, with a new and well equipped pavilion, gives excellent facilities for all kinds of sport Inter-faculty competitions are a regular feature in the sporting life at the College

The first year subjects are taught in the large departments of the faculty of science and those for the second and third years in the new medical department, consisting of the Hambleden department of anatomy and an extension to the department of physiology, built at a total cost of £70,000 These new buildings and others of recent years provide the College with a completely new and modern medical department which embodies the newest ideas in laboratory construction and equipment Special facilities are given for taking science degrees in association with medical degrees, as is done in the universities of Oxford and Cambridge

Scholarships and prizes—Two Warneford entrance scholarships of £30 each for four years in divinity, English essay, classics, or science One Sambrooke scholarship of £30 for three years in English essay, classics, or science Worsley scholarships £100 in five annual instalments of £20 *At the end of the first year* of study, one Warneford scholarship of £30 for four years, subjects as for first M B plus divinity; the Rabbeth scholarships (£30 and £15) *At the end of the third year* students may sit for the several scholarships offered by each of the associated hospital medical schools Various prizes are awarded by the College to the best third year students The Layton and the Berridge research studentships (£150 and £100 per annum respectively) and the Daniell scholarship in chemistry (£40) are also open to students of this faculty

Fees—First M B or premedical, £40 per annum, second M B or first conjoint, £14 per annum, dental course, 60 guineas per annum, anatomy and physiology only for L D S, £23 2s per annum

For further information apply to the dean of the medical faculty, King's College, Strand, W C 2

Queen Mary College

In 1917 a working arrangement was come to between the Governors of the London Hospital Medical College and Queen Mary College (East London College as it then was) by which the latter undertook to provide instruction in the first M B and pre-medical subjects for the London Hospital The College (which had already been recognised as a School of the University of London in arts, science, and engineering since 1907) then included a faculty of medicine in its activities

Facilities for teaching physics, chemistry, and botany (plant biology) in both lecture rooms and laboratories were already in existence, but accommodation for zoology (animal biology) had to be provided This department is now housed in the third floor of the new west block which has recently been added (at a cost of £40,000) as part of the scheme for modernising the College buildings A new junior chemistry laboratory has also been added at the top of the chemistry block, and when the rearrangement of the physics department follows as the next part of the scheme the junior physics laboratory will be remodelled

The College, therefore, has now specially designed and well equipped lecture rooms and laboratories for students reading for the first M B London, the premedical examination of the Conjoint Board, and, if required, for the first M B examination of Cambridge University Although the majority of the students attending the College have been accepted for admission to the London Hospital Medical College students going to other medical schools will be admitted The number of medical students for the past five years has averaged just under 50 The College is now in a position to receive more, including women

At South Woodford the College has two Halls of Residence, Elmhurst for men and Lynden Hall for women Two years ago Dytchleys, an early Georgian manor house near Brentwood, was opened as the College club-house The house provides living rooms and common rooms for staff and students, changing-rooms, and a badminton court, and the 55 acre grounds provide ample playing fields

Fees—First M B and premedical (per session): for four subjects, £31 12s, for three subjects, £27 2s, for two subjects, £20 2s, for one subject, £12 First term revision medical course (per term) for four subjects, £16 4s, for three subjects, £13 4s, for two subjects, £9 14s, for one subject, £6

There are unfortunately no entrance scholarships for medical students at Queen Mary College, although there are scholarships for those going on from there to the London Hospital

A copy of the prospectus may be obtained post free from the registrar, and the dean for medical students will be pleased to see prospective students and advise them upon their courses of study

---

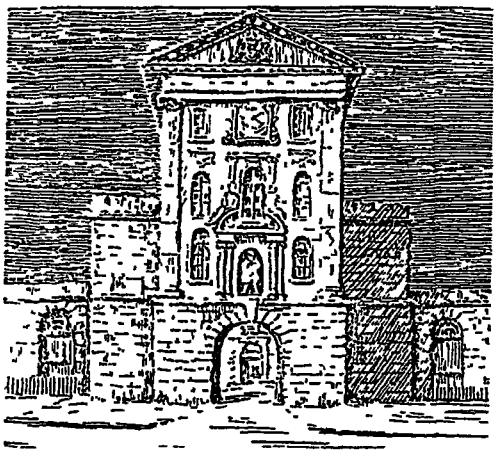
MEDICAL SCHOOLS OF THE UNIVERSITY OF LONDON

(*A map of the medical student's London appears on p 547*)

St Bartholomew's Hospital

The hospital was founded on its present site in West Smithfield by Rahere in 1123 in fulfilment of a vow he made in Rome during an illness, and the charter which he obtained from Henry II is still in excellent preservation. The hospital remained under monastic control until 1547 when Henry VIII took over its revenues, only to return them to the City of London three years later with a new charter. Students were attending the hospital in 1662, and in 1720 the governors provided them with a library, a museum, and a dissecting room By 1765 Percival Pott was delivering lectures on surgery (to John Hunter among others) and William Pitcairn on medicine The members of the staff at that time had their own private schools but about 1830 John Abernethy, whose fame as a teacher had attracted a large body of students including Benjamin Brodie and the poet Shelley, persuaded his colleagues to pool their resources In 1843 a residential college was

provided, and in 1870 the present school was built. In 1933 the medical college, which had obtained a charter of its own in 1921, acquired the site of the Merchant Taylors School in Charterhouse-square and the preclinical subjects have since been taught there.



The medical college now has about 750 students. It is hoped to build a students' hostel at Charterhouse-square when funds are available, but in the meantime the college uses the University Hostel, Connaught Hall, in Torrington-square, and the majority of students live in lodgings, mainly in Bloomsbury and Hampstead. The Students' Union, which incorporates the various games and other clubs, has common rooms and dining-rooms, a fives court, and a miniature rifle range at the hospital, and at Charterhouse-square there are squash courts, fives courts, cricket nets, and the college hall which is used for dinners, dances, and the like. The college has an athletic ground at Foxbury, near Chislehurst, with three rugby pitches, an association football and a hockey pitch, tennis-courts, and cricket pitches.

Students are admitted in October, January, or April, but the first is the best date. The school covers the whole medical curriculum, but students may enter (1) for the full course, (2) after passing an examination in chemistry, physics, and biology, or (3) for clinical work only. For stage (1) they must have passed the London University matriculation examination or its equivalent

Fees.—Entrance fee, £15 15*s*. Composition fees: (1) For full course, £231, or five instalments of £50 8*s*. (2) For those entering after passing the first examination, £199, or four instalments of £54 12*s*. (3) For those entering only for clinical work, £131 5*s*., or three instalments of £47 5*s*. Students' Union subscription, £21, or £12 12*s*. for those entering for clinical work only. Extra expenses: dissection, £3 10*s*., fever, £3 3*s*.; operative surgery, £4 4*s*.

Entrance scholarships.—(1) Combined scholarships, in association with Guy's and St Thomas's Hospitals, open to students who have passed in anatomy and physiology at a British university: (*a*) scholarship providing free medical education for three years; (*b*) exhibition of £60 in any two of the following: human anatomy and embryology, physiology, pathology and bacteriology, biochemistry. (2) Shuter scholarship of £50, in anatomy and physiology, open to Cambridge graduates. (3) Science scholarship of £100 in chemistry, physics, or biology. (4) Arts scholarships: (*a*) in mathematics; Latin or Greek or French or German, or chemistry or physics, value £100; (*b*) Jeaffreson exhibition, value £60, in the same subjects. (5) Helen Cave memorial scholarship in arts, value about £200, open to sons of medical practitioners.

Other scholarships.—There are scholarships open to undergraduates at various stages of their career to the value of about £500, and two B.Sc. scholarships of £50 with remission of fees for one year. In addition there are numerous research scholarships for post-graduates in medicine, surgery, pathology, and anatomy.

St. Bart's Hospital contains 845 beds, including 70 at the Alexandra Hospital at Swanley for surgical tuberculosis and orthopædic cases, and use is made of the City of London Maternity Hospital for obstetric work and the L C C hospitals for extra midwifery beds and for special courses of teaching. A hundred beds are set aside for medical and surgical professorial units under whole-time officers, who are also provided with laboratories for research

Non-resident appointments.—There are 44 six month appointments in the out-patient departments, paid at the rate of £80 per annum.

Resident appointments.—There are 21 resident appointments for six months, paid at the rate of £80 per annum, with board and lodging.

Clinical assistantships.—A large number of these are appointed for three months to the various departments

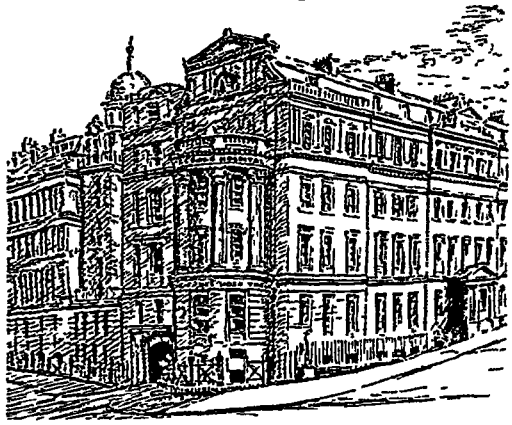
Demonstratorships.—Demonstrators are appointed in the college in biology, chemistry, physics, anatomy, physiology, biochemistry, pathology, medicine, surgery, and midwifery, at salaries from £150 to £750 a year

Chief assistantships.—Two or three chief assistants are appointed in each professorial unit at from £300 to £400 per annum, four medical and four surgical chief assistants are appointed yearly in the non-professorial units at £200 per annum; and each special department has a chief assistant

The *St. Bartholomew's Hospital Journal*, edited by students, is published monthly and obtainable from the college office.

Charing Cross Hospital

In 1815, when medical schools were mostly the private property of teachers, Dr. Benjamin Golding conceived the idea of providing students with wider education and experience by the foundation of an institution of university standard where scientific and practical instruction could be combined. His scheme also aimed at making good the deficiency in



provision for the sick poor of West London. Dr Golding began by opening his own house in St Martin's-lane to out-patients, but the accommodation there was soon outrun, and in 1823 an infirmary and dispensary was started in Villiers-street. Within 15 beds and a small number of students. Within eight years support for this institution had been so

great that a new site was acquired and the foundation stone laid of the present hospital The hospital was formally opened in 1834, with its new departure of a medical school in the same building

Students pursue their primary and intermediate studies at King's College, University of London From its inception the school has aimed at maintaining close personal contact between the staff and students, and to make this possible the number of students admitted is limited to 30 a year In this way overcrowding of classes is avoided, and during his appointment as clerk and dresser each student is responsible for at least six beds

There is no residential hostel attached to the school, but for those who do not live at home lodgings are easily obtainable There is a students' club at the school with a common room, facilities for badminton and squash, and a refectory The sports ground is at Colindale, half an hour by tube from the hospital, where there are pitches for rugby and association football, hockey and cricket, and hard tennis courts A pavilion has recently been erected, equipped with every modern convenience, including thermostatically controlled showers and an oak over-floor for dancing in the tea room

Fees—Entrance fee, £10 10*s* Preclinical course, see King's College Clinical course Annual fee, £30 18*s*, Students' Union subscription, £4 4*s* per annum, fevers, £3 3*s*, vaccinations, £1 11*s* 6*d*

Entrance scholarships—(1) Three scholarships of £65 awarded annually to students who have passed matriculation, on the nomination of the dean (2) Epsom College scholarship of £100, awarded periodically on the nomination of the headmaster (3) Cranleigh scholarship of £100, as above (4) Two university scholarships of £120, in anatomy and physiology and pathology (5) One university scholarship of £75, in anatomy and physiology (6) University exhibitions of £60, awarded periodically at the discretion of the dean

The hospital and school are in the centre of London, and access to them by tube, train, bus, or tram is unrivalled The hospital has 300 beds and is almost the only one of the teaching hospitals able to furnish its students with the number of cases required by the regulations for the examinations in midwifery During his course every student holds a clerkship in the pathological laboratories, where the exceptional facilities of the Institute of Pathology are available to him Special features of the instruction are the time devoted by the staff to teaching in the out-patient department, and the tutorial classes and weekly examination papers for students in their final year

Resident appointments.—There are 27 of these appointments to be filled each year, and as only 30 students are admitted annually there are very few unsuccessful applicants a consideration of great value in the training of the student The appointments are house physicians (3), house surgeons (3), obstetric and gynæcological house surgeon (1), house officers in special departments (4), casualty officer (1), assistant casualty officer (1), resident anæsthetist (1) These are for six months or one year, with salaries of £50–£200, with free board and lodging A resident medical officer is appointed annually at £350 a year with other fees.

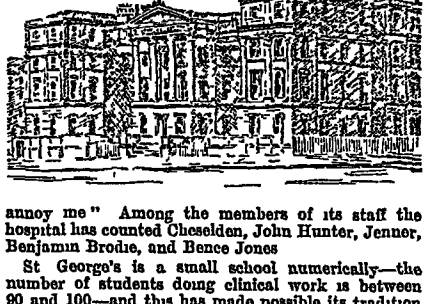
Non resident appointments—Clinical assistants in various departments for one year or longer, unpaid

Registrars—Eight are appointed annually in the medical, surgical, obstetric, ear, nose and throat, fracture and orthopædic and cancer and radium departments at salaries of £100–£150 a year

The *Charing Cross Hospital Gazette* is published quarterly by a students' committee, and obtainable from the editor at the medical school

St. George's Hospital

In 1733 some of the supporters of the Westminster Infirmary in Petty France decided to found a hospital in Knightsbridge, which was famous for its "good air for cure of consumptions, melancholy, and other infirmities," a reputation which is perpetuated in the name Constitution Hill They started their new hospital at Lanesborough House in the fields overlooking Hyde Park, and in this mansion it remained until the present hospital was built a hundred years later From its inception the physicians and surgeons were allowed to have a limited number of pupils, and from 1831 onwards lectures were delivered regularly in the hospital itself It was a difference of opinion with his colleagues as to the admission of certain students which led to John Hunter's death in 1793, and the fulfilment of his reported prophecy, "my life is at the mercy of any fool who choses to



annoy me" Among the members of its staff the hospital has counted Cheselden, John Hunter, Jenner, Benjamin Brodie, and Bence Jones

St George's is a small school numerically—the number of students doing clinical work is between 90 and 100—and this has made possible its tradition of personal instruction and friendly discussion between staff and students dating from the apprentice days There is no residential hostel but lodgings are easily obtained near Victoria for 35*s* a week The hospital club provides luncheon, smoking- and reading-rooms, and a miniature rifle range, and at Wimbledon there is an athletic ground with cricket and football grounds and six tennis courts

The preclinical subjects are not taught at the hospital, and those who enter in the first or second year of the curriculum take the necessary courses at King's College A large proportion of the students entering each year have already done their preclinical work at Oxford, Cambridge, or other universities

Fees—(*a*) At King's College: Registration fee, £1 1*s*; first year, £40 per annum, second year, £41 per annum (*b*) At St George's Clinical period, £42 per annum, club subscription, £3 13*s* 6*d* per annum Pharmacy, £3 3*s*, fever course, £3 3*s*, vaccination course, £1 11*s* 6*d*

Entrance scholarships—(1) Preclinical One scholarship, value £100, in English essay and any four of English, German, Latin, Greek, French, pure and applied mathematics, chemistry, physics, botany, biology (2) Clinical Eight scholarships, value from £50 to £120, and four exhibitions, value £40 Preference is given in one scholarship to candidates from Pembroke College, Cambridge

Other scholarships and prizes—These include a scholarship in surgery, value £85, prizes in medicine, surgery, and bacteriology, each valued about £33, and a research fellowship value £114

The hospital has 344 beds and there are a further 100 beds at the convalescent branch at Wimbledon which does much to relieve pressure on the hospital accommodation. The hospital and medical school are shortly to be rebuilt and enlarged, the hospital to contain 500 beds, the school to accommodate 150 students, but in the latter increase in facilities rather than increase in numbers is the aim In the new hospital the special departments which are cramped at present will chiefly benefit, in particular the in-patient' midwifery department, which will, it is hoped, provide the statutory number of cases per student without the necessity of going elsewhere. Psychiatric and modern children's and dietetic departments are to be added. It is emphasised that the proportion of students to beds will be kept as before

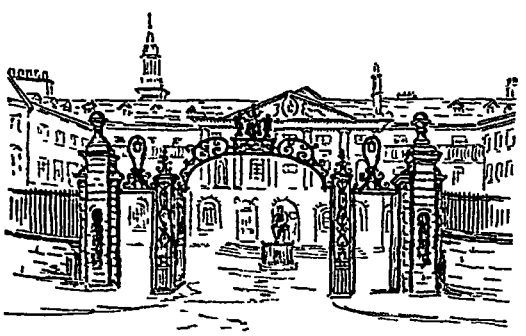
Resident appointments.—There are 4 casualty officers, 4 house surgeons, and 4 house physicians appointed for six months, and usually holding these appointments in succession. Two house surgeons in the ophthalmic and ear, nose, and throat departments are also appointed every six months These 14 officers receive free board and lodging and salaries of £40 a year In addition there is a resident obstetric assistant and a resident anæsthetist, both appointed for six months at salaries of £100 a year

Senior appointments—Resident assistant physician at £250, 2 surgical chief assistants at £200, an R M O. at the convalescent branch at £300, M.O in the biochemical department at £150, orthopædic registrar at £150, registrar to the children's department at £100, and obstetric registrar at £90 There are also registrars and clinical assistants in the various special departments

The *St. George's Hospital Gazette* is published four times a year and is obtainable from the editor at the hospital

Guy's Hospital

The first patients were admitted to Guy's on Jan. 6, 1725, ten days after the death of its founder Thomas Guy was a bookseller in Cornhill who, starting in a small way, acquired wealth first by obtaining from the University of Oxford a privilege to print Bibles and subsequently by shrewd investment in South Sea Stock. Guy's original building is now occupied mainly by the surgical wards. The hospital has since been steadily added to by numerous benefactors and now contains 691 beds and deals with nearly 100,000 out-patients annually. The medical school may be said to date from the resolution of



the governors in 1769 that the surgeons of the hospital should occasionally give lectures to the pupils entered at the hospital, and until 1825 there was free interchange of teaching between Guy's and St. Thomas's. In 1825 this union was dissolved and Guy's built an anatomical theatre, a museum, and a dissecting-room of its own.

At the present time there are 504 medical and 351 dental students, most of whom live either at home or in lodgings, especially in the neighbourhood of Forest Hill, and there is accommodation for 28 students at the college in Great Maze Pond opposite the east gate of the hospital. The college, which is run by a committee, also houses the resident house officers and the students' club. The latter includes a reading-room and library, two dining-rooms, and a gymnasium, and is open to all members of the clubs' union In addition there are two squash rackets courts in the hospital grounds and a swimming bath which students may use three days a week The hospital athletic ground is at Honor Oak Park and can be reached in about a quarter of an hour from London Bridge station Here there is a field for football, hockey, cricket, and athletics, with a covered stand to seat 600 people and a pavilion with dressing-rooms, tea-rooms, and so on, and there are also 13 grass and 3 hard tennis-courts The various clubs and societies of the medical school have been amalgamated into the clubs' union, and an annual subscription of five guineas covers membership of them all.

Fees—First year, £35; second and subsequent years, £49 per annum; instruction in fevers, £3 3*s*, clubs' union subscription, £5 5*s* per annum. Students entering for only the clinical period pay an entrance fee of £14 and an annual fee of £49.

Open junior scholarships—Entrance scholarship in arts, value £100, entrance scholarship in science, value £100; war memorial scholarship of £200, awarded every other year, alternately in arts and science

Junior science scholarship of £100 for students who have attended preliminary science classes at Guy's

Epsom scholarship, awarded annually to a boy from Epsom College, entitling the holder to free education for the 5½ years' course

University entrance scholarship of £100 and exhibition of £60, awarded annually on an examination held in common by St Bartholomew's, St. Thomas's, and Guy's Open to students who have completed their examinations in anatomy and physiology at a British university outside London

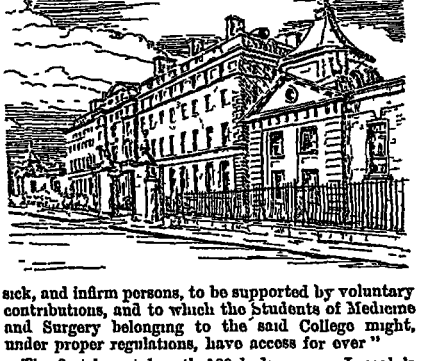
Resident appointments.—The following are usually held more or less in succession: assistant house physician (6), assistant house surgeon (4), out-patient officer (4), house surgeon (4), or house physician (4) The first three of these are for three months and the others for six. In addition there are the following more specialised appointments, each for six months: obstetric resident (3), house surgeon in the ear, nose, and throat department (2), the eye department (1), the genito-urinary and orthopædic departments (2), house physician to the children's (1) and the dermatological departments (1), and resident anæsthetists (2)

The *Guy's Hospital Gazette* is published fortnightly. There is a students' number in September, obtainable from the Gazette Office, Guy's Hospital, S E 1.

King's College Hospital

The hospital is one of the two in London which were founded primarily as teaching institutions in connexion with medical schools which were already in existence King's College itself was founded in 1829 and its medical faculty came into being a year later. At first the students obtained their practical instruction in the wards of existing hospitals in the neighbourhood, but as their number increased this arrangement became more and more unsatisfactory until ultimately, in the words of the college minute book, "the Council of King's College, finding that hospital practice in connection with, and in the

vicinity of, the said College was indispensable for the complete education of its medical students, did, in the year 1839, take measures for the formation, in the parish of St Clement's Danes, in the County of Middlesex, of a Public Hospital for the relief of poor,



sick, and infirm persons, to be supported by voluntary contributions, and to which the students of Medicine and Surgery belonging to the said College might, under proper regulations, have access for over "

The first hospital, with 120 beds, was in Lincoln's Inn fields, in the midst of what was then a densely thronged poor population, and its staff dealt, among other things, with the cholera epidemic of 1849 This hospital was succeeded by a far larger building on the same site in 1861, and here it was that Lord Lister developed his principles of antiseptic surgery In the next forty years the character of the neighbourhood changed, and it was decided to move the institution to a district which needed its services more Thus in 1909 the foundation stone was laid of the present building at Denmark Hill, which is near to Camberwell in South London

The medical school, which since 1909 has been managed entirely separately from King's College, now has 323 students Twelve women students are admitted each year to the final medical studies

Instruction in the preclinical subjects is given at King's College in the Strand, but the whole of the final medical course, with the exception of classes in infectious fevers, is provided at the school

The new school buildings opened by the Duke of Kent in 1931, include a refectory, common rooms, lecture rooms and research laboratories There is a hostel for men students within five minutes' walk of the hospital This is a large house with a good garden standing on high ground, and accommodates 75 students in bed sitting rooms at from £66 to £80 a year There are grass and hard tennis courts in the grounds of the hostel, and squash courts and tennis-courts at the medical school The hospital athletic ground on Dog Kennel Hill is within half a mile of the hospital, and here there are rugby, cricket, tennis, and hockey grounds

Fees—First year, £10, second and third years, £44 per annum final years £50 per annum or £130 for the 3 years' course (club subscriptions and special courses included)

Entrance scholarships—(1) *For the whole course* (*a*) three Warneford scholarships in arts value £120 (*b*) Sambrooke scholarship in arts or science value £90; (*c*) science scholarship, value £100 (2) *For clinical studies only* (*a*) two Raymond Gooch scholarships awarded on a report from the authorities of the candidate's college, value £105 each (*b*) two Burney Yeo scholarships awarded to candidates from Oxford or Cambridge on the recommendation of their respective Regius professors, value £105 each, (*c*) Epsom College scholarship, value £100, (*d*) anatomy and physiology scholarship, value £100, (*e*) pathology scholarship, value £100, (*f*) two Seaman scholarships for sons of Church of England clergymen, value £125 each

Resident appointments—Casualty officers (2), anæsthetists (2), radiologist (1), clinical pathologist (1), house physicians (4), house surgeons (10), total 20 These all receive free board and lodging and salaries

Non resident—Assistant casualty officers (6), clinical assistants (12) These posts are unpaid

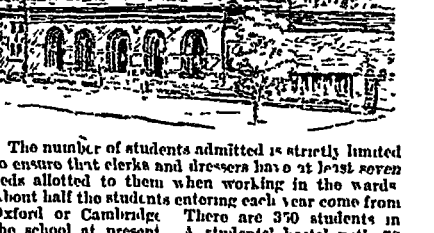
Registrars—Nine registrars at salaries of £250 per annum

The hospital now has 384 beds, but it was designed on a large scale and its ultimate accommodation will be 600 The ten boroughs south of the Thames are provided with only three large general hospitals, and of these King's, the farthest south, serves an immense number of people, hence the available clinical material is ample

The *King's College Hospital Gazette* is published quarterly and may be had from the editor at the hospital

The London Hospital

In 1740 seven men met at the Feathers Tavern in Cheapside and decided to found a hospital on a capital of 100 guineas They rented a house in Featherstone-street, near the Dog Bar, at £16 per annum, and thus became the first home of the "London Infirmary" Next year they moved to larger premises, engaged a nurse, and even admitted a surgical pupil The present site in Whitechapel road was leased in 1752, and the main building was completed by 1759 Additions were made as funds became available, and from its small beginnings the "London" grew into the largest voluntary hospital in England John Harrison, the first surgeon to the hospital, had lectured to students from very early days, but it was the enthusiasm and generosity of Sir William Blizard which led the governors in 1785 to set an example by erecting a complete medical school on the model of the medical faculty of a university In 1785 the Medical College was incorporated as a constituent school of the University of London



The number of students admitted is strictly limited to ensure that clerks and dressers have at least *seven* beds allotted to them when working in the wards About half the students entering each year come from Oxford or Cambridge There are 350 students in the school at present A students' hostel with 78 bed sitting rooms was opened by Queen Mary four years ago, and here board and rooms can be had for from 35s a week Other students have no difficulty

in finding satisfactory lodgings in the eastern area extending to Leytonstone and Chingford close to Epping Forest The hostel and college have squash, fives, and tennis-courts, and there is a 13-acre ground at Highams Park with provision for cricket, rugby and association football, hockey, and tennis Recently three tennis-courts, two practising wickets and a rugby scrum ground have been provided near the students' hostel. The hospital can be reached in 20 minutes by underground railway from Baker-street or Charing Cross

Students are admitted for the whole medical curriculum but those who have not passed their first M.B., although they become full students of the school, do most of their early work at Queen Mary College, which is close to the hospital.

The *fees* are as follows . entrance fee, £10 10*s* ; annual general fee, £48, clubs' union subscription, £5 per annum

Entrance scholarships—(1) Two "Price" scholarships of £100, in (*a*) the first M B subjects, and (*b*) anatomy and physiology, awarded in July (2) Two open scholarships of £100, awarded in April in two or more of the following : human morphology and embryology, physiology and pharmacology, biochemistry, pathology, bacteriology, and morbid anatomy (3) Epsom scholarship, open to students from Epsom College, providing a free medical education at the hospital

The hospital now has 891 beds and treats about 15,000 in-patients and performs about 8000 major operations a year. The out-patient department deals with 1400 out-patients every day ! This great size provides exceptional opportunities for students to acquire experience in clinical work, morbid anatomy, and the practical side of medicine in general. A special feature of The London is a medical clinical unit devoted entirely to teaching and research. In addition to the usual special departments there are departments of neuro-surgery, the surgery of the chest, cardiology, and cancer research, and a department of physical medicine All students, after serving a period in the wards, devote three months to a course in therapeutics which includes dispensing, applied pharmacology, medical and surgical nursing and the methods of physical treatment. Arrangements made with local maternity hospitals provide increased opportunities for students to learn the practice of obstetrics.

Appointments after qualification—The size of the hospital necessitates a large number of resident and non-resident house appointments and the chances of a student gaining at least one of these are considerable. There is no limit to the number of appointments which one man may hold, and a good student may be in succession clinical assistant in out-patients, house physician, receiving-room officer, house surgeon, house officer in a special department, and junior and then senior resident accoucheur. A student who holds all these appointments is a strong candidate for a first assistantship, and it is from the first assistants that the honorary staff is largely recruited.

Non-resident appointments—Clinical assistants to the surgical, medical, and special departments (32) The appointments are for three to six months and salaries range from £25 to £100 a year.

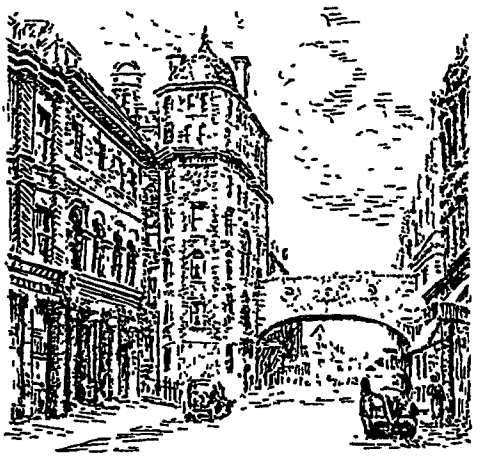
Resident appointments—Accoucheurs (2), receiving-room officers (7), house physicians (9), house surgeons (11), emergency officers (2) Appointments are for six months with free board and lodging.

First assistants (registrars) to the medical, surgical, obstetric, children's, and aural departments, appointed for three years at £250–£300 a year. A resident anæsthetist at £200, supervisor of minor operations at £200, assistants in the departments of pathology and bacteriology at £150 a year.

The *London Hospital Gazette* appears monthly in term time and may be had from the editors at the hospital.

St. Mary's Hospital

The origin of St. Mary's Hospital was due in large measure to James Lane, the anatomist The Prince Consort was interested in the project and in 1851 the hospital was thrown open ; the following year the first lecture was given in the medical school When a school is free to choose its teachers independent of the claims of its own students it usually follows that an exceptional staff is gathered together and for many years the staff at St. Mary's was out



standing. Cheadle, Edmund Owen, Sir William Broadbent, Sir Anderson Critchett, and Sir Malcolm Morris were members of a very fine teaching staff at the end of the last century But it is to the years since the war that St Mary's men will look back as a period in which the school has taken a leading part in educational policy : for example, in making use of the municipal hospitals (then known as poor-law infirmaries) ten years before such a practice became general, in the active support of the attempts to provide an academic career in medicine through professorial units ; in the provision of post-graduate courses for their old students (a movement that has now become general) ; and lately in taking a lead in raising the entrance standards.

The situation of the hospital and medical school is unique, for while it is adjacent to a large poor district with a population of 500,000, it is also within a few minutes' walk of Kensington Gardens and an extensive residential district, in which students can live in excellent rooms at a very reasonable cost and avoid a daily wearisome journey to and from their work A registry of approved rooms is published monthly for the use of students.

Soon after the war the authorities at St Mary's were struck by the contrast between the life of the average medical student before coming to London and after joining his medical school. With the exception of the first teams of the various clubs the vast majority of the students played no games at all Accustomed to some sort of exercise daily at their school or college they embarked upon a period of 3–6 years in which their exercise was often confined to the journey from their rooms to the hospital A prolonged attempt has therefore been made to get not only the man who is good at games but the great body of the students to take regular exercise The results have been remarkable. Almost a third of the students now belong to one club alone, and the number and quality of the junior teams is quite unusual For many years the condition of the sports ground

in winter—situated as the other schools' grounds were, on clay—detracted from the value of the winter games for some months The acquisition of the Old Merchant Taylors ground at Teddington (13 acres), which is on sand and remains dry throughout the winter, has completely transformed this state of affairs, and has been an immense asset in the provision of games for the junior teams

Approximately £250,000 have been spent in rebuilding the medical school and laboratories Apart from the laboratories, class rooms, and theatres for all subjects in the curriculum, they include a library, restaurant, students' club, billiards room, full sized swimming bath, squash rackets court, gymnasium, boxing ring, and an underground garage for 50 cars The school was formally opened by King George V in 1933 The number of beds in the hospital is now 476

In future only students who have passed, or obtained exemption from, the matriculation examination of a university can be admitted The number of full course students in the past year was 413

Entrance scholarships—All entrance scholarships are awarded annually in June by nomination The Geraldine Harmsworth scholarship (£200) and other university scholarships are open to members of Oxford and Cambridge Universities who have completed their examination in anatomy and physiology Scholarships open to the public schools to the value of £430 are also awarded annually

Fees—The composition fee for the entire curriculum is £205 and for the clinical portion 95 guineas The fee for the amalgamated clubs is 4 guineas a year

Resident appointments—Six house physicians (8 months), ten house surgeons (6–8 months), and four resident obstetric officers (6 months) are appointed annually Two resident anæsthetists (6 months) at £150 per annum, four casualty house surgeons (6 months) at £100 per annum, with board and residence

Non-resident appointments—Two medical registrars, a surgical registrar at £200 per annum with partial board, an obstetric registrar at £100 per annum, and a radium registrar at £50 per annum are appointed annually In addition five assistants to the medical and surgical units are appointed from time to time, with salaries ranging from £400 to £700 per annum

St Mary's Hospital Gazette is published ten times a year and may be obtained from the editor at the hospital

Middlesex Hospital

The hospital was founded in 1745 in Windmill-street under the presidency of the Duke of Portland In 1745 a majority decision to expand the hospital from its original 20 beds, to maintain it for general patients instead of limiting it to maternity cases as had been proposed, and to move to its present site, led to the resignation of the president and a number of governors Under the new president, the Earl of Northumberland, whose descendants have held that office ever since, the hospital grew steadily In 1702 Mr S Whitbread endowed a ward for cancer patients the first of its kind Similar endowments during the next hundred years culminating in that of the Barnato Joel trustees in 1909, established the hospital as the leading cancer institution in the country In 1925 the foundations showed signs of imminent collapse and it became necessary to rebuild the entire Middlesex In view of the increasing calls on the hospital's services it was decided that this should be done as thoroughly as the site would allow, and with the help of generous individual gifts it has been possible to erect a series of buildings which may be called a model of their kind

The medical school was founded in 1835, but teaching in the wards began in the earliest days of the hospital's existence, nearly 100 years before Moreover, the famous Great Windmill street School of Anatomy, founded by William Hunter, was taken over by Sir Charles Bell in 1812, and became virtually a school of the Middlesex Hospital of which Bell was, from 1814, one of the surgeons The school covers the entire curriculum and now has 387 general students It is now being rebuilt and the first of the three sections will be ready for occupation in September There is a residential college attached to the school with bed sitting rooms for 60 students and for the hospital resident staff, a common room, gymnasium, and squash rackets court The amalgamated clubs, of which each student becomes a member, have lately been given a new athletic ground at Chalehurst with ample space for cricket, rugby and association football, hockey, and tennis

Fees—Entrance fee, £15 15*s*, annual inclusive fee, £50 Clubs subscription, £5 5*s* per annum

Scholarships—Two entrance scholarships, one in arts and one in science, of £100 each Freer Lucas scholarship (Epsom), value £234 Edmund Davis exhibition (King's School, Canterbury), value £234 Two scholarships of £100 each for Oxford or Cambridge students Two scholarships of £100 each open to students of the medical school about to begin clinical work Two Broderip scholarships, value £60 and £40 The Lyell scholarship and medal, value £55 The Freeman scholarship, value £30 Other prizes are also awarded annually

There is now room in the hospital for 700 beds including 90 for cancer patients, although at present funds only allow the occupation of 614 beds There

are 60 beds for paying patients intended primarily for those of moderate means These patients have of course the benefit of all the hospital services The figures for 1938 show 315,000 out patient attendances, 9000 in patients, and an expenditure of £191,000 The recently opened Meyerstein Institute of Radiotherapy for the treatment of cancer by radium and X rays, complete with a four gramme radium unit, adjoins the cancer wards Both the compactness of the wing and the perfection of the equipment make it unique in this country

Resident appointments—House physicians (10) house surgeons (16), and gynæcological house surgeons (2) One senior and two junior resident anæsthetists are elected annually from among the students of the hospital who have qualified They are also eligible for the posts of

medical and surgical casualty officers and resident officers to the special departments The posts are held for six months The house physicians and house surgeons live and board in the residential college free of charge

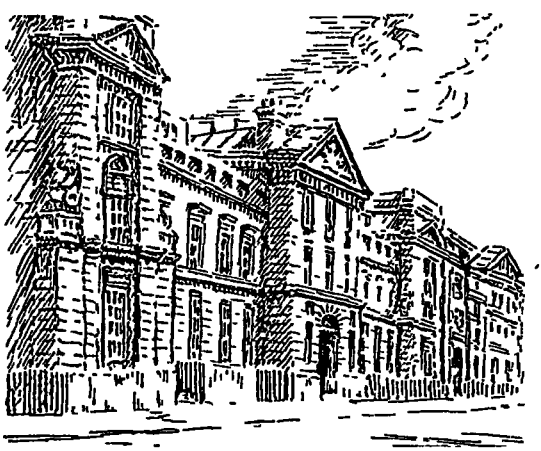
Non-resident appointments—Clinical assistants are appointed in the out-patient departments In addition registrars are appointed annually in the medical (4), surgical (4), obstetric (1), otological (1), fracture (1), and dental (1) departments They are eligible for reappointment up to three years

Middlesex Hospital Journal is published six times a year and may be obtained from the editor at the medical school

Royal Free Hospital

LONDON SCHOOL OF MEDICINE FOR WOMEN

The school was founded in 1874 by Dr. Sophia Jex-Blake A small house was taken in Henrietta-street (now Handel-street), Brunswick-square, and with the support of Dr Elizabeth Garrett (Anderson), Mrs Thorne, and other friends, teaching classes were opened there with 14 students. At first no hospital would provide clinical instruction for women and no qualifying body would admit them to examinations It was not until 1877 that an agreement was made by which the Royal Free Hospital was united with the school to provide the necessary hospital practice, and in the same year the University of London opened all its medical degrees and honours to women By this time there were 34 students who had completed the three years' curriculum at the school and were ready to begin clinical work. Since then the school has steadily gone forward. In 1874



there were only two women on the Medical Register—Dr Elizabeth Blackwell and Dr Elizabeth Garrett Anderson—to-day there are over 6000, of whom about 1800 were educated at the school, and there are 375 students undergoing training

The medical school covers the whole curriculum but a limited number of students are admitted for the clinical years only The various social, athletic, and other clubs at the school have been amalgamated into the students' union, and an annual payment of £3 3*s* covers the subscriptions of them all Common rooms, dressing-rooms, and so on are provided at the school and at the hospital, and meals can be obtained at moderate prices at the school refectory and hospital dining-room There are sets of residential chambers which accommodate 52 students in Tavistock-square, Gordon-square, and Brunswick-square, and other students live in the University of London hostel, College Hall, in Malet-street

Fees.—Annual inclusive fee, £50. Students entering only for the clinical course pay an entrance fee of £25.

Entrance scholarships—The following are awarded on an examination in arts or science: (*a*) two scholarships of £30 a year for six years, (*b*) exhibition of £60 a year for three or five years; (*c*) scholarship of £50 a year for three or five years, (*d*) scholarships of £90 a year for five years and of £20 a year for four years are awarded on the results of entrance examinations. The following are awarded to students who have passed or are taking the course for the London First M B examination (*e*) bursary of £50 a year for three years, (*f*) two scholarships of £75 a year for four years, (*g*) scholarship of £37 a year for four years; (*h*) scholarship of £25 a year for four years Two scholarships are open to those who intend to become missionaries There are many scholarships open to students during their clinical years and to post-graduates.

The Royal Free Hospital has 327 beds, and there is a large midwifery district worked from the Duchess of York Maternity Clinic and from the Elizabeth Garrett Anderson Hospital. Clinical instruction is also given at the South London Hospital for Women, the Cancer Hospital and elsewhere, and students may hold clerkships at the National Hospital for Nervous Diseases, the Central London and Royal London Ophthalmic Hospitals, and at the Children's Hospital, Great Ormond-street.

Resident appointments—House physician (3), house surgeon (4), anæsthetist (2), pathologist (1), obstetric house surgeon (3), held for six months with free board and lodging

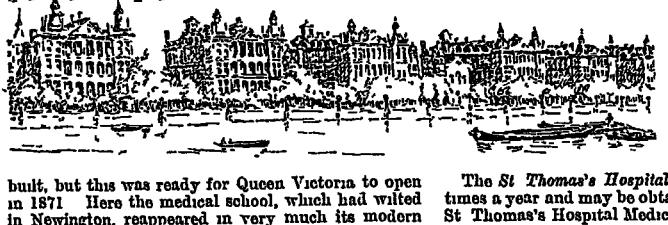
The *London (R F H) School of Medicine for Women Magazine* is issued three times a year

St. Thomas's Hospital

Many years before Becket was born the hospital which was to be given his name had its origin in the infirmary of the religious house which stood on the present site of Southwark Cathedral. Certainly by 1106 the monks were there caring for sick people besides those within their own walls Thomas Becket added a new infirmary to the old priory and this was named St Thomas's Spital after him In 1213, after a disastrous fire, King John published an appeal for funds beginning. "Behold at Southwark an ancient spital, built of old to entertain the poor, has been entirely reduced to cinders and ashes" On the proceeds of this appeal the whole priory was rebuilt at the opposite side of the Borough High street where it remained until 1862 The hospital was closed in 1540 by Henry VIII but was reorganised, endowed, and reopened by Edward VI in 1553 The old monastic hospital lasted until the end of the seventeenth century, when the grand committee suggested rebuilding it, and it was as part of this rebuilding scheme that Thomas Guy came to erect what was primarily intended as an overflow hospital for incurables and lunatics on the other side of St. Thomas's-street

During the seventeenth century, and probably some time before, the surgeons of the hospital took apprentices and had "skillet carriers," the forerunners of dressers, and by 1750 dressers were fully recognised. Lectures on anatomy and surgery were given by Cheselden as early as 1711. In 1725, when Guy's began to take pupils, the two Southwark schools combined their teaching and were known as "The United Hospitals" and this association lasted until differences of opinion on the appointment of the staff ended it in 1825. In 1859 the South Eastern Railway Company announced its intention of extending its line through the gardens of the hospital as

Parliament overruled the governors' opposition but made the company buy the whole hospital site for nearly £300,000 For nine years the hospital lived in a disused menagerie in Newington while the new hospital on the Albert Embankment was being



built, but this was ready for Queen Victoria to open in 1871 Here the medical school, which had wilted in Newington, reappeared in very much its modern form Various additions have since been made and the hospital now has 644 beds

Owing to the munificence of the late Mr Michael Herbert the medical school was largely reconstructed in 1932 There are now 360 students, 60 of whom are housed in the residential hostel immediately opposite the hospital Here at St Thomas's House is a fully equipped club with dining, smoking, and billiards rooms, and close by there are squash courts, a hard tennis-court, a gymnasium, and swimming bath The amalgamated clubs' ground is at Chiswick, where there are ample facilities for football, cricket, and tennis In addition there are opportunities elsewhere for boxing, rowing (at Putney), fencing, swimming, golf, rifle shooting, and sailing

The majority of students begin their work in October, but those who have done their preclinical work may equally well join in January, April, or July Those entering for the full course must have passed the London matriculation or its equivalent, and those who enter for clinical work only must have passed in anatomy and physiology

A close liaison exists between St Thomas's Hospital medical school and Lambeth Hospital, where students are allowed to attend the ward rounds and clinical work of the hospital In addition, two students at a time throughout the year spend a fortnight in residence at St James' Hospital, Balham, where they follow, and take part in, the maternity work of the hospital

Fees—Entrance fee, £5 5s , annual fee £50 , amalgamated clubs' subscription, £5 5s per annum Extra expenses dissection, £3 3s , fevers, £3 3s

Open scholarships in natural science—Two scholarships in physics, chemistry, and biology, value £150 and £60

University scholarship and Hector Mackenzie exhibition—These are awarded on an examination held in combination with Guy's and St Bartholomew's They are open to students who have completed their examinations in anatomy and physiology outside London Value £150 and £60

Foord Calger exhibition—Awarded on an examination either in the first M B subjects, in anatomy, physiology, or pathology Value £40 per annum for a maximum of five years Preference is given to candidates from Westminster School

Other scholarship—Two scholarships are awarded to enable students to work for the London B Sc examination for a year after passing the Second M B , Part 2 The Anderson scholarship value £35 may be used for the same purpose or for travel Scholarships are also awarded on the results of the sessional examinations for second and third year students and there are a number of scholarships for senior and qualified men Two special prizes are awarded to encourage work in psychological medicine

Non resident appointments—A number of clinical assistants are appointed to the special departments every three months

Resident appointments—There are 26 six month resident appointments, with free board and lodging

Senior appointments—There are a number of these which become vacant from time to time are held for from six months to four years, and carry salaries ranging from £150 to £600 per annum

The *St Thomas's Hospital Gazette* is published six times a year and may be obtained from The Librarian, St Thomas's Hospital Medical School, S E 1

University College Hospital

In 1825 a letter from the poet Thomas Campbell appeared in the *Times* advocating a university of London to provide advanced education without the religious tests and distinctions which then surrounded the older universities The outcome of this letter was the formation of a body of proprietors who were incorporated in due course as the "University of London," and the erection of buildings which were opened in 1828 as University College A faculty of medicine was part of the founders' original scheme, and medical classes were held at the college from its earliest days To provide opportunities for clinical work the University Dispensary was started in 1828 in George street and staffed by the teachers of the college, but this was soon found to be inadequate and five years later a beginning was made with what was at first called the North London Hospital and later University College Hospital, immediately opposite the college buildings

The foundation of King's College in 1829 introduced a complication into the question of a University of London, but after long negotiations a new examining body was incorporated in 1836 to which University College surrendered its title of university, and to which it and King's College were affiliated In 1898, when the university was reconstituted, it was decided to incorporate University College in the university and to continue the preliminary medical studies there, but to carry on the hospital and clinical teaching separately

The school provides for the admission of 80 students a year, 12 of whom are women and men students may have done their preclinical work at University College or at any other recognised school Eight of the women admitted are, however, nominated by University College, the other four vacancies being filled by annual competition There is a hostel for students immediately next to the school, and others live at University College Hall, Ealing, which is within half an hour of the college by train There are two squash rackets courts in the school and at Perivale a 28 acre ground for cricket, tennis, rugby and association football, and hockey

Fees—Preclinical years see University College

For the final examinations of the Universities and Conjoint Board inclusive fee £45 per year for three years

Oxford and Cambridge students who have completed their course in pathology £40 per year for three years

Entrance scholarships—(1) Two Goldsmid scholarships covering the cost of the final course of medical study. (2) One Goldsmid exhibition of £80 (3) Fillıter scholarship of 50 guineas in pathology

Other scholarships—(1) Three Magrath scholarships of about £50 each for proficiency in reporting clinical cases (2) Atchison scholarship of £55 a year for two years,

for general proficiency (3) Atkinson Morley surgical scholarship of £45 a year for three years (4) Fillıter exhibition in pathology, value £30.

Post-graduate scholarships and fellowships.—(1) Radcliffe Crocker travelling scholarship for the study of dermatology, value about £280. (2) Percival Alleyn scholarship for the advancement of surgery by research, value about £300 (3) Leslie Pearce Gould scholarship of about £260. (4) Bilton Pollard fellowship of £650

The present hospital and school of final medical studies were built 30 years ago, and since then the Royal Ear Hospital and the Obstetric Hospital have been added and the National Dental Hospital joined to the school More recently the hospital has benefited through a magnificent grant from the Rockefeller Foundation, which selected it as offering the best opportunity in the British Isles to put medical education on a modern basis.

University College Hospital itself has 414 beds, the Obstetric Hospital 85, the Royal Ear Hospital 41, and the paying patients' wing 77.

Resident appointments—House physicians (8), house surgeons (5), house surgeons to the Royal Ear Hospital (2), and obstetric house surgeons (3), appointed by competitive examination for periods of six months Receive free board and lodging but no salary. Resident medical officer at £200 a year and other fees

Non-resident appointments—Casualty surgical officer and casualty medical officer at £225 a year; house anæsthetist and obstetric hospital anæsthetist at £100 a year; clinical assistants in the V.D. department (5) and infant welfare department (2) at £100; assistants in other departments (6) at £250 a year.

Registrars and assistants in units.—Registrars in the medical, surgical, obstetric, ophthalmic, anæsthetics, and cancer departments, and at the Royal Ear Hospital, at £100–£400 a year. Assistants in the medical, surgical, and obstetric units (12) at £250–£900 a year.

University College Hospital Magazine is issued six times a year and can be obtained from the editor at the medical school

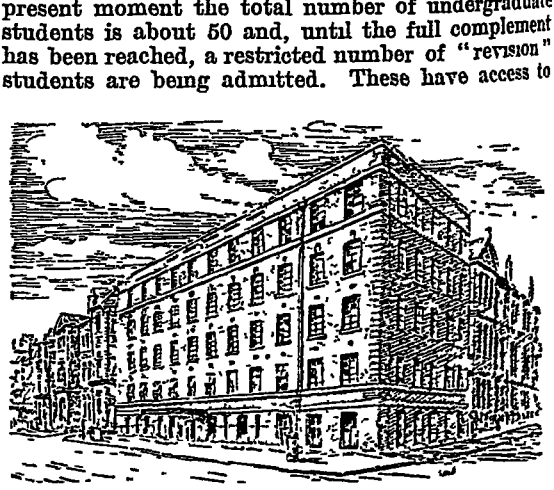
West London Hospital

The medical school is the youngest in London, having started as recently as October, 1937. Hitherto the hospital had been a centre for post-graduate study for some forty years and its Post-Graduate College was the leading institution of its kind in London until the formation, three years ago, of the British Postgraduate Medical School at Hammersmith

The West London Post-Graduate College did not wish to enter into competition with its publicly controlled neighbour and, after consultation with the University of London, it was decided that its facilities could most usefully be employed as a medical school to which the admission of women should be a prime consideration. Steps were accordingly taken to obtain recognition for this purpose from the universities and other examining bodies, and the school has now been recognised as a clinical school for students reading for the medical degrees of the Universities of Oxford, Cambridge, and London, and for the diplomas of the Conjoint Board and the Society of Apothecaries Recognition for students of other universities is sought when required and has never been refused.

As far as the University of London is concerned the school has not yet been admitted to the full status of a "School of the University" but it is hoped that the West London may soon be granted this further recognition. At present the students come under the purview of the Council for External Students but this makes no difference to the course of study; the regulations for internal and external students in medicine are identical.

It is proposed to admit not more than 24 students annually, making a total of approximately 70 for the three years' clinical course All students must have passed their Second M B. examination (anatomy and physiology or its equivalent) before admission The school is open to men as well as women but preference is given to women, and all students, except in very special circumstances, will be required to read for one of the university degrees At the present moment the total number of undergraduate students is about 50 and, until the full complement has been reached, a restricted number of "revision" students are being admitted. These have access to



all the clinics but do not hold any regular appointments and do not, therefore, interfere with the work of the undergraduates.

The school has leased from the hospital two adjacent and intercommunicating houses on the hospital property (1 and 3, Wolverton-gardens) Here are situated the offices, students' cloak-rooms, library, and certain other rooms which form the nucleus of a students' club At present there is no residential hostel but there is ample accommodation in the immediate neighbourhood which is largely residential in character. It is hoped that it will be possible to provide some sort of restaurant

facilities in the medical school buildings quite soon In the meantime the Hammersmith road can supply eating houses to suit all tastes and purses

Until the number of students has increased, the facilities for corporate sport will necessarily be somewhat restricted A students' union has been formed and its committee is actively engaged in negotiations for the provision of outdoor sports An arrangement has already been made for the use by students of the two squash courts at Latymer Court (2 minutes from the hospital)

The *fees* have been fixed at £50 per annum The question of an entrance fee is under consideration As the school has no endowments it is not yet possible to offer any scholarships

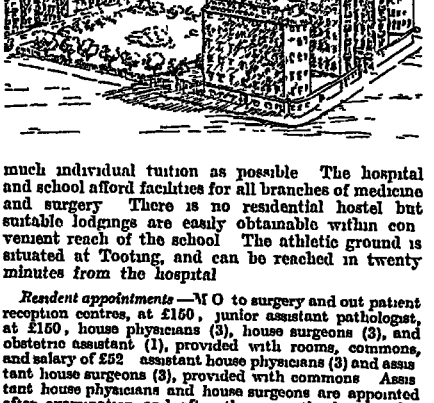
The hospital contains 239 beds and admits some 4000 patients every year The out patient department is exceptionally large and deals with over 43,000 new cases each year while the annual attendances exceed a quarter of a million All the special departments are provided for and the hospital has recently established special clinics for the treatment of injuries and for rheumatic diseases, being the first general hospital in London to do so The midwifery training is done at the West Middlesex (County) Hospital at Isleworth, where there is sufficient material to provide every student with 40–50 personal cases in the two months which is spent there

Resident appointments will be available to students of the school on qualification and a fair proportion of these will be open to women Senior appointments will also be given to old students when suitable applicants are available

Westminster Hospital

The foundation of Westminster Hospital dates back to the beginning of the eighteenth century at which time London had but two general hospitals, St Bartholomew's and St Thomas's In 1715, four gentlemen met at St Dunstan's Coffee House, Fleet-street, to form a "charitable society" One of these, Henry Hoare, was chiefly dominant in providing the funds with which the charity began, and his name is commemorated in perpetuity by a ward, whilst his successors as bankers have had charge of the hospital funds down to the present day In 1720, a house in Petty France was hired and an inscription in gilt letters reading "Infirmary for the Sick and Needy" was placed on the front and a staff of a matron, a maid servant and a messenger was engaged In 1724, a larger house was taken on the east side of Great Chapel street In 1770, five houses in James street were adapted for use as a hospital In 1831, the site in Broad Sanctuary was purchased from the Treasury where the hospital remained until it was lately removed to St John's-gardens, Horseferry road The new hospital, officially opened by the King in May of this year, has 403 beds, including 43 private beds, with all modern requirements Close at hand is the nurses' home and the medical school, thus removing the old difficulties resulting from geographical separation and the annexe devoted to radium therapy and research The number of in patients averages 5000 and of new out patients upwards of 30,000 a year

As early as 1734, apprentices were appointed to the members of the staff but it was not until about 100 years later that the medical school proper began in Dean street, later to be removed to Caxton street where it suffered from increasingly inadequate accommodation The new school, opened in May, 1938, contains a squash rackets court, gymnasium, refectory and common rooms, and above these, the library, museum, class rooms, and laboratories There is also a room specially reserved for the use of old Westminster students Preclinical work is done at King's College, Strand, as before, and the number of clinical students is limited to 120 to ensure as



much individual tuition as possible The hospital and school afford facilities for all branches of medicine and surgery There is no residential hostel but suitable lodgings are easily obtainable within convenient reach of the school The athletic ground is situated at Tooting, and can be reached in twenty minutes from the hospital

Resident appointments.—M O to surgery and out patient reception centres, at £150, junior assistant pathologist, at £150, house physicians (3), house surgeons (3), and obstetric assistant (1), provided with rooms, commons, and salary of £52 assistant house physicians (3) and assistant house surgeons (3), provided with commons Assistant house physicians and house surgeons are appointed after examination and after three months become full house physicians or house surgeons for six months

Non-resident appointments.—Chief assistants and registrars in medical (3), surgical (3), obstetrical (1), orthopædic (1), ear, nose and throat (1), radiological (1), and children's (1) departments at salaries of £100–£250 Two M O 's to surgery and out patient department at £200 House anæsthetist, appointed for six months, at £100 a year Clinical assistants to all departments, unpaid

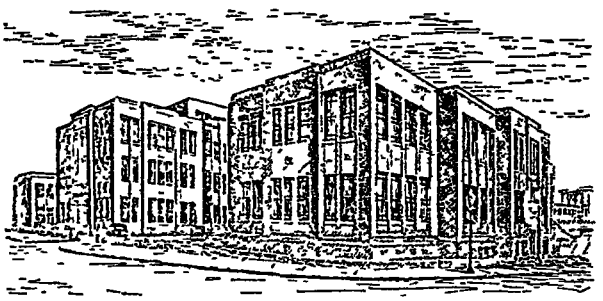
The Broad Way is published four times a year and is obtainable from the business manager at the medical school, 17, Horseferry-road, S W 1

" The customary procedure in filling an academic position is to inquire concerning a prospective candidate from his present and past superiors Since nearly everyone tries to appear at his best in the eyes of his chief, the professors and associate professors often have a false idea of a man's abilities Why not inquire of his inferiors also ? They see him as he is The house staff of a teaching hospital can usually 'size up' the members of the permanent staff as well and sometimes better than the chief can No man should be seriously considered for academic advancement unless he has the respect—not only of his superiors but also of his inferiors The old saying that 'Young men think old men are fools, but old men know young men are fools' is only partly true, but in any case, young men usually know which other young men are fools In a world of crumbling standards the safest assurance for the future of academic medicine lies in the thoughtful selection of the best possible young men Our choosing should be tempered by the sober recollection that each corporal should with justice carry in his knapsack the baton of a marshal "—T R Harrison Presidential address to the American Society for Clinical Investigation *J clin Invest* July, 1939, p 469

UNIVERSITY OF DURHAM

THE MEDICAL SCHOOL, KING'S COLLEGE, NEWCASTLE-UPON-TYNE

The University and its colleges have recently been reconstituted by statutes made by the commissioners appointed under the University of Durham Act, 1935. The University is divided into a Durham and a Newcastle division The former comprises the several colleges at Durham and the latter includes what was formerly called the University of Durham College of Medicine and Armstrong College, which are now merged into King's College, Newcastle-upon-Tyne. The medical school was founded in 1834, when the Barber-Surgeons Hall in Newcastle was



fitted up for the purpose In 1852 a new school was built on a site now occupied by Bolbec Hall in Westgate-road, and became associated with the University of Durham In 1885 new buildings were erected in Northumberland-road, where the medical school remained up to 1938 Now a much more commodious building in Queen Victoria-road has been built and was officially opened by the King in February The new premises, furnished and equipped in the most up-to-date manner, are opposite the Royal Victoria Infirmary and adjacent to the main buildings of King's College

During the past three years the average number of full-time undergraduate students has been about 400, of which about 80 per cent come from homes within 30 miles of the college, 15 per cent from the rest of the British Isles, 3 per cent from other parts of the Empire, and 2 per cent from foreign countries The social interests of students are well catered for in the University Union close to the college, and the athletic ground is within easy reach of the school and provides facilities for cricket, association and rugby football, tennis, and hockey.

Admission —Before entering the medical school the student must pass or gain exemption from (*a*) matriculation, in English, mathematics, French or German, Greek or Latin, and a fifth optional subject, (*b*) the premedical examination, in chemistry, physics and biology The course for (*b*) may be taken either in King's College or at certain other approved institutions Intending students should apply to the dean for the conditions of exemption

Entrance scholarships —The University medical scholarships of £25 a year for 4 years awarded annually, and the Pears scholarship of £40 a year for 3 years awarded every third year are awarded on the results of a special examination held in March each year The Heath entrance scholarship for boys from Kepier Grammar School, and the Province of Durham Masonic entrance scholarship, both value £60, are awarded annually and are renewable Other scholarships worth £5–£45 are awarded annually to undergraduates Post-graduate scholarships of £25–£200 are awarded in medical, surgical, and dental subjects, and grants are available for research

Qualifying examinations —For the degrees of M B, B S, students, in addition to the first (premedical) examination, must pass the second examination in anatomy and physiology, materia medica, pharmacology and pharmacy; the third examination in pathology, bacteriology, public health, and medical jurisprudence; and the final examination in medicine, surgery, midwifery and gynæcology, psychological medicine, ophthalmology, diseases of the skin, of the ear, nose, and throat, and of children At least 3 years must be spent in residence in the University In certain cases candidates may obtain exemption from the first and second examinations The length of the curriculum proper is five years

Fees and cost of living.—The total tuition fees for the complete course under the new regulations will be approximately as follows: for the M B, B.S, £230, for the B D.S, £225; for the L.D.S, £185 These fees include £35 for the first year premedical course In addition there are incidental fees for the students union, library, for board at the maternity hospital, and so on, amounting in all to about £50 (payable at various times throughout the course) Students from a distance have resided in the past in lodgings in Newcastle, but arrangements can now be made for a limited number to live in the college hostels at about £2 a week

Associated hospitals —(*a*) Royal Victoria Infirmary, with over 700 beds and annual out-patient attendances of 375,000. This provides for undergraduate and post-graduate clinical instruction in medicine and surgery and in the work of the special departments (*b*) Princess Mary Maternity Hospital, with 90 beds, for instruction in clinical midwifery. (*c*) Fleming Memorial Hospital for Sick Children (*d*) Newcastle upon-Tyne General Hospital (*e*) City Hospital for Infectious Diseases (*f*) City Mental Hospital (*g*) Newcastle-upon-Tyne Dental Hospital, with over 15,000 operations a year.

Higher degrees —For the degree of *Doctor of Medicine* the candidate must have obtained the M B of the University and have been engaged for at least 2 years subsequently in research or hospital work, the medical services, or in practice A candidate may either present an original essay on an approved subject or pass a special examination in medicine.

For the degree of *Master of Surgery* the general conditions are similar to those for the M D, and the degree is granted after a special examination

For the degree of *Doctor of Surgery* the candidate must have devoted 3 years (not necessarily consecutive), after obtaining a registrable qualification, to the study of surgery One at least of these years must be spent in the University and not less than 6 months in surgical study abroad He must present an essay on an approved surgical subject and pass an examination

The University also confers degrees of *Bachelor* and *Doctor of Hygiene*, and *Doctor of Philosophy*, and diplomas in public health and psychiatry.

Further information about courses and degrees can be obtained from the dean of medicine, the medical school, Newcastle-upon-Tyne

Royal Victoria Infirmary, Newcastle

The infirmary has over 700 beds. Clinical lectures are delivered by the physicians and surgeons weekly and ward demonstrations are given daily. Tutorial classes are given by the assistant physicians, assistant surgeons, the medical and surgical registrars, and the assistant to the gynæcological department, and demonstrations are given in the several out-patient departments daily. Pathological demonstrations are

given by the pathologist daily or as opportunity occurs In addition to medical and surgical in patient and out patient departments the following special departments are fully equipped for teaching ophthalmic, throat, nose, and ear, skin, gynæcological orthopædic, and electrical There are seven operating theatres in use in the hospital

Assistants in the pathological and other special departments and clinical clerks and dressers are appointed periodically Resident appointments are also made every six months, and each year medical and surgical registrars (who also act as tutors) are appointed from candidates who have previously held resident appointments at any recognised hospital These latter posts afford an excellent opportunity for post graduate study Detailed information may be obtained from the dean of the medical school

UNIVERSITY OF BIRMINGHAM

The medical school has been in existence over 100 years, and includes both medical and dental students The total number of students is now about 450, women being accepted as well as men Recently the school has been running at full capacity, and it has been necessary to restrict admissions When selection has to be made, priority is given to those students who are resident in the midland counties and who are taking a university degree The new medical school buildings adjoin the Queen Elizabeth Hospital, Edgbaston, on the Hospitals Centre site

Degrees of Bachelor of Medicine and Surgery—For the degrees at least three years must be spent in attendance upon classes in the University The final year may be spent at any other medical school recognised by the University The normal requirements for entrance for degree courses are (1) a school certificate, and (2) a pass in four subsidiary subjects in the higher school certificate examination taken at one time, or, alternatively, a full higher school certificate in any subject A candidate who obtains a higher certificate in the three principal subjects of chemistry, physics, and biology, may be exempted also from the first year courses and examinations The entrance regulations may be obtained from the secretary, Joint Matriculation Board, 315, Oxford-road, Manchester, 13

There are five examinations for the M B, Ch B degree The Senate may recognise courses of study and examinations at other universities for exemption from the first examination The examinations are as follows *First examination* chemistry, physics, and biology *Second examination* anatomy and physiology *Third examination* general pathology and bacteriology *Fourth examination* (at the end of the fifth year) forensic medicine and toxicology, public health, and materia medica, pharmacology, and therapeutics Two years' hospital work must have been accomplished *Final examination* medicine, surgery midwifery and diseases of women, mental diseases and ophthalmology Attendance at a general hospital for a year after the passing of the fourth examination is required also attendance at a fever, maternity, and mental hospital for three months each Courses of instruction must be taken in vaccination, ophthalmology, venereal and skin diseases, and diseases of ear, nose, and throat, medical and surgical anatomy, and operative surgery Distinctions may be awarded in the subjects (severally) of the second, third, fourth, and final, and first- and second class honours in the final examination

The *fees* for the full course for the M B degree amount to about £250

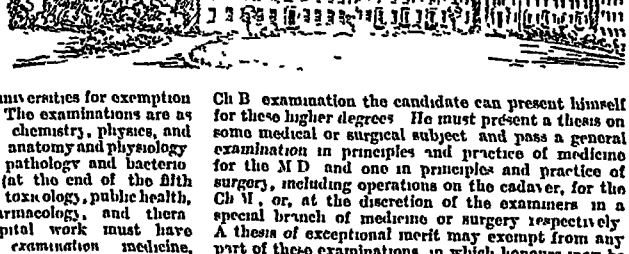
Entrance scholarships (*a*) Frank Fletcher and Catherine Fletcher scholarships of £100 per annum each, for five years Two or more offered annually (*b*) Sydenham scholarship of £42, tenable for three years, for orphan sons of medical practitioners (*c*) Sands Cox scholarship of £21 per annum for two years, awarded to the candidate taking the highest marks at the higher school certificate examination of the Joint Matriculation Board

Other scholarships—(*a*) Walter Myers travelling studentship of £300 awarded to M B candidates, tenable for one year at some university or hospital outside the British Isles (*b*) Fentham trustees and Hills post graduate scholarships, both of £130 per annum, for research in medicine or surgery

Students receive clinical instruction at the Birmingham United Hospital (General Hospital and Queen's Hospital), Maternity Hospital, Children's Hospital, Birmingham and Midland Eye Hospital, and at the Birmingham Mental and Fever Hospitals, under the direction of the Board of Clinical Studies At these hospitals appointments are open to recently qualified students at salaries of £40–£200 a year

Post graduate instruction.—Ingleby Lectureship (endowed) two post graduate lectures on a subject relating to midwifery and diseases of women and children are delivered annually (no fee) William Withering Lectureship (endowed), a course of three or four lectures is given annually on subjects chosen from year to year (no fee) Special post graduate courses are arranged from time to time at the Birmingham United Hospital (General and Queen's) and the Children's Hospital

Degrees of Doctor of Medicine and Master of Surgery One year after having passed the final M B,



Ch B examination the candidate can present himself for these higher degrees He must present a thesis on some medical or surgical subject and pass a general examination in principles and practice of medicine for the M D and one in principles and practice of surgery, including operations on the cadaver, for the Ch M, or, at the discretion of the examiners in a special branch of medicine or surgery respectively A thesis of exceptional merit may exempt from any part of these examinations, in which honours may be awarded

Degree of Ph D—Candidates must possess a medical degree of a British, Colonial, or other university approved by the Senate of the University, and have been engaged as a rule in advanced study for two years, either in a laboratory of the University or in

one or more of the hospitals associated with the University. But under approved conditions after the first year research may be carried on elsewhere, when, on completing the course, candidates present a thesis and submit themselves for oral and possibly written examination.

Birmingham United Hospital

The Birmingham General Hospital, the Queen's Hospital and the Queen Elizabeth Hospital, formerly known as the Hospitals Centre, have now been incorporated as one hospital by Act of Parliament Altogether the United Hospital has 1335 beds.

BIRMINGHAM GENERAL HOSPITAL has 485 beds A children's ward has been built, and there are special wards for gynæcological, ear and throat, venereal, and radium patients, with special beds for eye and skin patients. Laboratories are provided for bacteriology, biochemistry, cancer research, and morbid histology In addition to clinical teaching in the wards and out-patient department by the honorary medical staff, medical and surgical tutorial classes are held for senior and junior students. The radiation department is of special interest, the latest addition being a 3-gramme radium bomb The department also possesses deep X ray, Chaoul, and superficial apparatus Post-graduate classes are held in every branch of medicine and surgery

The *resident appointments* are surgical officer and medical officer, surgical registrars (3), anæsthetist, house physicians (4), and house surgeons (10)

QUEEN'S HOSPITAL has 336 beds Ward rounds and out-patient clinic classes are held daily, and regular tutorial classes throughout the session Post-graduate courses arranged by the University are conducted every year. There are special departments in gynæcology, diseases of the eye, of the ear, nose, and throat, dentistry, dermatology, radiology, pathology, bacteriology, biochemistry, physiotherapy' electrocardiography, and there is a psychiatric clinic associated officially with the Birmingham Mental Hospitals. There are also large wards for midwifery and postnatal cases, a nursery for instruction in infant welfare, an extensive midwifery district, and residential facilities for students. There are 35 *resident appointments* (inclusive of registrars) available each year for recently qualified students.

QUEEN ELIZABETH HOSPITAL at Edgbaston was opened in July of last year. It is close to the new medical faculty buildings of Birmingham University, to which it is linked by a corridor, and there is the closest coöperation between the hospital and the medical school, most members of the staff being common to both institutions. The hospital has 516 beds for medical and surgical, ear, nose, and throat, gynæcological and obstetric, ophthalmic, dental and skin cases, and out-patient consultations are arranged in the ward units There are five general and five specialist operating theatres, a spacious X ray department with a full range of apparatus for treatment and diagnosis, a supply of radium, a massage and electrical department, to which a hydrotherapy department will later be added, and special laboratories for bacteriology and biochemistry.

There are many *resident appointments*, including a resident medical officer, a resident surgical officer, medical and surgical registrars, and house physicians and house surgeons to the general and special departments.

UNIVERSITY OF LIVERPOOL

The teaching of medicine at the University dates back to 1789, but the first school was founded in 1834, and in 1844 this was taken over by the Liverpool Royal Infirmary school of medicine which continued until the establishment of University College, Liverpool, in 1881. The council of this school took a prominent part in the foundation of University College and in 1884, when University College became part of Victoria University, the school became the medical faculty of the college From that date the school developed rapidly so that in 1903, when University College was dissolved and the charter of the University of Liverpool was granted, there were 190 students. At the present time there

are 14 chairs and 657 students. Instruction is provided in well-equipped modern laboratories, most of them constituting a block of buildings which forms one side of the University quadrangle. The medical school for anatomy, surgery, forensic medicine, and toxicology; the Thompson-Yates laboratories for physiology and pathology, and the Johnston laboratories for biochemistry are included in the block, and there are separate buildings for medicine, pharmacology, bacteriology, tropical medicine, and public health.

Clinical instruction is given at (*a*) the Royal Liverpool United Hospital; (*b*) five special hospitals the Eye, Ear, and Throat Infirmary, the Women's Hospital, the Royal Liverpool Children's Hospital, the Liverpool Maternity Hospital, and St. Paul's Eye Hospital; (*c*) certain municipal hospitals: the County Mental Hospital, Ramhill, and the Seamen's Dispensary. All the hospitals are within easy reach of the University. They provide ample clinical material for students and a large number of resident appointments for qualified men

Admission—Students are required before beginning their courses to have passed the examination or examinations for matriculation into the University or an examination or examinations recognised as exempting therefrom Qualification for entry upon a degree course will normally be based upon the performance of the candidate in the school certificate and higher school certificate examinations conducted by the joint matriculation board or by other recognised examining bodies Full information will be found in a pamphlet, "Qualifications for entry upon a degree course," to be obtained from the registrar of Liverpool University or the secretary of the Joint Matriculation Board. Requests for papers set at previous examinations and application for exemption should be addressed to the secretary, Joint Matriculation Board, 315, Oxford-road, Manchester, 13.

Entrance scholarships—Tenable for four years: (*a*) Robert Gee entrance scholarship (men) of £42 10*s*., (*b*) Mary Birrell Davies memorial fund scholarship (women)

of £60 Tenable for three years (c) Bromley scholarship of £45, (d) Christopher Bushell scholarship of £40, (e) Henry Wade Deacon scholarship of £68, (f) Gossage scholarship of £60, (g) Cyril Edward Gourley scholarship of £30, (h) Henry Bloom Noble scholarship of £100, (i) John Patterson scholarship of £100; (j) Gibson Sinclair scholarship of £50, (k) Margaret Bryce Smith scholarships of £100 each, (l) Woolton Mechanics' Institution of £65 Some of these are restricted to candidates from specified areas

Where the value of an entrance scholarship is less than the tuition fees payable, it will, in most cases, be raised to that amount

Residence of students—There is no accommodation for residence within the University precincts, but halls of residence are provided for students who cannot live at home There are two halls for men in Greenbank, Mossley Hill, and one for women in Holly road, Fairfield The fees for board and residence for the three ordinary University terms are for men, £72, for women, £65–£72 All undergraduates not permanently resident in Great Britain are required to reside in approved lodgings, unless exempted by the Vice Chancellor The charges of these vary from 30*s* to 45*s* a week.

Qualifying examinations—Candidates for the degrees of bachelor of medicine and surgery must pursue the courses of study required by the University regulations during not less than six years Of these six years they must spend in the University at least three years altogether, or at least two after they have passed the first examination The other three may be spent at any recognised university or medical school The candidates must pass three examinations the first examination, taken in his first year in chemistry, biology, and physics, the second taken in his third year in anatomy and physiology (including biochemistry and histology), and the final, which is divided into three parts (1) pathology, pharmacology, and general therapeutics, (2) forensic medicine, toxicology, and public health, and (3) medicine, surgery, and obstetrics These parts may be taken separately, but candidates may not present themselves for part 3 until they have completed their sixth year of medical study and passed parts 1 and 2

Fees—The various courses may be taken separately, or certain groups of courses may be taken together at composition fees which are considerably less than the total of the fees for the separate courses The composition fee for students taking the full six years' course is £198 12*s* (payable in yearly instalments varying from £19 to £45), to which must be added the clinical studies fee of £60 (payable in three yearly instalments of £20 each) The examination fees are 20 guineas for the three examinations The approximate cost of the M B course (tuition, examination, guild of undergraduates fees, &c), together with an estimate of the cost of instruments and books is £382 3*s* 6*d*

Higher degrees—The University grants three higher medical degrees Doctor of Medicine (M D), Master of Surgery (Ch M), and Master of Orthopædic Surgery (M Ch Orth)

A candidate for the degree of M D, or Ch.M must have obtained the degree of M B (Liverpool) and at least two years must have elapsed since he passed the examinations for that degree

For the degree of M D the candidate must present a thesis; and, if this is accepted present himself for an oral examination on the subject of the thesis A candidate may also take the degree of M.D five years after taking his M B by passing an examination in medicine, together with a selected branch of medicine

A candidate for the degree of Ch M must furnish certificates of having satisfied the requirements for attendance and study for a period of at least two years subsequent to graduation The subjects of examination for the degree are surgery, clinical surgery, operative surgery, surgical pathology, and bacteriology, and surgical anatomy

The degree of M Ch Orth may be conferred, after examination, upon graduates in medicine of Liverpool or other approved Universities, and upon graduates in a faculty other than medicine of Liverpool or other university who are Fellows of the Royal College of Surgeons of England, Edinburgh, or Ireland, or of the American College of Surgeons

Royal Liverpool United Hospital

In January, 1938, the four voluntary general hospitals attached to the medical school of the University of Liverpool—viz, the Liverpool Royal Infirmary (366 beds), the David Lewis Northern Hospital (220 beds) the Royal Southern Hospital (232 beds), and the Liverpool Stanley Hospital (120 beds)—were amalgamated under the title of the Royal Liverpool United Hospital The aim of the amalgamation is eventually to create one large teaching hospital of a thousand beds, and in the meantime, to establish a closer working between the four hospitals

The *appointments* available for qualified students in the United Hospital are 8 house physicians 18 house surgeons, 4 casualty officers, 7 medical registrars, 7 surgical registrars, 2 gynæcological registrars, 3 orthopædic registrars, and 2 radiological registrars, together with a variable number of posts as clinical assistants Students are appointed as surgical dressers and clinical clerks for a period of three months and also as casualty dressers for one month The following special clinics are open to students asthma, cardiological, diabetic, ear, nose and throat, gynæcological, neurological, ophthalmic, orthopædic, psychiatrical, skin and venereal diseases

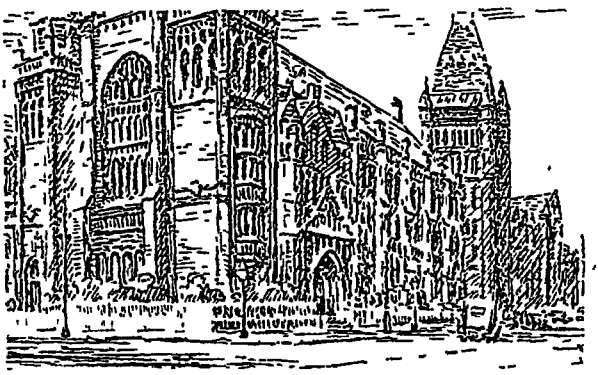
UNIVERSITY OF MANCHESTER

The school owed its beginning to the foundation of the Manchester Royal Infirmary in 1752, when apprentices were admitted to the small hospital In 1783 lectures were delivered in preliminary medical subjects, a small school of anatomy was begun in 1814 and an organised scheme of medical education in 1824 This was the first provincial school of medicine and was recognised as such by William IV in 1836 In 1872 the school was *amalgamated with* the Owens College, which was granted a charter as a university in 1880

At the present time, the school buildings as extended in 1920 are used mainly for the teaching of anatomy, histology, physiology, pharmacology, and practical pharmacy Each of these departments has its own lecture theatre, laboratories, and library In addition there are a large medical library and reading-room for students and common rooms for undergraduates The teaching of pathology and bacteriology is given in separate buildings close to the Royal Infirmary, which is the principal undergraduate teaching hospital for clinical work Instruction is also given at the St Mary's Hospitals for women and children (where students are accommodated for their two months' midwifery residence), the Royal Eye Hospital, and at the municipal fever hospitals and mental hospitals There is a hostel for final year students in close proximity to the Royal Infirmary, where residence for three months is compulsory

Admission to medical courses—A candidate must have satisfied the general requirements for entry to the University by gaining a school certificate, and in addition (*a*) a full higher school certificate, or

(*b*) four subjects at a subsidiary standard of the higher school certificate All information regarding these examinations should be obtained from the Joint Matriculation Board, 315, Oxford-road, Manchester. For entry to the faculty of medicine, the subjects of English, mathematics, mechanics or physics, and either Latin, Greek, French or German



must have been passed with credit in the school certificate or other recognised examination of the same or higher standard

About 70 per cent. of students live at home during their course The remainder are advised to live in one of the Halls of Residence, of which there are five for men (accommodating about 330) and four for women.

Entrance scholarships—(*a*) Dreschfeld scholarship (triennial) of £20 for two years, (*b*) John Russell scholarship of £45 for one year, (*c*) Sam Gamble medical scholarship for women; (*d*) two entrance scholarships in medicine covering fees up to 160 guineas for graduates in science and arts Scholarships are also awarded on the result of examinations held in May. Full particulars may be obtained from the registrar.

Other scholarships—Two Dauntesey medical junior, £50 each (on results of first examination), Dauntesey medical senior, £50 (on results of second examination), Professor Tom Jones exhibition in anatomy, £25, Dickenson Trust scholarships in anatomy and pathology; Platt physiological, £90, graduate research scholarship, £70, Dickenson Trust travelling scholarships in medicine and surgery, Ashby Memorial in diseases of children (triennial), £100, Holt post-graduate medical scholarship for Women, £60

Fellowships—Leech Research, £100; Professor Tom Jones surgical fellowship, £150, Morrison Watson in anatomy, £150, John Henry Agnew fellowship in diseases of children, £130; Delépine fellowship in preventive medicine, £300, Pilkington fellowship in cancer research, £300, Knight fellowship in psychological medicine (triennial), £150

Fees—Tuition fees are as follows. first year, £47 13*s*; second year, £32 18*s*.; third year, £93 18*s*; fourth year, £32 2*s*, fifth year, £91 9*s* (including residence in hostel £30). Examination fees for the M B degree amount to £42

The approximate cost of the whole course (6 years) including books, &c, is £365

The *cost of living* in a hostel is about £70–£80 a year; in lodgings from 30*s*. to £2 a week

Qualifying examinations—There are four examinations for the degrees of Bachelor of Medicine and Bachelor of Surgery (M B, Ch.B) First- and second-class honours may be awarded at the passing of the final examinations; distinction may be granted in any subject of the second, third, or final examinations The examinations are: (i) Part 1, chemistry (inorganic and organic) and physics; Part 2, (*a*) botany, (*b*) zoology. These parts are taken separately. (ii) Anatomy, with histology and physiology. (Must be passed at one and the same examination) (iii) (*a*) Pharmacology, (*b*) pathology and bacteriology. These are taken separately. (iv) (Final examination) Part 1, (*a*) forensic medicine, (*b*) hygiene and preventive medicine; Part 2, (*a*) medicine, (*b*) surgery, (*c*) obstetrics and gynæcology. The subjects of each part of the final examination must be passed at one and the same time It is essential to reach a pass standard in the clinical examination of each subject of Part 2

Doctor of Medicine—Candidates must have obtained the degree of M B at Manchester at least a year before admission They may either (*a*) present an original dissertation, or (*b*) undergo an examination in the principles and practice of medicine, pathology, and some other subject selected by the candidate

Master of Surgery—The conditions of admission are the same as for the degree of M D The degree is conferred in the following branches: surgery; gynæcology, ophthalmology, laryngology, otology, and rhinology

In addition the University grants the degrees of B Sc and M Sc. in the schools of anatomy and physiology, and awards diplomas in psychological medicine, public health, and bacteriology.

Clinical studies are carried out in the hospitals set out below, and at St Mary's Hospital for Women and Children, the Skin Hospital, the Eye Hospital, the Tuberculosis Clinic and Hospital, and the Babies' Hospital.

The Manchester Royal Infirmary is the oldest teaching hospital in the provinces, having admitted students to its wards from the eighteenth century onwards The present Institution is situated, to the great convenience of students, within five minutes' walk of the University, and adjoins other hospitals associated with the University. It has accommodation for 586 beds, of which 26 are allotted to the special and emergency departments, 230 to medical, and 330 to surgical practice Associated with the Infirmary are: (1) the Convalescent Hospital at Cheadle containing 136 beds and (2) the Central Branch in the City containing 54 beds

The medical side consists of four units, each with male and female wards, a test-room for routine chemical and microscopical investigations, and a class room The surgical side also has four units, each with its own operating theatre, with sterilising, anæsthetising, recovery, apparatus, and test rooms, and a class-room The aural, orthopædic, neuro surgical, and out-patient departments each have their own operating theatre Bacteriological investigations are carried out in a special clinical laboratory A department for the study of heart disease, with an electrocardiograph and other instruments for research, diagnosis, and teaching purposes is attached to the medical wards The X ray department has nine separate X ray outfits for different purposes and one large room is put aside specially for X ray demonstrations and teaching. There is a large modern physio therapeutic department and also a department of plastic surgery

Women students are admitted on the same terms as men Two *entrance scholarships* in medicine of the value of £160 each are offered annually by the Council of the University and the Medical Board of the Infirmary for proficiency in arts and science subjects respectively

The following *resident appointments* are made annually: resident medical officer, resident surgical officer, resident casualty officer, two resident clinical pathologists, senior and junior resident medical officers at the Convalescent Hospital, senior house surgeon for the central branch, surgical registrar to out-patients Four house physicians are appointed

every six months, and sixteen house surgeons to general surgical units every nine months House surgeons for the neuro-surgical and orthopædic departments are appointed every six months A house surgeon for the special departments is appointed every three months, and various non resident appointments, including eleven chief assistantships, are made annually

The Royal Manchester Children's Hospital was founded in 1829 in Ridgefield, Manchester, but the present hospital at Pendlebury was not opened until 1878 The Dispensary in Gartside street, Manchester, was opened in 1907, replacing an old building erected in 1868 Of the two convalescent homes, that at Lytham St Annes was presented to the Hospital in 1897, whilst the Zachary Merton Home at Pendlebury was completed and formally opened in March, 1936 The Hospital is recognised by the Royal College of Physicians for the Diploma of Child Health The total bed complement is 262 including an Isolation Block of 12 beds, the Seaside Home with 30 beds, and the Zachary Merton Home with 40 beds There are special departments for massage, artificial sunlight, electro therapy, and speech-therapy, and a separate ward and department devoted to the treatment of orthopædic cases

Resident medical officers at the Hospital, and non-resident clinical assistants at the Dispensary, are appointed for periods of six months

Ancoats Hospital, Manchester, is a general hospital of 151 beds and a Convalescent branch which is situated at Great Warford, Alderley Edge, Cheshire, and has 35 beds

The medical side consists of three units under the care of three honorary physicians with three out-patient clinics of a consultative nature A cardiographic department is under the care of one of the physicians Much work is done in gastro enterology, neurology, and diseases of the blood The surgical units are four in number, each under the care of an honorary surgeon, the orthopædic department, which deals with all fractures and bone injuries, is very large One surgical unit is devoted to abdominal surgery, and one to oto rhino laryngology, while a urological department is under the care of one of the honorary surgeons All these units have a largely attended out patient department Clinical teaching is given both to under graduate and post-graduate students in all the out patient clinics which are free to them, and in the wards, while post graduate lectures are given in the autumn and spring Clinical assistantships are available for post-graduates

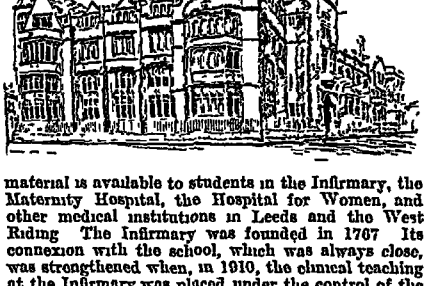
There are seven resident appointments which are open to men and women graduates, and twelve part-time registrar appointments (medical, surgical, orthopædic, and laryngological), which are renewable annually

UNIVERSITY OF LEEDS

The school of medicine began in 1831 in a few back rooms in the old Public Dispensary It proved a success from the first The need for larger accommodation, which has been an ever present problem, was soon evident, and the school was moved in 1834 to a house in Park parade and later, in 1865 to a new building in Park street, the first in this country to be erected expressly as a medical school In those days the medical student, who was most often the apprentice of a general practitioner, was brought at once into contact with clinical work The importance of preliminary scientific study was recognised however and in 1875 the student was required to attend classes in chemistry, biology, and comparative anatomy at the new Yorkshire College of Science These additions to the curriculum led to the incorporation in 1884 of the school with the college which, after forming part of the Federal Victoria University for seventeen years, was finally established in 1904 as the University of Leeds

The present school was built in 1894 It catered mainly for anatomy and physiology, leaving only a small space for pathology and none for bacteriology The subsequent enormous expansion of the two latter departments and the admission of women students made its further enlargement inevitable Extensive additions were made in 1930 and three years later a separate Institute of Pathology was opened accommodating the departments of pathology, bacteriology, and cancer research The new school of dentistry was opened in 1928 The number of medical students at the University is now 501, of whom 93 are women

The school is separated from the General Infirmary by the width of a street only, and a wealth of clinical



material is available to students in the Infirmary, the Maternity Hospital, the Hospital for Women, and other medical institutions in Leeds and the West Riding The Infirmary was founded in 1767 Its connexion with the school, which was always close, was strengthened when, in 1910, the clinical teaching at the Infirmary was placed under the control of the University and later when, with the help of the University, it provided an instructional block containing accommodation for clinical lectures and tutorial instruction as well as a clinical laboratory for the use of clerks and dressers Within the past few years over £250,000 has been raised for further expansion and extensive new buildings are now in course of erection

Clinical instruction in obstetrics is given at the Maternity Hospital, in gynæcology at the Women's Hospital, in mental diseases at the West Riding Mental Hospital, Wakefield, and in infectious diseases at the City Fever Hospital at Seacroft All other special departments are within the Leeds General Infirmary

Admission to the University is conditioned by the regulations of the Northern Universities' Joint Matriculation Board which now require a student to have obtained a school certificate and thereafter either a higher school certificate or a pass at one and the same higher school certificate examination in four subjects, at or above the subsidiary standard Students reading for external degrees and other registrable qualifications are accepted if accommodation is available At present such accommodation is very limited

Scholarships.—As compared with the older universities, the University of Leeds has few scholarship endowments Entrance scholarships are in the main confined to the

children of Yorkshire parents—e g , the Frank Parkinson and John Gilbert Vause Memorial scholarships. Many entrance scholarships are awarded by the various city and borough councils and county councils. A number of prizes and scholarships are awarded during the course of studies.

Tuition fees and cost of living—The approximate total cost of the medical course, not including the Joint Matriculation Board's examination fees, is £385, which includes registration fee, £2; composition fee (paid by annual instalments), £265; maternity hostel fee (3 months), £35 15*s.*; examination fees, £18; books, instruments, &c , £64; and convocation fee, £1.

The University has provided halls of residence for men and women students. The fees for men are £60–£68 per session of 32 weeks and for women £64–£67 according to the accommodation chosen On this basis the cost of living over the whole period of the medical course, exclusive of vacations, amounts to about £460 for men and £425 for women. About three-quarters of the students reside at home during the period of their medical training

Qualifying examinations—There are four examinations for the degree of M B The first includes physics, chemistry, botany, and zoology; the second, materia medica, anatomy, and physiology; the third, pathology, bacteriology, and pharmacology; and the fourth (Part 1), public health and forensic medicine, and (Part 2), medicine, surgery, and obstetrics Part 2 of the final examination is normally taken three months after Part 1 and may not be taken before the end of the third clinical year or before the completion of the fifth year of medical study proper.

Higher degrees—Admission to the degrees of *Doctor of Medicine* and *Master of Surgery* is limited to graduates of the University. A candidate for the degree of M.D. must have completed either (*a*) two years of approved hospital practice or approved special study or (*b*) four years in the practice of their profession in one or other of its branches. A candidate for the degree of Ch.M is not admitted until two years have elapsed from the date of his graduation as M B. In dental surgery the University grants two degrees, B.Ch D. and M Ch D., and a diploma, L D.S.

The General Infirmary

This hospital has accommodation for 673 beds, of which 438 are allotted to general medical and surgical cases, adults and children, the remainder being given up to ophthalmic, aural, orthopædic, radium, dermatological, and neuro-surgical cases. In that total is included the patients in the auxiliary branch hospital, the Ida and Robert Arthington, containing 101 beds. The University and hospital paid appointments in connexion with the infirmary and other bodies are numerous. Associated also with the infirmary is the Women's Hospital of 84 beds for the treatment of gynæcological and obstetric diseases; students when eligible attend the practice of this hospital, to which there are three paid resident appointments Recognised students may attend the clinical teaching in the out-patients' department of the Leeds Public Dispensary and Hospital During the autumn and spring terms, regular post-graduate lectures and demonstrations are held at the General Infirmary, and at the Public Dispensary and Hospital, which are open to all general practitioners resident in the district.

Leeds Maternity Hospital contains 140 beds for cases of labour, while there is other accommodation attached for the treatment of morbid pregnancies. There is an X ray department, and large extern districts are centred upon the institution The hospital is affiliated to the University for purposes of clinical training, and every student takes an obstetric clerkship and attends in the intern and extern departments During the second and third months personal contact with not less than 20 cases of labour is required, the students being resident in the neighbouring hostel.

West Riding Mental Hospital

The well-known hospital at Wakefield accommodates 2600 patients, a separate building, containing 400 beds, being provided for the treatment of acute insanity. Clinical clerkships in the wards and laboratories can be filled by qualified practitioners or, on application to the medical superintendent, by senior students This hospital is a recognised institution for the purpose of training for the diploma in psychological medicine Courses of lectures in mental diseases and laboratory work can be taken at the hospital, forming part of the University of Leeds course for the diploma.

UNIVERSITY OF SHEFFIELD

The earliest medical school in Sheffield, known as the "Church-street School" was founded in 1828, when the foundation-stone was laid of the building in Surrey-street in which the school of medicine carried on its work, with varying fortunes for 60 years. In 1888, as the result of an appeal to the public, a large building was erected in Leopold-street. In 1897 a Royal Charter of incorporation was granted to University College, Sheffield, the medical school being amalgamated for that purpose with Firth College and the Technical School. A University Charter, giving powers to confer degrees, was granted to the College in 1905, when the present University buildings in Western Bank were opened.

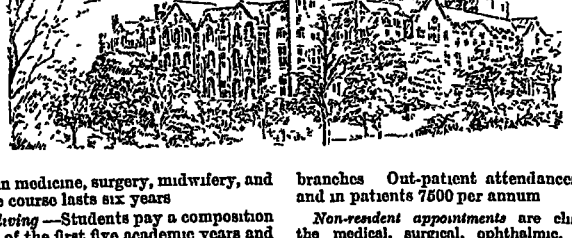
For the five years before the Great War the average number of students in the school was only about 40 and, after participating in the post-war increase, the school remained stationary for many years with 70–80 students; since 1932, however, the numbers have rapidly risen to the present 180. It is interesting to note that up till about 1930 at least half of the students were reading for the degrees or diplomas of other examining bodies, whereas now two-thirds are reading for Sheffield degrees. About fifteen years ago the medical curriculum in Sheffield was revised and the course increased to five and a half years The new curriculum abolished the artificial distinction between clinical and preclinical subjects and stressed the close inter-relationship and mutual dependence of the two groups of subjects. Twenty years ago a chair of pharmacology was established, the holder of which was appointed an honorary physician to one of the teaching hospitals with in-patient and out-patient facilities for teaching and research. At the moment new buildings are being erected so that all laboratory accommodation may be increased, and a new department of biochemistry has been established.

Admission—Students who intend to read for the Sheffield degree must fulfil the requirements of the Joint Matriculation Board. They will be qualified to enter the degree course if they hold (*a*) a school certificate and (*b*) either (1) a higher school certificate or (2) have passed at one and the same higher certificate examination in four subjects at or above the subsidiary standard. Students who have done chemistry and physics at school up to a standard approximately equivalent to that of the subsidiary higher certificate may enter on their first year work at the University in October, taking the pre-registration examination in March and the 1st M.B. in June. In the case of students who have done the whole of their chemistry and physics at school, and who

take the pre registration as external students, an additional subject such as English, history, or a language other than English will be required

Scholarships—(*a*) Four Town Trustees scholarships offered annually, each of £50 per annum for three years (*b*) Medical scholarship, offered annually, covers cost of tuition for a degree course (*c*) Six Edgar Allen scholarships offered annually, each of £100 per annum for three years

Qualifying examinations—Candidates for the degree of M B must pass the pre-registration examination in chemistry and physics, and thereafter the following four professional examinations first examination in biology, chemistry and physics, second examination in anatomy and physiology; third examination in pathology, bacteriology and pharmacology, applied anatomy and applied physiology, final examination in forensic medicine and public health and in medicine, surgery, midwifery, and therapeutics The course lasts six years



Fees and cost of living—Students pay a composition fee of £42 for each of the first five academic years and £28 for the sixth year

For a student living at home a total expenditure of about £380 will cover fees for tuition, examination, books, laboratory fees, and other incidental expenses Lodgings may be had from 25*s* to £3 3*s* per week, while residence in the fine new men's hostel, Crewe Hall, costs £66 per University session with an additional £2 per week during vacations The fees at the women's hostel are similar Approximately two-thirds of medical students are drawn from the immediate vicinity of Sheffield and live at home

Candidates for the degree of *Doctor of Medicine* must have passed the examination for the degree of M B at least two years previously and must subsequently have spent a year either in approved hospital practice or in scientific work at a university They must then either pass an examination in medicine, general pathology and experimental medicine and some special subject, or present a thesis

Candidates for the degree of *Master of Surgery* must have passed their M B at least three years previously and must subsequently have held surgical appointments at a hospital for at least a year They must then pass an examination in (*a*) general surgery and (*b*) a special branch of surgery

A vast amount of clinical material is available in the Sheffield medical school because it has been the policy of the school to give first consideration to maintaining a high standard of clinical teaching rather than to increasing unduly the number of students There are two general hospitals the Sheffield Royal Infirmary and the Sheffield Royal Hospital, these two institutions have recently been amalgamated and a new teaching hospital will, in the near future, result from the scheme for reorganisation at present being drawn up Special facilities are given for the teaching of orthopædics radiotherapy and dentistry The Jessop Hospital for Women caters for the teaching of midwifery and gynæcology and midwifery cases are available for students at the Municipal Hospital A separate Children's Hospital with 118 beds and the City Fever Hospitals (790 beds), the City Hospitals for Tuberculosis (510 beds), and the South Yorkshire Mental Hospital (2000 beds) are all available for teaching purposes

Sheffield Royal Infirmary

In January, 1939, the Royal Infirmary and the Royal Hospital were united in one corporation called the Royal Sheffield Infirmary and Hospital The present Infirmary has 500 beds and is fully equipped for the training of medical students and includes a training school for nurses and radiographers

New operating theatres were opened in May bringing the number of general theatres to six, the special departments have their own operating theatres The hospital serves a very wide area thus offering much clinical material in medicine and surgery in all its branches Out-patient attendances number 230,000 and in patients 7500 per annum

Non-resident appointments are clinical assistants to the medical, surgical, ophthalmic, aural, orthopædic, dermatological, and X ray departments

Resident appointments are resident surgical officer, three casualty officers, four house physicians, five house surgeons, and three house surgeons to the ophthalmic, aural, and orthopædic departments

There is a 3 months' course during the winter for post-graduate instruction There are also two post-graduate courses a year under the new Government scheme

Sheffield Royal Hospital

The hospital, which was founded in 1832, now has 300 beds, with a further 45 beds at the annexe and 48 at the Zachary Merton Convalescent Home, both situated at Fulwood A new seven floor block was opened last October containing the very latest X ray and radium equipment and wards laid out on modern lines There are 30 beds for paying patients and, in addition to the usual special departments, clinics for orthopædic and fracture cases, for diabetes, varicose veins, encephalitis lethargica, and for neuropsychological, gastro intestinal, and orthoptic treatment

There are 11 resident medical officers and 3 non resident dental officers Post graduate lectures are given regularly by the honorary staff, who are professors and lecturers at the University

Jessop Hospital for Women

The hospital has 151 beds, 51 for maternity, 77 for gynæcological, and 23 for puerperal sepsis cases The maternity beds include 15 reserved for antenatal patients Of the maternity admissions 25 per cent are emergency cases The puerperal sepsis cases are housed in a separate building, the Firth Auxiliary Hospital, to which is attached a bacteriological research department and a pregnancy diagnosis station There is, in addition a well equipped pathological laboratory in the hospital. About 1200 patients are delivered annually in the hospital,

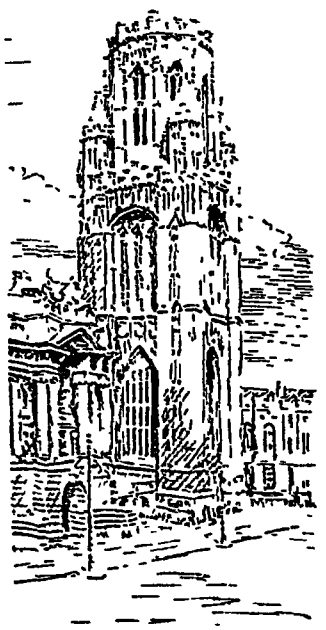
and some 200 on the district by hospital nurses in the City Domiciliary Service The gynæcological department deals with 1800 in-patients and over 2000 new out-patients in the year. Antenatal, post-natal, and venereal diseases clinics are held several times a week, and recently an infant follow-up clinic has been established under the care of a pædiatrician. The hospital is affiliated to the University for purposes of clinical training, each student being required to attend for a period of six months, and to reside in a neighbouring hostel for two months so that he may personally undertake the management of 20 cases of labour During each winter session there is a post-graduate course of clinical instruction.

The *resident staff* consists of a senior resident officer to the maternity department, four gynæcological house surgeons, and a house surgeon in charge of the antenatal and puerperal sepsis beds

UNIVERSITY OF BRISTOL

Lectures in medicine were given at isolated schools and by independent teachers in Bristol from about 1737. A very strong school was formed in 1837 by the combination of lecturers from various groups, and before long all its competitors had disappeared. For fifty years this school continued to provide a sound medical education for West of England men though it had no power to grant qualifications of its own and no endowments In the seventies, when funds were needed to rebuild the old school, the idea arose of joining with those who were anxious to found a college of literature and science The scheme flourished, and in 1879 the school took over the first buildings on the new University College estate Twelve years later the school became fully incorporated with the College and Dr. Edward Fawcett was appointed the first professor of anatomy, and in 1909 it was merged in the newly created University, which now could grant medical degrees.

Admission.—Apart from a limited number of candidates for medical degrees of the Universities of Oxford and Cambridge, who wish to take only the clinical part of their course in Bristol, no students are at present being admitted to the faculty of medicine unless they are reading for the medical or dental degrees of the University or for the University's diploma in dental surgery. To be eligible for matriculation students must be at least 17 years of age and have passed a recognised school certificate examination with credit in five subjects or some other examination which is regarded by Senate as equivalent thereto. Credit standard is required in mathematics, a foreign language, and either English as a full subject or English language together with history.



Application for admission may be made either to the dean of the faculty or to the registrar at the University buildings Early application is advised.

Entrance scholarships.—(*a*) Two Dulverton open scholarships of £100 per annum for three years (*b*) Miriam Badock scholarship of £120 per annum for three years, and Henry Herbert Wills science scholarships, confined to students from Clifton College (*c*) Harold Greenwood memorial scholarship of £20 per annum for those who received instruction at a State-provided school in Clevedon or elsewhere in Somerset, and subsequently at a secondary school in Somerset or Bristol. (*d*) Skillicorne memorial scholarship of £35 per annum, awarded to a pupil of Cheltenham Grammar School. (*e*) Bristol city senior scholarships and those offered by the counties of Gloucestershire, Somerset, Wilts, and Dorset and the city of Bath are also tenable in the University.

Post-graduate scholarship and fellowship.—(*a*) Michael Hiatt Baker scholarship of £200 per annum for two years, renewable for a third year, tenable by a graduate from New Zealand. (*b*) University graduate scholarships, for graduates of not more than one year's standing, awarded for one session, but renewable for a second session (*c*) Ashworth Hallett scholarship of about £40, open to women only. (*d*) Beaverbrook fellowship (being the interest on £1000), intended primarily for research in clinical subjects; tenable by any member of the University holding a medical qualification, awarded for one year, but renewable for not more than three years. (*e*) Colston medical research fellowships, of not less than £100 per annum, primarily for clinical subjects, awarded by the Council of the Colston Research Society, and renewable yearly.

Qualifying examinations.—Candidates for the degrees of M.B., Ch B. must pass three examinations A higher school certificate in physics, chemistry, and biology will exempt a candidate from the first M B course and examination, provided he has reached a sufficient standard in organic chemistry and has studied to a standard beyond that of the first school certificate examination at least one of the following subjects, viz: English, history, geography, Latin, Greek, French, German, any other approved language, mathematics.

The *first examination* completes the first year's work—i e, physics, chemistry, and biology—and successful candidates are thereafter registered with the General Medical Council The examination in inorganic and physical chemistry and the examination in physics, organic chemistry, and biology are regarded as parts of the same examination, which must be passed as a whole, save that a candidate who has failed in one subject only may be allowed to offer himself for re-examination in that subject alone

The *second examination* is taken at the end of the third year of study The subjects of the examinations are:—Group I. anatomy and physiology, and Group II: elementary pharmacology and elementary pathology The examination must be taken and passed as a whole except that the candidate who has passed in Group I only may be allowed to offer himself for re-examination in Group II only.

The *final examination* is divided into two sections, which may be taken together but are usually taken separately. Section I includes materia medica and pharmacy, pharmacology, pharmacotherapeutics and toxicology, pathology, and bacteriology, and may be taken 2½ years after the second examination has been passed. The candidate must pass in all the subjects of Section I at the same time Section II

is divided into two groups, both of which must be passed within a period of 19 months A candidate who takes the whole of Section II at the same time and fails in one subject only may be allowed to present himself for re examination in that subject alone Section II may not be taken until the candidate has pursued the curriculum for five years after passing the first examination The subjects of this section are — Group I surgery, including ophthalmology and oto-rhino laryngology, and obstetrics, Group II medicine, including mental diseases, public health, and forensic medicine.

Fees and cost of living—Fees are normally paid by annual instalments, the fees for matriculation, registration, lectures and laboratory work, hospital practice, clinical instruction and appointments, dispensing, museum, fever hospital, psychiatry demonstrations, and vaccination, together with the annual subscription to the University of Bristol Union, examination fees, and the fee for admission to the degrees of M B, Ch B and for registration as a member of Convocation and Parliamentary voter, amount to £279 The cost of books and laboratory apparatus may be estimated roughly at £65 or £70

During the past few years 50–75 per cent of students have graduated from their homes Others must reside in a University Hall of Residence, unless required or permitted by the Vice Chancellor to live in registered lodgings The Halls of Residence for men are Mortimer House and Wills Hall, and for women Clifton Hill House and Manor Hall The inclusive fees for board and residence are £75–£89 per session for men and from £66 per session for women

Medical students must, at least in the last three years of the course, reside in Bristol during the vacations

Higher degrees—The University also grants the degree of *Master of Surgery*, which may be taken in either surgery, ophthalmology, oto rhino laryngology, or gynæcology, and *Doctor of Medicine*, which may be taken either by dissertation or by examination in general medicine or in State medicine These are open to medical graduates of the University two years after graduation

The degree of *Doctor of Philosophy*, for which two years' full time research is required, may be taken in the faculty of medicine

The degree of *Master of Dental Surgery* (*M D S*) is open to Bachelors of Dental Surgery of the University of two years' standing

Associated hospitals—Clinical instruction is given at Royal Infirmary and General Hospital, shortly to be amalgamated, Royal Hospital for Sick Children and Women, Eye Hospital, Fever Hospital at Ham Green, City and County Mental Hospital, Southmead Hospital, Stoke Park Colony for mental defectives, Winford Orthopædic Hospital, Winsley Sanatorium

Bristol General Hospital

The hospital was founded in 1832 with 20 beds and dealt with 192 in patients and 2532 out-patients in that year It now has 269 beds and deals with over 6000 in patients and over 40,000 out patients annually The hospital is in process of amalgamation with the Bristol Royal Infirmary and recently a new joint department was opened to do all the radiological work of the two institutions This department is equipped with the latest apparatus for high voltage therapy, superficial therapy and contact therapy and also houses the National Radium Centre In addition there are also special departments for skin diseases, affections of the ear, nose, throat, and eyes, electro cardiography, light treatment and physiotherapy

There are 9 resident medical officers and 1 non-resident dental officer Students attend for their clinical work at the hospital and are attached to members of the honorary staff who are professors and lecturers in the University

Bristol Royal Hospital for Sick Children and Women

Founded in 1857, this was the second children's hospital to be established in England Situated on a commanding site within a stone's throw of the University, the hospital serves a wide area and has over 100 children's beds Instruction in diseases of children is given by the staff in the wards and out-patient department Clinical clerkships are held in rotation by all medical students during their fifth and sixth years After qualifying, they are eligible for the posts of house physician or house surgeon which are tenable for six months, the appointments being made in April and September The hospital fulfils the requirements for the diploma in child health of the Conjoint Board

Bristol Royal Infirmary

Founded in 1736, this was the first voluntary hospital in the country, outside London, to receive in patients It was officially opened on Dec 13, 1737, and so celebrated its bicentenary in 1937 The original buildings proved quite inadequate after a few years to accommodate all the patients requiring admission. They were pulled down and new ones erected of which the central wing was completed in 1792 They have since been largely extended and now contain accommodation for 436 patients More than 10,500 in patients and 68,000 out-patients are dealt with each year The maternity work undertaken by the institution represents approximately one in five of the total births in Bristol, and correspondingly large antenatal and postnatal departments are maintained In the massage department nearly 100,000 treatments were given during the year

An amalgamation is being arranged between the Royal Infirmary and the Bristol General Hospital and the medical staffs are already considered as one The fracture departments of the two hospitals have been combined at the Royal Infirmary and the radiological departments at the General Hospital The geographical peculiarities of Bristol, which is divided into two parts by an inadequately bridged river, makes it difficult to erect a single "hospital centre" that would serve the whole city satisfactorily When the amalgamation has been completed it is suggested that all medical and surgical cases should be admitted to the Infirmary and all the special departments should be at the General Hospital The two will be known as the Bristol Royal Hospitals.

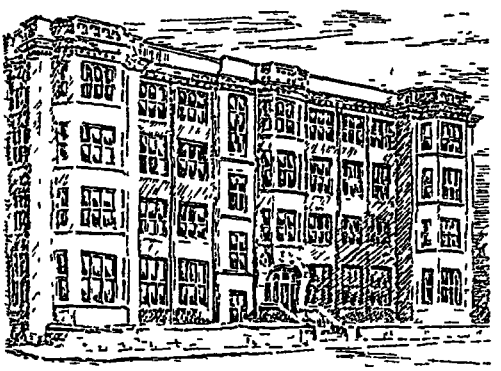
UNIVERSITY OF WALES

THE WELSH NATIONAL SCHOOL OF MEDICINE

This, the youngest of the schools of medicine, has had an interesting career and its fortunes are bound up with those of the federal University of Wales The University College, Cardiff was opened in 1883 and became a constituent institution of the University of Wales when the latter was established in 1893 From the first the College had departments of chemistry, physics, and biology in which medical students were trained From 1892 zoology and botany were separate departments and in 1894 departments of anatomy, physiology, and materia medica were started

In 1916 a Royal Commission on university education in Wales was appointed under the chairmanship of Lord Haldane It drew much of its inspiration on medical education from Sir William Osler, one of its members. The commission recommended a complete National school of medicine on the "unit system"—clinical units headed by full-time professors. The war delayed matters The complete school was started in 1921 with units in medicine and surgery and with the Cardiff Royal Infirmary as its principal clinical institution.

At first the school was a part of the Cardiff College but difficulties arose as regards its government and its position in the federal University scheme Eventually, in 1931, these were resolved by the retention of the departments of anatomy and physiology in the Cardiff



College under a joint academic committee of college and school and the formation of a separate institution, "The Welsh National School of Medicine," for clinical teaching In spite of the difficulties of its inception, the school has grown and prospered. At present there are over 300 medical students of all years of whom about 170 are in the clinical school.

Associated with the students' union society of Cardiff College is a medical students' club to which all students must belong. Student amenities have recently been supplemented by a refectory and residence which were much needed Other hostel accommodation is available Aided by a National Fitness Council grant a squash-rackets court has been erected near the residence

Admission.—Students enter the school by obtaining matriculation, or its equivalent, in the University of Wales Two of the following five subjects (of which one must be either physics or chemistry) must be included in the matriculation certificate: physics, chemistry, botany, zoology, biology. Subject to this condition of admission, students may be admitted who are preparing for examinations of licensing bodies other than the University of Wales.

Entrance scholarships and free studentships are available and there are numerous prizes and medals awarded during the student's course *There are also post-graduate research* scholarships in medicine and medical pathology, in cancer, in tuberculosis, and in obstetrics and gynæcology.

Qualifying examinations.—After three years' study and passing anatomy and physiology at a high standard, Welsh degree students obtain the degree of B.Sc, and then proceed to their clinical studies for the M.B, B.Ch. Candidates are required to pursue a course of study of not less than six academic years after their matriculation They must hold an arts or science degree of the University of Wales or of some other university approved for the purpose, but certain of the courses pursued for a B Sc or B A. degree may be counted as required for the medical degrees.

Fees.—The total tuition and examination fees for the whole of the six years amount to just under £300. The cost of living during this period may be roughly estimated at £100 a year. A certain number of students live at home

Higher degrees.—Candidates for the degree of *Doctor in Medicine* must pass an examination in clinical medicine and submit a thesis embodying the results of original observation or research A candidate must have obtained the degree of M.B in the University at least two years before submitting the thesis

The requirements for the degree of *Master of Surgery* are similar to the above, but the candidate must pass an examination in surgical anatomy, bacteriology, and surgical pathology, surgery, clinical surgery, and operative surgery.

Clinical instruction is given at a number of institutions, including Cardiff Royal Infirmary, Llandough Hospital (345 beds), a modern municipal hospital, the Prince of Wales' (Orthopædic) Hospital (138 beds), the Lord Pontypridd Children's Hospital (Rheumatism, 25 beds), and the various Tuberculosis Hospitals (608 beds). There are large and well-equipped mental and fever hospitals and full hospital provision for obstetric training.

Cardiff Royal Infirmary

The hospital has over 400 beds and large modernisations and additions to its buildings, which are to result from its Centenary Appeal, will add to its accommodation In 1938 the Infirmary admitted 6447 patients and treated 41,896 out-patients.

All inquiries and communications should be addressed to the secretary, The Welsh National School of Medicine, The Parade, Cardiff.

THE CARNEGIE TRUST

The Trust makes grants towards the class fees of approved students in the various Scottish Universities In the faculties of medicine the annual allowances are £20 a year for four years. Applicants must be over 16 and must be of Scottish birth or extraction or have attended a school or institution under the inspection of the Scottish Education Department for at least two years after reaching the age of 14 The parents or guardians of applicants are required to make a confidential statement of their financial circumstances Particulars from the Trust Offices, 22, Hanover-street, Edinburgh.

" . Examinations are works of necessity but not of mercy. Like all necessary things, they are apt to be tyrannical, tyrannising over both students and teachers, and often robbing the student of the best fruits of learning But while all admit the defects of examinations, no one has invented anything that will take their place And after all no student of mettle really wishes to escape the ordeal of examination · it is an honourable trial of his knowledge, it is also a test of moral qualities—courage and quickness, steadiness and suppleness of mind—qualities that will serve you well in your future practice Examinations are a searching test of the teacher also, and of his methods and success in teaching, experience in examinations is an important part of the education of a teacher. But the chief fault and danger in medical teaching, where subjects of great scope and complexity are dealt with in a short time, is that of giving more food than can be digested The golden rule in teaching is Attend to the understanding, and the memory will take care of itself"—Prof CHAS. MCNEIL in his promotor's address at Edinburgh Medical Graduation, July 19, 1939

MEDICAL SCHOOLS OF SCOTLAND

A STUDENT who wishes to enter upon a course of study to qualify for graduation in any faculty of a Scottish university must first obtain a certificate of fitness from the Scottish Universities Entrance Board A certificate is granted either on the result of the Board's preliminary examination or on evidence of having passed certain examinations elsewhere The preliminary examination is held at the four university seats twice a year, and four subjects must be taken, of which one must be English, one mathematics or physical science or dynamics, and one a foreign language Exemption from the examination is granted to holders of a degree at a recognised British or foreign university, a group leaving certificate of the Scottish Education Department containing passes in certain prescribed subjects, certain other certificates, or, in the case of a candidate educated in England, such qualifications as would admit him to the faculty of arts or science in an English university A similar rule applies to candidates from Wales, Ireland, and other countries Forms of application for a certificate may be obtained from the secretary of the Board, 31, North street, St Andrews, or from the secretaries of the universities

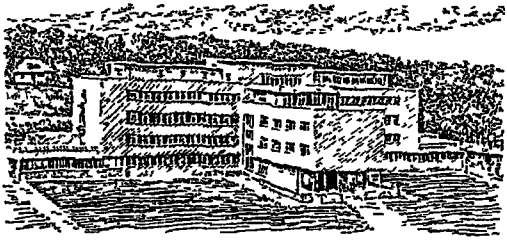
UNIVERSITY OF ABERDEEN

The University of Aberdeen was founded in 1494, and the chair of medicine represents the oldest foundation for the teaching of medicine in Great Britain The faculty of medicine embraces eleven chairs and numerous lectureships in the various branches of medical science, the most recent additions being lectureships in psycho-pathology and anthropology Now buildings to house the departments of surgery, medicine, midwifery, materia medica, pathology, bacteriology, public health, forensic medicine, and clinical chemistry have been erected and equipped on a site adjacent to the joint hospitals at Forester hill *It is intended to transfer the departments of* anatomy and physiology to the medical buildings at Foresterhill, and plans for the necessary extensions are in course of preparation There are now collected on this site the *Aberdeen Royal Infirmary*, the Royal Hospital for Sick Children, the Maternity Hospital, and the Royal Mental Hospital The town council is about to erect an antenatal annex to the Maternity Hospital The number of *medical students is now* 475 (370 men, 105 women)

Board and lodgings are plentiful at an average of 30s a week, and plans have been approved for the building of a hostel for final year students adjacent to the new medical buildings at Foresterhill The building will be completed in the course of the year A greatly enlarged students' union near Marischal College has now been completed Ample accommodation is available for athletics and a swimming pool for students is in course of construction The University buildings also contain a fully equipped gymnasium under the direction of two instructors

Bursaries ranging in value from £10 to £45 per annum, are available to students in the faculty of medicine, most of them tenable for 3–5 years Several fellowships and scholarships are awarded for post graduate study or research of the annual value of £200 and upwards In addition students who are eligible may apply for assistance from the Carnegie Fund (see opposite)

The course of study for the degrees of M B, Ch B covers a period of not less than five years and two terms The following four examinations must be passed—first biology, physics, and chemistry, second anatomy and physiology, third materia medica, pathology, forensic medicine, and public health and infectious diseases, fourth surgery, medicine, and midwifery



The total *fees* payable throughout the course of study, including class, matriculation, degree, and hospital fees, amount to approximately £250.

Clinical instruction is given at the following hospitals Aberdeen Royal Infirmary, Aberdeen Royal Hospital for Sick Children, Aberdeen Maternity Hospital, including antenatal department, Aberdeen Royal Mental Hospital, Aberdeen Dispensary and Vaccine Institute, Aberdeen Ophthalmic Institute, Aberdeen City Hospital for Infectious Diseases, and Woodend Hospital

For the degrees of *Doctor of Medicine* and *Master of Surgery*, candidates must hold the degrees of M B, Ch B of Aberdeen, present a thesis and pass a clinical examination in a special department of medical or surgical science *Candidates for the Ch M* are also examined in surgical anatomy, &c

A candidate for the degree of *Doctor of Philosophy* must previously have obtained a degree at Aberdeen University, or any other university specially recognised for the purpose, and must undertake special study or research for a period of not less than 9 academical terms He must submit a thesis containing a record of his work, and if required, must pass an oral or other examination

Aberdeen Royal Infirmary

The Infirmary, founded 200 years ago, is now housed in completely new buildings specially adapted for teaching purposes at Foresterhill The *University* medical school is immediately adjacent on the same site. There are 500 beds, with separate wards devoted to orthopædic surgery and genito urinary diseases and diseases of metabolism *There is also* a department of psychological medicine Regular courses of clinical instruction are arranged for undergraduates and there is a course for post graduates in the summer session Eighteen resident appointments are awarded to recently qualified men for periods of one year, and registrars are appointed from time to time as vacancies occur

Aberdeen Royal Mental Hospital

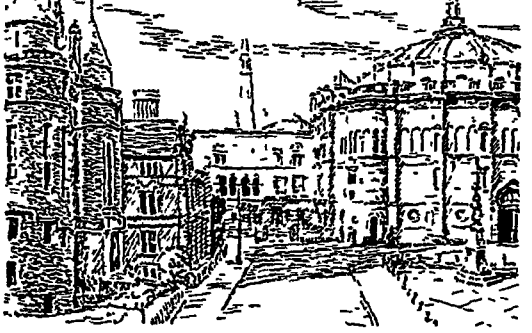
The hospital contains about 900 beds The class of mental diseases at the University of Aberdeen receives clinical instruction at the hospital. There are four resident assistant physicians and at least one undergraduate clinical assistant

UNIVERSITY OF EDINBURGH

The faculty of medicine was established in 1726 and in its formation the town council and the Royal Colleges of Physicians and Surgeons coöperated with the University. By 1869 the number of students and professors had increased to such an extent that an appeal for funds was made and the present buildings, which contain the majority of the medical class-rooms, were erected between 1878 and 1880. Since then several additions have been made to the buildings and many of the departments have been reconstructed to meet modern teaching requirements An ambitious scheme is now under consideration for extending the medical school buildings The number of students enrolled in the medical faculty in 1938–39 was 1298 (1079 men and 219 women). This includes those studying for higher degrees and diplomas, and occasional students Between 600 and 700 undergraduates are in the clinical years.

Considerable extension of the Royal Infirmary has also taken place during the last few years and a new maternity and gynæcological block, providing greatly improved facilities for teaching in midwifery and gynæcology, has been completed In addition extensions of the hospitals controlled by the municipality are well under way and altogether future students of medicine in Edinburgh are likely to have facilities for study far in advance of anything available to past generations of graduates

Admission —Prospective students are required to submit an application for admission on a prescribed form to the dean of the faculty of medicine. The entrance requirements include a preliminary or other examination recognised by the Scottish Universities Entrance Board and a pre-registration examination in physics and chemistry. The preliminary examination of the Scottish Universities Entrance Board consists of four subjects. English (including literature and history) is compulsory and either mathematics or



physical science must be taken, as well as a language—French, German, Latin, Greek, Italian, Spanish, &c.

Entrance bursaries —A large number of bursaries are awarded annually by the University and by outside patrons The University bursaries, and some others, are awarded on the result of the bursary examinations in general education held annually in May. A pamphlet giving full particulars may be obtained free from the matriculation office

The *qualifying examinations* are four and are held during or at the end of each of the five years of study. The first is taken in two parts, chemistry and zoology being held at the end of the first winter session in March and physics and botany at the end of the first summer session in July. The second examination, consisting of anatomy and physiology, is taken at the end of the second year in July. At the end of the third year the third examination takes place in pathology, bacteriology, materia medica, and therapeutics

The final professional examination is divided into two parts, the first part, in forensic medicine and public health, being taken at the end of the fourth year and the remainder of the subjects, midwifery, surgery, and medicine, at the end of the fifth and final year.

A feature of the Edinburgh curriculum is the arrangement of the work of the third year, which consists of coordinated courses in pathology, bacteriology, materia medica, therapeutics, medicine, and surgery extending over three terms. The sequence of study in the course of systematic medicine forms the basis of coördination In the fourth and fifth years students are required to spend a period of six months in attendance at one or other of the dispensaries in the city and during this period they have the opportunity of visiting the sick poor in their own homes. This type of training is most valuable and is a unique feature of the Edinburgh curriculum. In the course of midwifery also the students must spend a period of eight weeks in a hostel close to the Maternity Hospital for the purpose of following the practice of the hospital both during the day and night.

For some time past a scheme has been in existence under which a limited number of students can reside in the municipal general hospitals for periods of three months at a time. This has been most successful and it is intended to develop the arrangement as far as possible with a view to giving every student the opportunity of having at least three months in residence during his undergraduate training.

Fees and cost of living.—The total cost of the medical course is approximately £268, exclusive of the cost of books and instruments which may be estimated at £10–£20 per annum. The cost of board and lodging either in a private house or in a hostel is from £1 15*s.* to £2 5*s* per week.

Higher degrees.—Bachelors of Medicine and Bachelors of Surgery of not less than 24 years of age may proceed to the degrees of *Doctor of Medicine* and *Master of Surgery* after they have spent one year in the medical or surgical wards respectively of a hospital, or the military or naval medical services, or in scientific work bearing directly on their profession, or two years in practice In each case an examination must be passed and a thesis submitted for approval.

The main part of the hospital training of students is carried out in the Royal Infirmary, but for teaching in certain special subjects—e g., children's diseases, infectious diseases, tuberculosis, and psychiatry—the undergraduates attend the Royal Hospital for Sick Children, the City Fever Hospital, the Royal Victoria Hospital and Dispensary for Tuberculosis, and the Royal Edinburgh Hospital for Mental Disorders. The Municipal Hospitals are also utilised for training.

Edinburgh Royal Infirmary

The clinical instruction at Edinburgh University is carried on mainly at this institution. There are 1135 beds, including 71 cots for children Courses of clinical medicine and surgery are given by the physicians and surgeons to male and female students Special instruction is given on diseases of women, of the skin, of the eye, ear, nose, and throat, and the teeth. Separate wards are devoted to venereal diseases, diseases of women, diseases of the eye, the ear, throat, and nose, the skin, orthopædics, surgical neurology, and also to cases of incidental delirium or insanity There is also a large and complete radiological department in which is given theoretical and practical instruction for the University Diploma

in Medical Radiology, &c In addition to the out-patient departments connected with the surgical and medical houses, there are separate out patient rooms attached to the special departments Post mortem examinations are conducted in the anatomical theatre by the pathologist and his assistants, who also give practical instruction in pathological anatomy and histology

During the past year a unit comprising 20 beds, out-patient consulting rooms, &c, for neurological cases requiring surgical treatment has been opened The operating room is of novel design with equipment for air sterilisation, lighting by means of a reflector, vaulted ceiling and a gallery for spectators Associated with the Infirmary is a convalescent home of 80 beds and an auxiliary institution of 30 beds for radium treatment

The *appointments* are 1 Resident physicians and surgeons are appointed and live in the house free of charge The appointment is for six months, but may be renewed at the end of that period by special recommendation 2 Non resident house physicians and surgeons and clinical assistants are appointed for six months The appointment may be renewed for a like period by special recommendation 3 Clerks and dressers are appointed by the physicians and surgeons These appointments are open to all students and junior practitioners holding hospital tickets 4 Assistants in the pathological department

At the **Simpson Memorial Maternity Pavilion**, a new branch of the Royal Infirmary containing 136 beds, clinical instruction is given by the Professor of midwifery and other obstetricians who are members of the teaching staff of the Royal Infirmary In addition, clinics and demonstrations are given to students in the delivery, puerperal and antenatal wards and also in the antenatal and postnatal out-patient departments Before the university students can qualify for a certificate on the subject they must reside for a period of at least eight weeks in the hostel close to the hospital so that they can take full advantage of the practical instruction on the emergency work Accommodation is available for post-graduates

Royal Hospital for Sick Children

This hospital, which is situated within easy distance of the University and the Royal Infirmary, contains about 130 cots, of which 50 are reserved for surgical cases and 12 for ear and throat cases It is fitted with every modern improvement and has a fully equipped out patient department for both medical and surgical cases Clinical instruction is given in the hospital by the professor of child life and health and the university lecturers in diseases of children The course which includes lectures and clinical teaching covers the care and management of the child in health as well as the medical and surgical aspects of disease in children

There are five resident officers (medical and surgical) who are appointed for a period of six months.

Royal Hospital for Mental Disorders

The 850 beds in this hospital are available for the clinical instruction of members of the university class of psychiatry and also for post graduate instruction Clinical lectures on the chief forms of mental disease and defect are given in the hospital and at the Jordanburn Nerve Hospital and the Gogarburn Certified Institution at Corstorphine A mental out patient clinic is also conducted at the Royal Infirmary and students have the opportunity of coming into personal contact with and examining cases During the past year a child-guidance clinic has been instituted There are resident physicianships and unqualified clinical clerkships in the hospital and a well equipped laboratory under a bacteriologist is available for the prosecution of clinical research by those holding these appointments

Edinburgh City Hospital

This is a large isolation hospital of modern construction, opened in 1903 Approximately 600 beds are normally available for all forms of acute infectious disease, and 200 for cases of surgical and advanced pulmonary tuberculosis The hospital has a close association with the University and the extra-mural school for the purposes of both undergraduate and post-graduate instruction, the medical superintendent being University lecturer in infectious diseases Clinics are also held from time to time in the tuberculosis wards by the University and extra-mural teachers Complete equipment exists for the investigation and treatment of all forms of infectious disease Three undergraduate courses and one post graduate course for D.P H candidates are given every year, whilst special post-graduate courses are arranged in conjunction with the Post-Graduate Association In the various courses clinical instruction is largely carried out at the bedside and special attention is directed to methods of individual immunisation and prophylaxis, and to the correlation of bacteriological and immunological findings with clinical and other manifestations of infectious disease Students attend the course in their fourth year after having passed the third professional, and attended courses in clinical medicine and surgery Three six-monthly resident appointments on an H P basis are available every half year on the fever side, and two similar posts in the tuberculosis wards

Royal Maternity Hospital

The hospital is situated close to the Royal Infirmary and the University medical school Here midwifery is studied clinically, instruction being given by the professor of midwifery and the other physicians and assistant physicians who are university lecturers on clinical obstetrics In addition to clinics and demonstrations members of the class are expected to follow all the work of the hospital, including the antenatal department Before he can qualify for a certificate in the subject each student must reside for a period of at least eight weeks in a University Hostel close to the hospital so that he can obtain full advantage of practical instruction on abnormal cases

UNIVERSITY OF GLASGOW

The medical school first began to represent an important part of the University work during the second half of the 18th century Towards the end of that period there were 200 students in the school and clinical teaching received a considerable impetus by the opening of the Royal Infirmary, not far from the old College, in 1794 For many years that institution, dealing with sufferers from the most varied ailments, including the infectious fevers was an invaluable training ground for hundreds of students After the transfer of the University to its present site in 1870 the greater part of the ordinary clinical instruction of University students was carried on at the Western Infirmary, newly erected in the vicinity, while special hospitals came more and more into existence, and so

available for special forms of instruction. Since 1911 the resources of the Royal Infirmary have been again increasingly drawn upon in view of the increased numbers requiring clinical training.

The teaching of the preliminary sciences has long received special attention in Glasgow. The Pathological Institute at the Western Infirmary, directed by the professor of pathology, was one of the first of its kind in this country. Since the beginning of the present century the facilities for scientific teaching have been greatly extended by the provision of large departments for botany, zoology, natural philosophy, anatomy, physiology, public health and materia medica An Institute of Medicine has recently been founded, equipped with laboratory

facilities, which will cater not only for elementary instruction but also for higher studies and research A new Institute of Chemistry will be opened this year. The number of students at present in the medical school is 1316 (1116 men and 200 women), of these 295 men and 43 women are entered for the combined course of science and medicine.

Admission—Applicants for entry must have passed the preliminary examination of the Scottish Universities Entrance Board as for arts or pure science, or its equivalent, and must be in possession of the "certificate of fitness" issued by that Board. The course, which extends over six years, starts in October and applications for admission must be received before the middle of June in any year. In recent years a limit has had to be set to the numbers admitted

Bursaries—There are a large number of entrance bursaries awarded by competition annually in connexion with the University, and about 25 of these may be held by students of medicine There are also several bursaries awarded during the course on the results of the professional examinations. Several research scholarships and fellowships are available also for graduates.

Qualifying examinations—There are four Professional Examinations for the degree of M.B., Ch B. For students admitted in 1939 and onwards these will be arranged as follows—First: botany, zoology, chemistry and physics. Completed at end of first year. Second: anatomy and physiology, at end of seventh term Third: materia medica at end of third year, and pathology at end of fourth year. Fourth: Part I, medical jurisprudence and public health, at end of fifth year, Part II, medicine, surgery and midwifery, at end of sixth year. There is also a combined science and medicine course with anatomy and physiology as final subjects for the degree of B Sc

Fees and cost of living—The fees for tuition, including clinical work and examinations, amount to about £275. Hostels are available for a limited number of men students at £17 10*s* per term, and for women students at 32*s*–37*s*. 6*d* per week Lodgings in Glasgow at present cost 30*s*–35*s*. per week. About three-quarters of the students live at home.

The degrees of *Doctor of Medicine* and *Master of Surgery* are granted to candidates who have previously obtained the double bachelorship, on submitting an approved thesis and completing examinations in clinical medicine for M.D., and in surgical anatomy, operations on the dead body, and clinical surgery for Ch M. The degree of *Doctor of Philosophy* is also conferred in the faculty of medicine. Candidates must already have obtained a degree (or equivalent diploma) from an approved University or College, and must prosecute a course of special study or research for two or three years and give evidence of satisfactory progress. A thesis must be presented for approval by the Senate and the candidate may be required to undergo an oral or other examination on the subject matter of the thesis

Clinical studies are carried on at the Glasgow Royal Infirmary, Glasgow Western Infirmary, the Victoria Infirmary, and to an increasing extent in the Corporation Hospitals of the city. Facilities for the study of special branches are afforded by the Royal Hospital for Sick Children, the Royal Mental Hospital, Hawkhead Asylum, the City Fever Hospitals, the Royal Maternity Hospital, the Samaritan Hospital, the Eye Infirmary, the Ophthalmic Institution, and others, and in the tuberculosis and venereal disease clinics of the city.

Anderson College of Medicine

This medical school dates back to the year 1800. Many of the most distinguished physicians and surgeons in Glasgow have been connected with it, and it has given 18 professors to the University of Glasgow, one of whom at present holds office. About 700 students attend the various classes in the year.

Courses are given which qualify for all the licensing boards and for the Universities of Oxford, Cambridge, London, Edinburgh, and Glasgow (the latter two under certain conditions) Extensive accommodation is provided for practical anatomy, chemistry, botany, zoology, physiology, pharmacy, and operative surgery. New laboratories for biology and physiology were built last year Women students are admitted on the same terms as men, and the Carnegie Trust extends its benefactions to students of the College Candidates for the L.D S can obtain the full medical curriculum; the courses special to dentistry are conducted at the Dental Hospital, Glasgow.

Glasgow Western Infirmary

This hospital of 625 beds, which is adjacent to the university, controls also the David Elder Infirmary (50 beds) and a convalescent home (40 beds) In addition to general medical and surgical wards there are special departments of gynæcology, oto rhino-laryngology, dermatology and ophthalmology, the last being housed in a new building and specially equipped for post-graduate work. In the out-patient department there are dietetic, neurological, dental and venereal disease clinics, as well as clinics in all the subjects previously mentioned There is also a fully equipped radiological department, both diagnostic and therapeutic, a radium department, which is one of the centres for Glasgow and the West of Scotland, and a department for massage and electrotherapeutics The most recent addition is the Gardiner Institute of Medicine for teaching and research The clinical courses are given by the physicians and surgeons, each of whom conducts a separate class, and students must enter their names at the beginning of the session for the class which

they propose to attend Special instruction is given to junior students by tutors or assistants, and clinical clerks and dressers are selected from the members of the class Eighteen resident assistants are appointed every six months from those who have completed the curriculum, and post-graduate courses are also given

Glasgow Royal Infirmary

Glasgow Royal Infirmary is the oldest and largest voluntary hospital in Glasgow It is situated in the east end of the city, adjacent to St Mungo's Medical College, and contains nominally 794 beds It is a general hospital with 22 wards devoted to general surgery and 10 to medicine The special departments include wards for the treatment of burns, diseases of the ear, nose, and throat, skin diseases, diseases peculiar to women, urological diseases There are also wards for metabolic examinations and treatment by oxygen therapy The Infirmary is a national radium centre for the treatment of cases of malignant disease and such other conditions as demand radiation The orthopædic department includes a large massage department and school of massage for male students There are also vaccination, dental, dietetic, and nervous and mental diseases clinics The pathological institute comprises a large pathological block, bacteriological and biochemical departments, and a fully stocked pathological museum There is a very large out-patient department, where there are nearly half a million attendances of patients annually

The teaching staff includes four professors—of surgery, medicine, pathology, and diseases of women—who hold chairs in the University of Glasgow; nine lecturers appointed by the University, four honorary clinical lecturers in clinical medicine, five honorary clinical lecturers in clinical surgery (all appointed by the University), and numerous assistants to various departments There are also Hall Fellows specially appointed, who act as clinical tutors Full facilities are given to medical students for instruction in systematic and clinical medicine and surgery, pathology, diseases of women, laryngology, rhinology, otology, &c The ophthalmic work is carried on at the Ophthalmic Institution, containing 30 beds, under the management of the Infirmary

An auxiliary hospital with 80 beds for patients in the early stages of convalescence, and 44 beds for paying patients of moderate means, was opened at Canniesburn, about seven miles from the middle of the city, last year The large new out patient department adjoining the Infirmary, which is being built at a cost of £100,000, should be ready before the end of this year It will include a rehabilitation clinic for the treatment of fractures and other injuries Post graduate classes are also conducted at the Infirmary and the Institution, and post graduate clinical assistantships are available for a limited number of students Sixteen resident surgeons and physicians are appointed every six months, and 15 non resident surgeons and physicians are also appointed for the same period

St Mungo's College

This is the medical school of the Royal Infirmary, which is the largest general hospital in Glasgow The Infirmary is situated in Cathedral Square, Castle Street, and has car communication with every part of the city St Mungo's College, which has accommodation for over 300 students, is in the Infirmary grounds and affords full courses in all the subjects of the medical curriculum and in all the medical subjects of the dental curriculum The classes qualify for the medical and dental qualifications of the English, Scotch, and Irish Conjoint Boards, and, under certain conditions, for the various universities, including the University of London Students who have fulfilled the conditions of the Carnegie Trust are eligible for the benefits of this Trust during the whole course of their studies at St Mungo's College. Further particulars can be obtained from the secretary of the medical faculty

Victoria Infirmary

This institution, situated at Langside, and having its office at 40, St Vincent place, Glasgow, has 495 beds, and is the third of the extensive general hospitals in Glasgow to afford opportunity for clinical instruction to students In addition to a full general staff there is a clinical research laboratory with pathologists and bacteriologists attached, radiological instructor, and a full staff of specialists. The Bellahouston Dispensary, also with a clinical staff, is conducted in connexion with the Victoria Infirmary The paying patient's wing has accommodation for 80 patients

Royal Hospital for Sick Children, Glasgow

This institution consists of (1) a hospital at Yorkhill containing 300 cots, built on an elevated and central site close to the University, (2) an out-patient department in West Graham street, and (3) a branch at Drumchapel, containing 80 cots There are one professorship and four lectureships in the University of Glasgow in connexion with the hospital, one professorship and one lectureship on the medical diseases of infancy and childhood one lectureship on surgery and orthopædics in relation to infancy and childhood, one lectureship on bio chemistry in relation to infancy and childhood, and one research lectureship on the pathology of the diseases of infancy and childhood The lectures are both systematic and clinical, but particularly and chiefly the latter In addition, special facilities are given for post graduate study Resident house physicians and surgeons are appointed every six months, in April and October

Royal Maternity and Women's Hospital

The average number of patients in the hospital at Rottenrow is 169 and over 4000 mothers per annum are attended in their own homes. The work of the antenatal wards with their 50 beds is supplemented by large antenatal clinics where over 5000 new patients are seen in the course of the year. Well equipped research laboratories were opened in 1926. A full-time director of research has been appointed A pediatrician gives daily attendance and the practice of the hospital affords a good field for post graduate study There are 9 resident appointments

Royal Samaritan Hospital for Women

The hospital has 190 beds, of which 30 are for paying patients, and offers excellent facilities for clinical instruction in the diseases peculiar to women A radiological department with the most modern apparatus for treatment has been opened Lectures and clinical demonstrations are given by members of the surgical staff There is a complete course each University term for University students and one course in the summer term for College students A post graduate course is held during the summer months and a series of demonstrations for general practitioners is carried out in the winter

Glasgow Lock Hospital

The hospital at 41, Rottenrow, Glasgow, founded in 1807, contains 84 beds and 16 cots for the treatment of females suffering from venereal diseases. There is also a labour ward, and a well-equipped dispensary for out-patient attendances. There is a bacteriological laboratory, equipped with modern appliances, where continuous research work is done. Large University classes are held on the subject of female venereal disease Post-graduate classes are also held. Recently the hospital has been completely renovated and modernised. For 15 years with 614 births in the hospital there has not been a single case of ophthalmia neonatorum and practically no cases of puerperal pyrexia.

Propaganda work in the form of lectures by one of the staff to members of the public has been carried on for some years These deal with the nature, prevention and cure of the disease, and have been found of great benefit.

During the year treatment with M. & B 693 has been found of great effect, and it is hoped to reduce the period of infectiveness of gonorrhœa by such therapy.

Glasgow Eye Infirmary

The number of beds in the Infirmary has now been increased to 120 and its patients come from the whole of Scotland. One chief and two assistant resident surgeons are appointed regularly to the staff. The new outdoor dispensary, which was opened in October, has excellent facilities for instruction Student classes and post-graduate courses are held at the Infirmary The total attendances for the year 1938 at the dispensaries in Glasgow were 87,647.

Glasgow Ear, Nose and Throat Hospital

The hospital contains 84 beds and cots. At out-patient and indoor departments at 306, St Vincent-street, clinical instruction is given A research department has been installed and post-graduate courses are held during the year Recognised by the University as a teaching school in diseases of the throat, nose, and ear.

A new extension containing 20 beds is now built with a lecture hall and special rooms for endoscopy.

Any further particulars may be obtained from the senior surgeon, 306, St. Vincent-street, Glasgow, C 3

UNIVERSITY OF ST. ANDREWS

St. Andrews, though the oldest Scottish University, was the last to institute a full curriculum in medicine She had one or two medical professorships and at one time conferred a degree of doctor of medicine after examination, but the present medical school really dates from 1897, since when it has grown steadily until now more students apply for admission than the clinical facilities can cope with. Accordingly the number of students allowed to enter the first year course is restricted to about 55, and only those willing to take the full curriculum are selected. Both women and men are admitted. The training may be taken wholly in Dundee or the first two years may be spent in St. Andrews All must spend the last three (clinical) years in Dundee. In both cities full professorial staffs are available and the laboratories and teaching facilities are equally good.

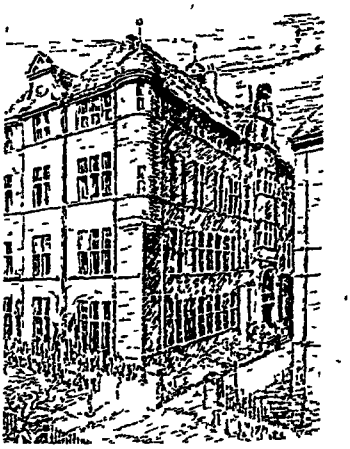
The entrance requirement is the possession of the certificate of fitness of the Scottish Universities entrance board. There is no pre-registration examination in physics and chemistry.

Scholarships —Valuable bursaries of £40–£50 a year for 3–4 years are available both in Dundee and St Andrews In St. Andrews there are also residential scholarships of £100 a year which meet the cost of hostel accommodation and pocket-money. These are not restricted to medical students but are open to all sitting the entrance bursary competitions There are a few bursaries of £40 a year for 4 years, restricted to medical students (2 for male and 4–6 for female students).

Fees and cost of living —Though classes may be paid for individually, advantage is usually taken of the arrangement whereby a composite fee is spread equally over the five years The annual payment, including clinical classes, is £36 8*s* There is also an annual matriculation fee of £2 12*s*. 6*d*, and a small charge to cover the cost of laboratory material, &c. The hospital fee is £4 4*s*. a year for the last three years.

St. Andrews is well supplied with hostels for both male and female students The charge for the 30 teaching weeks of the year is £63 for men and £65 for women, exclusive of personal laundry. Board-residence in rooms is very good in St. Andrews and averages 30*s* a week for men and 28*s* a week for women. In Dundee there is good but smaller hostel accommodation, but lodgings are not so good A certain number of clinical clerkships in hospitals and asylums offer free board and lodging to senior students. Local students, comprising about a third of the total, live at home and travel up daily.

There are four examinations for the degree of M.B., Ch.B. The first, in botany, zoology, chemistry, and physics, can be taken during the first year; the second, in anatomy and physiology, at the end of the second year. Until he has passed the second examination a student cannot proceed with clinical work. The third examination is divided into two parts The first part, taken at the end of the third year, comprises materia medica, pathology, and bacteriology. The second part, in public health and forensic medicine, is taken at the end of the fourth year. Up to this stage each subject may be entered for and taken singly, but in the fourth or final examination the candidate must enter for all three subjects (medicine, surgery, and midwifery) together. He may, however, pass in either one or two subjects if he obtains high marks, but he must complete the entire examination within 19 months



The main clinical teaching hospital is the Dundee Royal Infirmary, which covers most of the clinical work. There is also teaching at various recognised municipal hospitals and institutions Owing to the comparatively small number of students admitted each year, an unusually large proportion of graduates are able to obtain resident hospital posts

The degrees of *Doctor of Medicine* and *Master of Surgery* are conferred after a clinical examination and the presentation of a thesis The clinical examination may be and usually is taken separately; an arrangement which makes it very much easier for recently qualified practitioners to proceed to the doctorate or mastership

Dundee Royal Infirmary

This institution has 450 beds In addition to the ordinary medical and surgical wards, there are special departments for midwifery (in- and out door), for diseases of women, of children, of the eye, of the ear, nose, and throat, and of the skin, and for pathology, radiology, electrotherapeusis, and electrocardiography The radiological department has recently been reconstructed and developed Clinical teaching is given to students by the honorary staff, post mortem examinations are conducted by the pathologist All courses of instruction are recognised by the University of St Andrews and the other universities and boards of the United Kingdom Eleven resident medical officers are appointed every six months Clinical clerks and dressers are attached to the physicians and surgeons Post graduate classes dealing with general medicine and surgery, midwifery, and other special branches are held in June

SURGEON'S HALL

The School of Medicine of the Royal Colleges, Edinburgh, owes its origin to the foundation of the Incorporation of Barber Surgeons by the town council in 1505 Regular teachers of anatomy were appointed by the Incorporation in 1697, thirty years before the foundation of the medical faculty of Edinburgh University During the eighteenth century the medical schools of the university and the extramural school grew side by side, many of the lecturers being common to both, but it was not until after some lengthy litigation in the 1850's that the classes of the extramural school were recognised as qualifying for the university degree

The lecturers, who now number forty, are licensed by the Royal Colleges after a special examination The school holds no professional examinations of its own but prepares students for the degrees of Edinburgh, London, and other universities or more usually for the qualifying examinations of the Scottish, English, or Irish Conjoint Boards Students reading for an Edinburgh degree must attend half their qualifying classes in the university The number of students averages over 700 The clinical work is done mainly in the Royal Infirmary, the other classes being held in Surgeons Hall, New School, and other buildings Board and lodgings can be had near the school for from £2 to £3 a week The minimum cost of the course for the Scottish Conjoint qualification, including tuition and examination fees, is £200

Further details, with particulars of the prizes and bursaries offered, may be had from the dean at Surgeons Hall, Nicolson street, Edinburgh

MEDICAL SCHOOLS OF IRELAND

UNIVERSITY OF DUBLIN

TRINITY COLLEGE

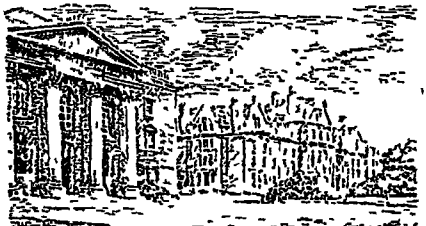
Trinity College was founded by Queen Elizabeth in 1591 as "mater Universitatis" and is still the single College of the University of Dublin Medical degrees were granted almost from its foundation, but medical training did not begin until 1654, when the College of Physicians was established Teaching in medical subjects in Trinity College was begun in 1711, from which date it has been continued without interruption The "School of Physic in Ireland," although situated in Trinity College, was a conjoint school of Trinity College and the College of Physicians from 1749 until 1800 A number of the professors in it were appointed and the examinations for medical degrees were conducted by the latter College Since 1800 the School of Physic in Ireland has been entirely under the control of Trinity College, although the Royal College of Physicians still appoints four of its professors

The buildings of the medical school are all modern and its laboratories are well equipped for teaching and research The number of undergraduate students is 510 and of post graduate students 14

Before admission students must pass an entrance examination in English mathematics, history, geography, Latin, and either French German, Greek, Irish, Italian, or Spanish The matriculation examination of a recognised university or a school leaving certificate will be accepted in lieu of the above, if passed in the required subjects On obtaining credit for entrance, the student will be admitted to the courses of the premedical year which will be devoted to physics, chemistry, botany, zoology and the first year of the arts course All medical students are required to take an arts course and the degree of B A before the medical degrees can be conferred upon them The following arts examinations must be passed the junior freshman examination, the senior freshman examination, and the B A degree examination

On passing the pre registration examination (physics and chemistry) and the junior freshman examination, the student will be registered as a medical student and may proceed with the five years' medical course beginning in October

For the degrees of M B , B Ch , B A O the following examinations must be passed preliminary scientific



medical examination (botany and zoology) either during the premedical or first medical year, first medical examination (anatomy, physiology, bio chemistry and histology) at the end of the second term of the second medical year, second medical examination (pathology and bacteriology, materia medica, therapeutics and pharmacy) at the end of the third medical year, final medical examination in (a) midwifery, (b) medicine, medical jurisprudence, and hygiene, and (c) surgery, at the end of the fifth medical year The three parts of the final examination must be passed within a period of 10 months

Entrance scholarships—The following are awarded annually on the results of examinations in subjects of general education: Scholarship of £50 per annum for four

Dr. Robert Fellx Library

and is in addition an official treatment centre for venereal diseases. The practice of the hospital is open to all students and classes are held every morning from the beginning of October to the end of June Facilities for post-graduate study are also provided.

A resident surgeon, resident physician, and resident casualty officer are appointed. These are salaried posts and are held for six months, the holder of one resident post being permitted to apply at the end of his six months' service for another. From six to nine resident students are appointed every three months. There are facilities for women students.

Adelaide Hospital

This year the hospital celebrates its centenary. It is the only clinical hospital which does not benefit from the Irish hospitals' sweepstakes. There are 163 beds, and last year 2050 in-patients were admitted and 42,797 cases were treated in the out-patients' department There are special X ray, electrocardiographic, biochemical, dermatological, gynæcological, ear, nose, and throat, and tuberculosis departments and the hospital is the training ground of the Dublin School of Massage Medical and surgical instruction is given in the wards and out-patient departments daily, with special classes for junior students. Two resident surgeons are elected every six months, and six or more resident students are elected every four months The Hudson scholarship of £30 and a gold medal, as well as the Hudson prize of £10 and a silver medal, are awarded at the end of the session for proficiency in medicine, surgery, gynæcology, and pathology. In addition to this, prizes are awarded in gynæcology and dermatology, and in clinical medicine and surgery for junior students Wallace Beatty memorial bursaries are granted at the discretion of the Medical Board to students who need financial assistance.

Mater Misericordiæ Hospital

This general hospital, under the care of the Sisters of Mercy, contains 300 beds with 96 beds in the private home Clinical instruction is given by the staff Connected with the hospital are extensive dispensaries and laboratories, a fully equipped biochemical laboratory, a modern electro-massage department, an electrocardiograph room, and radiological department (diagnostic, superficial, and deep therapy) Instruction is given in pathology and bacteriology. Four house physicians, 16 house surgeons, and 36 resident pupils are elected annually, and students are appointed as dressers and clinical clerks There is a private hospital for medical and surgical cases A training school and a home for trained nurses are connected with the hospital Particulars can be obtained from any of the physicians or surgeons or the registrar, 8, Fitzwilliam-place, Dublin

Mercer's Hospital

This hospital, with 106 beds, is situated in the centre of the city of Dublin, in closest proximity to the medical schools. From its position it receives a large number of cases of emergency surgery in addition to the ordinary medical and surgical practice Extensive alterations and reconstruction have brought the wards up to date Additions have been made in the radiographic and electrocardiographic departments Classes for pupils are held on alternate mornings in the medical and surgical wards There is a large out-patient department available for the teaching of medicine, surgery, and gynæcology. Arrangements for clinical instruction are made with Cork-street Fever Hospital. A house surgeon and a house physician are appointed annually, and there is residential accommodation for six men and two women pupils. Clinical clerks and dressers are appointed from the classes.

Richmond, Whitworth, and Hardwicke Hospitals

These House of Industry hospitals, North Brunswick-street, Dublin, contain 325 beds—140 for surgical cases, 75 for medical cases, 78 for fever and other epidemic diseases, and an auxiliary wing with 32 beds, devoted mainly to throat, nose, and ear, and skin diseases. Three resident physicians and three resident surgeons are appointed each half-year. Resident clinical clerks are appointed each quarter, and it has always been the aim of the medical board to ensure that each student spends at least six months in residence The new students' residency accommodates 20 male and 8 female students. In addition, junior students are appointed as extern clinical clerks and surgical dressers Women students are eligible on the same terms as men. Ample facilities exist for post-graduate work in the various special departments, as well as in general medicine and surgery.

Royal City of Dublin Hospital

The hospital contains 160 beds and a special wing for the treatment of fevers and contagious diseases There is a large nursery where special opportunities are afforded for the study of diseases of children, both medical and surgical. There are also special wards for ophthalmic, aural, and gynæcological cases; also a department for the Erlangen treatment by deep therapy. There is a largely attended out-patient department, where students are allowed to attend accidents and dress cases under supervision Six resident pupils are appointed every three months. A house surgeon and a house physician are appointed annually.

Dr. Steevens' Hospital

This hospital, at Kingsbridge, Dublin, contains 197 beds There is accommodation for 10 resident pupils, and board is supplied by the hospital at a reasonable rate There are massage, "sun-ray" and diathermy, X ray, and pathological departments The X ray equipment has been renewed and a new tomograph installed, as well as a short-wave diathermy, electrocardiograph, and gastroscope There are also two V.D wards and a largely attended V.D treatment centre, as well as a large open air ward for tuberculous and other diseases of bone (25 beds) for females, two open-air verandahs for male surgical tubercular cases (14 beds) and children's ward (12 cots) Daily clinical instruction in medicine, surgery, and X ray is given to extern students There is also a large fracture clinic

Meath Hospital and County Dublin Infirmary

The hospital contains 156 beds, available for clinical teaching, both medical and surgical A special surgical ward has been set apart for the reception of children. Special departments are as follows: ear, nose, and throat, dental, diseases of women, skin, and genito-urinary system Clinical teaching includes classes for both senior and junior students The Joseph Smyth scholarship in medicine, value £35, is awarded annually. Two house surgeons, a resident casualty officer, and two house physicians are selected each half-year from fully qualified pupils of the hospital. The new students' quarters include accommodation for resident lady pupils.

Jervis Street Hospital

This hospital contains 146 beds Six resident medical officers are appointed each year and facility is thus given to past students of the hospital to acquire experience as house surgeons Resident students are provided with apartments, fuel, and light, free of charge Arrangements have been made by which students of the hospital can have special fever training in Cork-street Fever Hospital

St. Vincent's Hospital

This hospital was founded in 1834 and has been administered since by the Sisters of Charity Admission is free to the poor without any distinction of creed The general hospital contains 176 beds and is equipped with medical, surgical, gynæcological, pathological, radiological, and other special departments The resident staff consists of a senior resident medical officer, and four intern and two extern medical officers In the out patient department special dispensaries are open once a week for diseases of the skin and rheumatism in children, as is a general evening clinic for the convenience of working people A private home is attached and staffed by sisters and nurses who have been trained in the hospital Proposals for the reconstruction of the hospital are now under consideration Clinical lectures in medicine and surgery are held from October to June, the junior class is held from October to April

Rotunda Hospital

This is the largest combined gynæcological and maternity hospital in the British Empire It has 151 beds and over 4800 confinements are attended annually, and upwards of 1000 gynæcological patients admitted Students can take their necessary gynæcological and midwifery practical courses The work of the hospital is carried on continuously through the year, and consists of daily clinical instruction in the maternity department and examination and operations in the gynæcological department Qualified students are given facilities for studying and assisting in the management of all abnormal cases so far as is practical They also assist in rotation at gynæcological operations, and if staying more than two months are personally allowed to perform some minor ones An antenatal clinic the infant department, and dispensary are available also A special class in gynæcological examination and diagnosis is conducted by the assistants to the master In addition there is a special class in operative obstetrics The pathological laboratory has been considerably enlarged and offers convenient facilities for practice work to post-graduates and students A biochemist on the staff is carrying out the Aschheim Zondek test for pregnancy, and is prepared to help any post graduates who are keen on doing research work A new X ray plant has been installed which greatly facilitates the study of this important and to obstetrics In the infant department a pædiatrician gives instruction daily The appointments on the staff of the hospital are given to qualified past students of the hospital who have taken the L M two resident assistant masters and two resident clinical clerks are appointed from these Women students can reside in the hospital on the same terms as men Board and residence can be obtained in the hospital Tennis-courts and a squash racket court are available for students in the residents' mess The L M certificate is given to qualified practitioners on examination after six months' attendance (four months in the case of those who took their midwifery training in the hospital) Fees one month, £6 6s , months other than first, £4 4s , three months, £12 12s L M course £21

Coombe Lying-in Hospital

The Coombe Lying in Hospital and Guinness Dispensary for the treatment of diseases peculiar to women, contains 86 beds, and consists of two divisions, one of which is devoted to midwifery and the other to gynæcological cases The hospital gives to men and women students and post graduates a thorough training in obstetrics and gynæcology Lectures are delivered, practical instruction given, and gynæcological operations are performed daily There is a special afternoon dispensary held by the master and his assistants, at which practical instruction in gynæcology is given There is no extra charge for attendance at this dispensary, or at the prenatal clinic, held on three evenings a week, at which there are about 4000 attendances annually Every year about 1200 women are delivered in the hospital and about 1600 in the district A temporary annexe containing a labour ward unit and 26 beds was opened last November An infant clinic, at which over 600 infants are treated yearly, has been established, there is accommodation for intern pupils, and women students can reside in the hospital

National Maternity Hospital

This new hospital in Holles street is now in full working order It has 150 beds and comprises ante natal, puerperal, postnatal, and gynæcological departments, and an isolation unit It also deals with an extensive extern maternity department There is a *large daily attendance at the antenatal and gynæcological* dispensaries in the out-patients' department, and at the weekly infants' dispensary The hospital courses are continuous during the year and students can join at any time Clinical instruction and oral lectures are given daily, and gynæcological operations performed on three days a week The L M diploma is granted after a three months' residential post-graduate course The examination for this diploma is held quarterly Last year the total number of admissions to the hospital was 3587, of which 2964 were maternity patients and 623 gynæcological, 2568 patients were delivered in the hospital and 705 were delivered in the district, and 12,688 adults and 1886 infants attended the out-patient department New X ray and pathological departments are now completed

---

QUEEN'S UNIVERSITY OF BELFAST

The medical school may be said to date from the foundation of a medical faculty of the Royal Belfast Academical Institution in 1831, *though* the staff of the General Hospital in Frederick street had been *taking pupils* for many years before In 1845 letters patent were issued for the establishment of Queen's College as a part of the Queen's University of Ireland and of the 195 students of the new college 28 were *studying medicine* In 1879 Parliament abolished the Queen's University and set up the Royal University, an examining body rather on the lines of London University, which drew its candidates and examiners from all sources, though mainly from the three Queen's Colleges of Belfast, Cork and Galway This arrangement did not provide the solution of the Irish University problem, and finally in 1908 two new Universities were created, the Queen's University of Belfast, and the National University of Ireland, with its constituent colleges in Dublin, Cork, and

Galway. During the Royal University period the progress of the medical school was slow: in 1879 there were 230 students, in 1908 250; but by 1926 there were 356 and now there are over 650, including about 90 women.

The school covers the whole curriculum and, thanks to the generosity of numerous benefactors,

is well-equipped with lecture rooms, dissecting-rooms, laboratories, and facilities for research in all departments

Admission.—Students entering the faculty of medicine must satisfy the following conditions.—

(*a*) Before entering the faculty they must pass (1) the matriculation examination, (2) a qualifying examination in Latin, and (3) the premedical examination in chemistry and physics, or other examination recognised as equivalent.

(*b*) After entering the faculty but before registration as medical students, they must pass the University medical examinations in physics and chemistry.

(*c*) After registration as medical students, they must spend not less than five academic years pursuing a certified course of study before presenting themselves for the final examination.

(*d*) They must be 17 years of age by July 15th of the year in which they are to commence the registration course in physics and chemistry.

The course for the degrees of M.B., B.Ch., B.A.O. is: *First year*. Chemistry (inorganic and organic), experimental physics, zoology and botany. Pre-registration examination at end of second term. Summer term, elementary anatomy and physiology. *Second year*. Anatomy, physiology and biochemistry. Examination in anatomy Part I at end of third term. *Third year*. First term, anatomy and physiology. Examination at end of this term in anatomy Part II, and physiology and biochemistry. Second and third terms, materia medica and pharmacology, pathology, and bacteriology, elementary medicine and surgery. Examination at end of third term in pharmacology, pathology and bacteriology. *Fourth year*. Hygiene, medical jurisprudence and toxicology, surgery, medicine, obstetrics and gynæcology, ophthalmology and otology. Examination at end of second term in hygiene, medical jurisprudence and toxicology. Third term, clinical pathology and operative surgery. *Fifth year*. No formal lectures, clinical study only. Operative surgery instruction on the cadaver. Final examination at end of second term.

Fees and cost of living.—The total tuition fees for the five years' course are about £250. There are two hostels for students: Riddell Hall for women, with accommodation for 42 students at £15 a term, and Queen's Chambers for men, accommodating 40 students at £14 a term.

The degrees of *Doctor of Medicine*, *Master of Surgery*, and *Master of Obstetrics* (M.A.O.) are not conferred until at least 3, or, in the case of graduates of the University in arts or science, at least 2 years, after admission to the degree of M.B. The degrees may be conferred by the Senate either (*a*) after an examination, which includes written, oral, clinical, and practical examinations; or (*b*) on the submission of a thesis or other evidence of original research or study to be approved by the faculty of medicine after an oral or other examination on the subject.

Clinical instruction is given at: the Royal Victoria Hospital, the Mater Infirmorum Hospital, the Belfast Hospital for Sick Children, the Royal Maternity Infirmary and Hospital, the Ulster Hospital for Women and Children (56 beds), the Benn Ulster Eye, Ear, and Throat Hospital (30 beds), the Belfast Ophthalmic Hospital (30 beds), the City Fever Hospital (360 beds), the Union Fever Hospital (200 beds), and the Belfast District Lunatic Asylum (1350 beds).

Royal Victoria Hospital, Belfast

The hospital was opened in 1903 to replace the old Royal Hospital in Frederick-street. It cost £120,000 to erect and much more has since been spent on extensions, so that to-day it is one of the best-equipped general hospitals in Europe. It has 538 beds and admits some 7000 patients a year. Resident pupilships of two months each are allotted to 48 students every year, including women. There are 13 resident house surgeons and house physicians and a resident bacteriologist and bio-chemist.

Mater Infirmorum Hospital

The hospital began in a small way in 1883 under the care of the Sisters of Mercy, but since then it has extended in many directions and was entirely rebuilt in 1900. Now it has 270 beds and treats nearly 4000 in-patients a year. Recent additions have been a new extern, a fine nurses' home, remodelled operating-theatres, and new X ray plant. Clinical instruction is given daily in the wards by the physicians and surgeons and teaching is also carried on in the out-patient departments. In accordance with the recommendations of the General Medical Council accommodation has been provided for eight resident students, and a house physician and two house surgeons are elected every six months Three exhibitions and a gold medal are competed for annually in June

Belfast Hospital for Sick Children

Adjacent to the Royal Victoria Hospital, Royal Maternity Hospital, and Pathological Institute of the University, this hospital is most conveniently situated for medical students. Courses of lectures are given by the staff on medical and surgical diseases incidental to infancy and childhood, and the certificate granted by the Hospital in diseases of children is recognised by the various examining bodies. There are at present 86 beds and cots The extern departments are very large and provide excellent material for the student, special attention being devoted to orthopædics. Demonstrations in ophthalmology and pathology are given, and there is a dental department A speech-therapy clinic has lately been started. There is a gold medal competition for final year students The Davis scholarship is awarded for the best thesis on some phase of children's diseases, graduates of not more than four years' standing being eligible to compete. There are three resident house surgeons.

Belfast Infirmary and Hospital

The old poor-law hospital was founded in 1840, since when it has steadily been added to and improved. It now has 1900 beds, with special departments for different categories of patients: the Abercorn Hos-

pital for cancer and observation cases, the Windsor Hospital for imbeciles and epileptics, the Dufferin and Ava Hospital for children and mothers with infants, the Jubilee Hospital for antenatal, maternity, and gynæcological patients, and separate accommodation for chronic and infirm patients There are wards for tuberculous patients, although when possible these are transferred to the Municipal Sanatorium The Fever Hospital accommodates non notifiable infectious cases and others during epidemics A limited number of resident medical students are admitted There are 10 visiting medical officers and 8 resident medical officers and arrangements to appoint a resident medical superintendent for the hospital department are under consideration

Royal Maternity Hospital

This building is in the grounds of the Royal Victoria Hospital There are 100 beds and an antenatal department catering for a large district There is also an infant clinic and a separate isolation block for the treatment of puerperal sepsis The university obstetric tutor resides in the hospital and acts as senior resident medical officer He is assisted by three house surgeons, and resident accommodation is provided for 15 students or post-graduates

SCHOOLS OF SURGERY

The Schools of Surgery are attached by Charter to the Royal College of Surgeons and have existed as a department of the College for over a century They are carried on within the College buildings in St Stephen's Green, and are subject to the supervision and control of the Council The schools are in the centre of Dublin, conveniently near many of the hospitals The buildings have been reconstructed, the capacity of the dissecting room nearly trebled, and pathological and bacteriological laboratories refitted. There are excellent playing fields in the suburbs of Dublin, and flourishing football and athletic clubs and medical and literary societies The students, who now number between 400 and 500, live in lodgings or at home

Scholarships and prizes Carmichael scholarship, £15, Mayne scholarship, £8, Stoney memorial gold medal, operative surgery gold and silver medals, Barker prize, £26 5s, H Macnaughton-Jones gold medal in obstetrics and gynæcology, and class prizes and medals

Prospectus can be obtained from the registrar, Royal College of Surgeons, Stephen's Green West, Dublin

EXAMINING BOARDS

ENGLISH CONJOINT BOARD

ROYAL COLLEGE OF PHYSICIANS OF LONDON
ROYAL COLLEGE OF SURGEONS OF ENGLAND
M.R.C.S., L.R.C.P.

ALL the schools described under the heading of the Universities to which they are attached are *recognised as suitable places of instruction* by the corporations granting medical diplomas, and special studies can also be pursued at certain metropolitan and other hospitals mentioned below The courses of study at the principal colonial medical schools are also recognised as qualifying for the examinations of these corporations

Students of the Royal Colleges must pass a preliminary examination in general education recognised by the Board, and a *premedical examination* in chemistry, physics, and elementary biology conducted by the Board before commencing the five years' curriculum of professional study They may be exempted from the premedical examination if they have passed the examination in chemistry, physics, and biology for the degree in medicine of any university recognised by the Board, the higher school certificates of Oxford and Cambridge Universities and the Oxford and Cambridge Schools Examination Board, the higher certificates of London, Bristol, Durham Universities, the Joint Matriculation Board of the Northern Universities, or the Central Welsh Board higher certificate

There are two professional examinations called the first and final examinations The subjects of the *first professional examination* are Part I (*a*) anatomy, including histology and embryology, (*b*) physiology, including biochemistry Part II Pharmacology and materia medica A candidate must have attended at a recognised medical school courses of instruction in anatomy (including embryology), physiology (including biochemistry), pharmacology and materia medica A candidate may present himself for the two parts together or separately, but he must take sections (*a*) and (*b*) of part I together until he has passed in one or both, but a candidate will not be allowed to pass in one section unless he obtains at the same time at least half the number of marks required to pass in the other section

Part II of the examination may be passed at any time before the candidate enters for the final examination, provided that the courses for part I have been completed A candidate who passed an examination in the subjects of part I or of either section of part I and of part II in the examination for the degree in medicine conducted at a university recognised by the Board will be exempted from further examination in such subjects

The subjects of the *final professional examination* are Part I, pathology (including morbid anatomy, morbid histology, and clinical pathology) and bacteriology Part II, medicine, including medical anatomy, forensic medicine, and public health Part III, surgery, including surgical anatomy and the use of surgical appliances Part IV, midwifery and gynæcology The examination is partly written, partly practical, partly clinical, and partly oral A candidate may take the four parts separately or the whole examination together, but part IV must not be taken until the other three parts have been passed, unless it is taken concurrently with the remaining part or parts which have not been previously passed

Members of recognised universities outside the British possessions are admissible to the examinations under special conditions Graduates in medicine and surgery are required to pass the first examination and to complete 36 months' hospital practice before admission to any part of the final examination Undergraduates are required to complete the full curriculum, after passing the premedical examination

Members of certain recognised Indian Colonial, and foreign universities who have passed examinations for the degree of Doctor or Bachelor of Medicine or Surgery in the subjects of the first examination may present themselves for the final examination under special conditions

The following provincial general hospitals are recognised for reference study in medicine and surgery for the final examination: Royal United Hospital, Bath, Bedford County Hospital; Bradford Royal Infirmary; Royal Sussex County Hospital, Kent and Canterbury Hospital; Coventry and Warwickshire Hospital, Derbyshire Royal Infirmary, Royal Devon and Exeter Hospital; Gloucestershire Royal Infirmary; Royal Surrey County Hospital, Halifax Royal Infirmary, East Suffolk and Ipswich Hospital, Leicester Royal Infirmary, Ancoats Hospital, Manchester, Northampton General Hospital, Norfolk and Norwich Hospital; Nottingham General Hospital; South Devon and East Cornwall Hospital, Royal Portsmouth Hospital, Preston Royal Infirmary, Royal Berkshire Hospital, Salford Royal Hospital, Royal South Hants Hospital; Staffordshire General Infirmary, Swansea General Hospital, Royal Hants County Hospital, Worcester Royal Infirmary, York County Hospital

Further particulars from the secretary, Examination Hall, Queen-square, London, W.C 1.

SOCIETY OF APOTHECARIES

L M S.S A. LOND.

The premedical and primary examinations are held quarterly. The *Premedical* includes chemistry, physics, and elementary biology. The *Primary* includes anatomy, physiology and histology, materia medica, pharmacy, and pharmacology. The latter examination cannot be passed before the completion of five terms' physiology and practical anatomy with demonstrations, and the first two subjects cannot be taken separately except in the event of the candidate having previously passed in one, and obtained at least half the marks required to pass in the other.

The *Final Examination* for the licence (L M S S A. Lond) is held monthly, except in September, and is divided into the following sections Section S. Principles and practice of surgery, including surgical pathology, surgical anatomy, operative manipulation, instruments and appliances Section M Principles and practice of medicine, including therapeutics, pharmacology, medical and general pathology, bacteriology, morbid histology, forensic medicine, hygiene, mental diseases, and the theory and practice of vaccination Section O Midwifery, gynæcology, diseases of new-born children, and the use of obstetric instruments The examination is partly written, partly practical, partly clinical, and partly oral Sections S, M. and O may be taken at separate examinations, but midwifery must be taken last unless it is taken concurrently with part or parts which have not previously been passed There is no exemption from any part of the final examination

The minimum period of medical study extends over five years (57 months) and three academic years (33 months) must elapse after a candidate has passed the examination in anatomy and physiology before he can complete the final examination. The course of study for the final examination includes attendance on the surgical and medical practice with post-mortem examinations at a hospital connected with a medical school for a period of three winter and three summer sessions, including a course of practical midwifery, with attendance on 20 midwifery cases The offices of dresser and clinical clerk must have been filled at a hospital or institution recognised by the Society The certificates prescribed by the regulations must be produced before admission to the respective sections of the final examination.

Further information can be obtained from the registrar, Apothecaries Hall, Water-lane, E C.

SCOTTISH CONJOINT BOARD

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH
ROYAL COLLEGE OF SURGEONS OF EDINBURGH
ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

L.R.C.P. & S. E., L.R F.P.S. G.

THE Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, and the Royal Faculty of Physicians and Surgeons of Glasgow have made arrangements by which, after one series of examinations, held in Edinburgh or Glasgow, or both, the student may obtain the diplomas of the three bodies. This is the Scottish Conjoint Board The three bodies grant their Single Licences to candidates who already possess legal qualifications in medicine or surgery.

The hospitals which are recognised by the Scottish Conjoint Board as places where professional study for their diplomas can be pursued are all those institutions which feed the medical faculties of the universities, and those which are recognised by the English and Irish Conjoint Boards.

Students desirous of obtaining the Diploma of the Scottish Corporations are required before commencing their professional studies proper to pass preliminary examinations (*a*) in general education, and (*b*) in elementary chemistry and elementary physics, and in the fundamental principles of biology They must then enter their names on the Register of Medical Students kept by the General Medical Council Subsequent to registration they must engage in professional study over a period of not less than five academic years, and pass the prescribed professional examinations

Preliminary examination in general education—This examination may be passed before any of the Boards recognised by the General Medical Council. The Educational Institute of Scotland conducts a Qualifying Preliminary Examination for medical students in Edinburgh and Glasgow Copies of the Regulations may be had on application to the Educational Institute of Scotland, 46 and 47 Moray-place, Edinburgh The candidate must pass in the following subjects (*a*) English (*b*) Elementary mathematics. (*c*) A language other than English (*d*) An additional subject to be chosen from history, geography, logic, English literature, Latin, Greek, Hebrew, French, German, or other language accepted by the university or licensing body for the purpose Exemption may be granted to students who hold a university degree, the preliminary examination for which included all the subjects required by this Board, or who present the "Certificate of Fitness" granted by the Scottish Universities Entrance Board, or an equivalent certificate recognised by the Triple Qualification Board

Preliminary examination in natural sciences—The Board conducts preliminary examinations in the subjects of chemistry, physics, and biology. The examinations are written, practical, and oral, and are held quarterly in Edinburgh or Glasgow Candidates must present themselves for chemistry and physics together, unless they have obtained exemption from one of them Exemption from one or more of the subjects of this examination may be granted to students who have passed an equivalent examination recognised by a University or licensing body for admission to a medical course

Professional curriculum—The period of professional study, between the date of registration as a medical student and the date of the final examination for any diploma which entitles its holder to be registered under the Medical Acts, shall be a period of certified study during not less than five academic years The subjects of study included in the medical curriculum are · (1) The professional scientific subjects: anatomy,

physiology, pharmacology and materia medica, and pathology and bacteriology (2) The clinical subjects medicine, surgery, midwifery and gynæcology, and various special subjects (3) Medicine in relation to the community public health and forensic medicine The first two years shall be devoted to the study of anatomy and physiology with an introduction to clinical methods The last three years shall be devoted to the study of clinical subjects, together with the clinical application of the professional scientific subjects Students shall not pass to the period of clinical studies until they have satisfied the examiners on the subjects of the first and second year

Professional examinations.—Candidates are required to pass three professional examinations, called the first, second and final examinations These are partly written, partly practical and oral, and are held four times in a year A candidate may be exempted from the first or second examination, on the production of a certificate that he has passed an equivalent examination for a medical qualification before one of the recognised Boards

The *first examination* consists of the following subjects (1) Anatomy and embryology, and (2) physiology, including histology, bio chemistry, and bio physics The subjects of this examination must be passed at the same time

The *second examination* consists of the following subjects: (1) pathology, including bacteriology and morbid anatomy, and (2) materia medica and pharmacology (theoretical and practical), including pharmacological chemistry, the principles of therapeutics, and prescription writing Candidates may take Parts (I) and (II) separately, or they may present themselves for both parts at one time

The *Final examination* consists of two parts: I (*a*) forensic medicine and (*b*) public health II (*a*) medicine, including therapeutics, applied anatomy, and physiology, and clinical pathology with clinical medicine, (*b*) surgery, including applied anatomy and physiology, clinical pathology, with clinical surgery, and (*c*) midwifery and diseases of women, clinical obstetrics and gynæcology, with practical midwifery

All candidates for the Triple Qualification must appear for the final examination A candidate must enter for forensic medicine and public health together, unless he has already passed in one of these subjects, and he must enter for medicine, surgery, and midwifery together, unless he has already passed in one or more of these subjects

Part II may be taken at any time after the completion of five winter and five summer sessions of study, provided that a period of thirty three months has elapsed since passing the first professional examination

The registrar in Edinburgh may be addressed at 18, Nicolson street and the registrar in Glasgow at 242 St Vincent street, to whom fees and certificates must be sent for the respective examinations, and from whom particulars of fees can be obtained

SINGLE LICENCES

The Royal College of Physicians of Edinburgh grants its single licence after examination to candidates whose names already appear on the Medical Register

The Royal College of Surgeons of Edinburgh admits to the examination for its single licence candidates of either sex who hold a diploma in medicine of any British, Indian or foreign university or of any British College of Physicians, or of the Society of Apothecaries of London or Apothecaries' Hall, Dublin whose preliminary examination and course of professional study is proved to be sufficient to fulfil the requirements of the College, or those who have passed a full examination for any of the above.

IRISH CONJOINT BOARD

ROYAL COLLEGE OF PHYSICIANS OF IRELAND
ROYAL COLLEGE OF SURGEONS IN IRELAND

L.R.C.P.I. & L.M., L.R.C.S.I. & L.M.

The Conjoint Board of the Royal College of Physicians of Ireland and Royal College of Surgeons in Ireland requires that the candidate should pass either its own preliminary examination in the subjects of general education or proof that the candidate has passed one of the tests accepted by the General Medical Council He must also pass the pre registration examinations in chemistry and physics and biology

Professional examinations.—There are three professional examinations, the first of which cannot be completed earlier than the end of the second winter session, nor the final before the conclusion of five years of medical study Before being admitted to any of them the candidate must show that he has studied the different subjects in practice and theory for the requisite periods, certificates to this effect being accepted from the authorities of most of the recognised medical schools at home and abroad

The *first examination* consists of applied chemistry, anatomy, and physiology The *second examination* deals with (*a*) pathology, (*b*) materia medica, pharmacy, and therapeutics, (*c*) ophthalmology and aural surgery, and may be taken separately The *final examination* is divided into three divisions, which cannot be completed until at least five years have passed in medical studies other than those for the pre registration examinations, and five years at least since the beginning of the curriculum The divisions are (*a*) medicine (including fevers, mental diseases and diseases of children), forensic medicine, hygiene, and public health, (*b*) surgery, including operative surgery, (*c*) midwifery, including diseases of women and children, and the practice of vaccination

SINGLE LICENCES.—The Royal College of Physicians of Ireland issues its licences in medicine and in midwifery to medical men whose names appear on the Registers of the General Medical Council or of Eire

Licence in Medicine.—The subjects of examination are practice of medicine, clinical medicine, pathology, medical jurisprudence, midwifery, hygiene, therapeutics

Licence in Midwifery.—Candidates must produce certificates of registration A registered medical practitioner of five years' standing may be exempted from the written examination

The Royal College of Surgeons in Ireland issues its licence in surgery to practitioners whose names are entered either on the Medical Register for the United Kingdom, the Colonial Medical Register, or the Foreign Medical Register of the year in which he presents himself for examination, and who satisfies the council that he has passed through a course of study and examinations equivalent to those required by the regulations of the Irish Conjoint Board

Candidates are examined in general surgery (paper and oral) clinical surgery surgical pathology (oral), operative surgery, surgical anatomy (paper), and ophthalmic and aural surgery (clinical)

APOTHECARIES' HALL OF IRELAND

LICENTIATE.

The licence of this Hall is granted to students who present certificates of having fully completed the course of study as laid down in the curriculum and who pass the necessary examinations The diploma of the Hall entitles the holder to be registered as a

practitioner in medicine, surgery, and midwifery, with also the privileges of the Apothecary's licence.

Candidates must pass three professional examinations, called the first and second professional examinations and the final examination, which are conducted at separate times, partly in writing and partly practically and orally. The examinations are held thrice a year, in March, June, and November, or such other dates as may be determined

Candidates who produce satisfactory evidence of having passed an examination for a degree or licence in medicine conducted by any university or Royal College in the British Empire, or by any Foreign university whose degrees are recognised in the foreign list of the Medical Register, will be exempted from the primary examination.

The subjects for the *first professional examination* are: anatomy, physiology, and histology, including biochemistry; and for the *second professional*, materia medica and pharmacy, pathology, and medical jurisprudence and hygiene

For the *final examination* the subjects are: (*a*) medicine and clinical medicine and clinical methods; (*b*) surgery (clinical, ophthalmic, and operative) and surgical anatomy; (*c*) midwifery and gynæcology, and practical pharmacy and materia medica (if not taken at intermediate examination)

Each candidate before receiving his diploma must produce evidence that he has attained the age of 21. The details of the course of education required and syllabus of the examinations will be supplied by the registrar at 95, Merrion-square, Dublin.

We take this opportunity of thanking the officials of Government Departments and the deans and secretaries of the various institutions for their coöperation in enabling us to bring the information contained in our Students Number up to date. The line drawings of universities and medical schools (with the exception of Oxford) were made by Mrs M. A. Clayton-Jones from photographs and prints kindly supplied by local officers.

GRAINS AND SCRUPLES

Under this heading appear week by week the unfettered thoughts of doctors in various occupations. Each contributor is responsible for the section for a month; his name can be seen later in the half-yearly index

FROM DOCTOR DON

IV

I REMEMBER drinking beer with some fellow students in a South Lancashire public-house when one of our number was asked his profession. In fun he answered "A puddler." But the questioner, who was himself an iron-worker, cried out, "You're not a puddler, you're a bleeding clurk" The iron-worker's observations are the germ of an important new science, the science of occupational selection. You can tell just from the sight of the back of a man's neck that he is more likely to enjoy reading the *Pink 'Un* than the *Ode on the Intimations of Immortality*, and the Americans have found that six hours with an instructor in an aeroplane are sufficient to decide with reasonable accuracy whether a man is likely to make a good pilot But how shall we decide whether the man is to fly bombers or fighters? Or which of a group of women going in for teaching is likely to break down in 10–15 years with exophthalmic goitre? How shall we get sufficient skilled craftsmen out of our dull Saxon race to enable industries such as the manufacture of glass, optical instruments, and scientific apparatus to compete a little better against the Germans and Americans? Shall we preselect our doctors-to-be and, if so, how? I felt that an enormous opportunity was missed in not instituting experiments on occupational selection with the new militia, now that mechanised warfare demands so many different specialised abilities; but we doctors can hardly expect to persuade others to follow a course which we are not following ourselves

My own decision to enter medicine was taken late. At school I had specialised in languages with a view to the university and the civil service, but after 2½ years in the Army I was certain I could not live on my intellect alone, without use of my hands and without close contact with people And so I turned to medicine and have never wanted to turn back. It may be different in surgery and obstetrics, but such poetry as medicine brings is in the elegiac vein *sunt lacrimæ rerum*. I remember an old tabetic telling me how he would sometimes awake in the morning, and it was dark, and he would think the sun had not risen. And then he would remember he was blind, and for him the sun would never rise again Or the man whose wife had just died of acute leukæmia, saying "Seven years' perfect happiness Well, I suppose I've had my share for one lifetime" For all this, there can be no life with greater opportunities for delight in work than medicine, and such of us as have felt this delight would not willingly deny it to others. But when we come to study the entry into medicine, we find that the amount of self-selection is extremely small According to Sir Alan Newton's questionnaire, for only 10 per cent had it been an ambition since childhood, whilst for over 50 per cent. it seems to have been a matter of complete indifference

It is high time, then, that some suitable body, such as the Royal Colleges, should organise an experiment on the value of methods of occupational selection in sifting the entry into medicine. It would be necessary to devise a psychological interview, and tests of physical aptitudes and of certain qualities of memory and intelligence A sufficient number of students would be submitted to the tests, and the findings would be correlated, say 7 and 15 years later, with teachers' reports, examination results and progress after qualification. And here, in passing, may I say how much organised medicine in this country owes to men who have been "good pickers" I think especially of Sir Robert Muir, who trained so many pathologists, and Sir Henry Dale, who selected such a remarkable band of workers for the Medical Research Council. Young men often do not know their own special gifts, and all of us have seen the serious, over-scrupulous person, who would have made a good researcher, trying to become a gynæcologist, and the person with ideas above his intellect enter the laboratory, when he would have been better working twelve hours a day as assistant to a shrewd practitioner. For such as these a kindly teacher may

do much, though it is often hard to find the right phrase and the right season

* * *

Within a few years we shall have to have a royal commission or its equivalent to decide the numbers entering the profession and the curriculum At present the General Medical Council has no control over the universities, and the universities have little control over the colleges at Oxford and Cambridge, or the hospitals in Edinburgh, Glasgow and London The Conjoint, the Triple Qualification and similar anomalies continue to exist, though I have never heard an argument for them that was not special pleading A London girl has much greater difficulty in getting into medicine than a girl in the provinces It is impossible to increase indefinitely the capacity of the existing schools, and if the numbers entering the profession remain large, new medical schools must be created From conversations with examiners and heads of units I believe that the best medical education available today is a preclinical course at Oxford plus a clinical course at Sheffield In both places classes of reasonable size are taught by teachers above the average in ability, but unless Oxford moves rapidly it will share the fate of Edinburgh and Cambridge and see its high reputation brought low by excessive numbers

* * *

The curriculum includes 1 year premedical, 2 years preclinical and 3 years clinical work To this must be added 6 months of military service and sooner or later a compulsory 12 months in an approved hospital or laboratory before a licence to practise is granted Assuming the student starts this course at 17½ he cannot earn his living until he is 25 From this I conclude that it is impossible to increase the length of the medical course Since I qualified in 1923 enormous advances have been made in nutrition, chemotherapy, virus pathology, endocrinology, and radiology Our students cannot work more—already even the most intelligent have to study harder than is good for them The average chemist appears to be able to reason almost immediately after graduation, but it takes about 2 years before the young doctor recovers from the strain of qualifying and begins to think intelligently about the body of doctrine which has been handed on to him What is to be the solution of all this? How are we to adapt our curriculum to the growth of knowledge?

It is impossible for a medical man to look at the curriculum without prejudice, and when I look at it through the prejudiced eyes of a clinical scientist I am struck by the fact that we teach one subject twice over—the study of physical disease We teach it as pathology and we teach it again as the be all and the end all of diagnosis If we believe sincerely that prevention is better than cure, that 75 per cent of the sickness in our Western civilisations is without any anatomical basis, and that the work of the medical profession must be orientated towards the preservation and increase of health and the multiplication of a healthy stock, then it does seem as if both pathologist and clinical teacher are devoting an inordinate amount of time to the study of organic disease One of my teachers used to spend hours demonstrating the crescendo murmur of mitral stenosis with a bit of rubber tubing whilst another used to teach rarities of auscultation such as the veiled puff of Laennec Whether clinical teachers like it or not, their students are living in the days of the aeroplane, the wireless—and the laboratory, and the proper way for them to diagnose pulmonary tuberculosis is to suspect it on symptoms and to confirm it by X-ray and sputum tests On the other hand, the correlation between symptoms, signs and post-mortem appearances is being neglected since pathology has become an examination subject, with its special teachers, its particular jargon and its frequent scorn of the clinician In Oxford and Cambridge pathology is almost completely divorced from clinical studies

I suppose about 80 per cent of our students will become general practitioners and 80 per cent of their patients will come from homes with incomes less than £5 a week At lectures to medical societies and at postgraduate courses I have often heard practitioners say, "I wish I'd been taught more about children and skins," or "I don't think young men should go into practice knowing so little about the panel system and therapeutics" Never once have I heard a man say "It has always bothered me that I never really understood fatty change in the liver", or "We men in practice would handle our pneumonias a good deal better if we'd been taught a bit more about inflammation" The foundation stones of medical science are biology, chemistry, anatomy and physiology, and it would be a disaster to weaken them, but the superstructure must be modified to meet the needs of the time

Pathology developed because the practising clinician was unable to keep pace with the growth of knowledge in morbid anatomy and bacteriology The pupils of Muir and similar pioneers became pathologists throughout the length and breadth of the land, and being capable whole time workers they acquired strong influence in the medical schools and dominated the partition of the student's time The student who had already been well grounded in the fundamental sciences now had to be grounded afresh in pathology. This method of education was well adapted to its day, but its day is coming to an end When X, whose training had not followed the orthodox lines of the post mortem room and the demonstratorship in morbid anatomy, was appointed to a chair of pathology some years ago, the doyen of British pathologists was heard to murmur, "X? X? there is no pathologist called X" To which the obvious reply is, "Pathology? pathology? there is no science called pathology" America does today what we shall be doing tomorrow In America the status of academic pathology seems to be rapidly falling, and the bright young men go into applied physiology *or experimental medicine*

Bacteriology has become an *independent* science with close affiliations with chemistry, agriculture and hygiene Morbid anatomy is as well worked-out a field as clinical nosology *Whole time clinical units* have grown up in medicine, surgery and gynæcology which already cut their own *sections* and do their own routine bacteriology and pathological chemistry Disease as a *process*, and the end results of this process, should surely be taught as part of the clinical *sciences And so I think* that after being separate these thirty years pathology and medicine will fuse together again, and undergraduate teaching by professional pathologists will be limited to simple *courses in morbid* anatomy (part of surgery) and *clinical pathology* (part of medicine) Pharmacology will likewise be broken up between physiology *and medicine* The experimental pathologists and pharmacologists will work in research institutes and *postgraduate schools* a trend already clearly visible

Whatever our faults in medicine, we are at any rate conscious of many of them and anxious to improve Experience as head of a department, with

a certain amount of money to spend, suggests to me that in business efficiency is the exception rather than the rule, and I wonder, not that our people are losing markets, but that some of them retain any customers at all One or two of our manufacturers of standard physiological and laboratory equipment were notorious for delay even before rearmament gave them an excuse for casualness It is nothing to wait six months, without excuse or apology, for an order which should be executed within a week. An inquiry for balances, with a fair prospect of £50 worth of trade, produced a salesman who knew neither his catalogue nor the first principles of weighing; a cine-projector was demonstrated by another who had not taken the pains to familiarise himself with the controls A travel agency, in response to an inquiry about a trip to America, which was accompanied by fairly precise specifications as to date and route, merely sent shipping lists of which some were out of date and the others irrelevant. Is it any wonder that I contrast this unfavourably with certain famous German manufacturers of optical and microscopic apparatus, who always answer my queries in detail, make useful suggestions and are at pains to deliver promptly?

Much of our apparatus is fantastically costly. Of course there are far too many people making and selling medical apparatus—every hospital of any size seems to have its own firm across the road, and there is a regular constellation of them within a mile of Oxford Circus Mr Ogilvie has complained of the lack of individuality in American instruments, but the lack of standardisation in British instruments is an even greater fault—think of the number of times we have been let down because needles or lights are not interchangeable. The regional grouping of hospitals and the creation of a strong central committee, with the power of the purse behind it, should be especially valuable in standardising fittings and reducing prices We must reconcile ourselves to the fact that such committees will not always accept the doctor's opinion as gospel When he wishes his beds wired for electrocardiography, they may even have the temerity to suggest that it is cheaper and just as good to buy a portable instrument But some of our number have cried "Wolf" too often, and it will do no harm for someone to say "Oh yeah!" when we try to extort something quite unnecessarily extravagant and expensive on the grounds that it is essential for the welfare of the patient

On the other hand I should be glad to speak a kind word for the drug firms who are so often maligned for filling our waste-paper baskets with rubbish. It is true that they exploit human sickness and overcharge grievously, but which of us can throw the first stone at them on that account? They are nevertheless anxious not to put out preparations which do not do something of what is claimed, as this always does them harm in the end Their agents and travellers are becoming overwhelmingly old-school and guardee, but such as visit me do know their book The supply of materials to doctors who will carry out reasonable trials and report their results is exceedingly generous And how well-informed they are about the march of discovery! Already I have received offers of parenteral vitamin K

Moreover the advertisements are a great joy I have little use for the female forms which attract our attention to X-ray apparatus, cigarettes, ultra-short-wave therapy and the latest cure for *Trichomonas vaginalis*, but I am very fond of such as Borden's cows and Postum's "folk who make life a little tougher." I have begun, in a desultory way, to make up from them a Picture Book of Constipa... which may one day form the material for a le... and other collections of the same kind might ... interesting. Indeed, they might one day becom... valuable as the scrapbooks of the eighteenth centu... The reproductive functions, oral hygiene, breakf... foods, body odour—there is no dearth of subjects

* * *

Another thing that has caught my eye in t... journals is the Testament of Nutrition and t... doctors' somewhat unwarranted trespass into agricu... ture and its technique. The *Times's* page on agricu... ture is one of the high spots of my week, where ... follow with interest the progress of the Stap... grass technique and the quarrels between the ... and the cod-liver oil producers over the supplement... to the diet of the pig. This page has naturally ... some echoes of Indore and the great compost ... troversy. The fervour of the composters from ... suggested that they were speaking from the ... rather than the head, but it is only in the last ... months that I have realised that composting ... some has become almost a religion, and I am interested to find our Cheshire doctors amongst its disciples. I have been buttonholed on this subject at cock... parties when people have discovered I had a garde... and I have learnt that there is a something-sophi... society and a First Commandment—Give back t... the Earth what ye take from the Earth. I hope th... this will come to Freud's notice, for it will make a... interesting appendix to his views on the ætiology o... tidiness and miserliness, and their connexion with... the infant's preoccupation with its excretions

* * *

But I am finding that writing Grains and Scruples is just as fascinating as running a department or sitting on committees or playing about in the laboratory or talking to patients about their ego, and it is time I finished Moreover I have neglected my opportunity this week to moralise to the students, though that might have been difficult after betraying my particular blend of evangelism and hellenism, of St Anthony and Dionysus. But let them remember that doctors, like the priests, have often been hated by the people. They stood high on the list of victims in the blood-bath in Madrid It is wrong to rationalise this in terms of primitive hatred of the father, for the fault is in ourselves It is not given to mortal men to be the arbiters of life and death or to solve the riddles of the universe, and both we and the priests become stiff-necked in the rôle we are cast to play We must constantly remind ourselves of the danger of arrogance and cherish the virtue of humility

---

Next month D P.M. will be responsible for these columns

" Especially does it seem incredible to us that the attributes of the human mind should be uniquely the property of a little organic slime on an infinitesimally small fragment of the matter in the universe Hence we postulate a greater mind, and wonder about it, as a couple of cells in the body might (were they suitably endowed) wonder whether they were part of something greater, without being able to reach a decision that was capable of demonstration I cannot bring myself to believe that the human mind is a purely ephemeral and essentially quite unimportant phenomenon in a vast inanimate universe "—Prof T D. A COCKERELL, of the University of Colorado, quoted in *Nature, Lond* Aug 19, 1939, p 304

THE LANCET

LONDON SATURDAY, AUGUST 26, 1939

DRASTIC REMEDIES

THE strenuous years of the curriculum proper are only a small part of our medical training, which starts at school and goes on through life, but it is these years that have come in for most criticism To read the medical journals one would think that they are organised very badly indeed, that is not so, but there are difficulties One is that, with the passing of the apprenticeship system, the student does not come into contact with patients until late in his career, another is that, with the advance of science, the years are increasingly overcrowded Of the first difficulty there is no efficient cure the student must work out his own salvation He cannot do it by playing golf or driving a motor-car, for these occupations take him away from the people to whom he must give his life Ninety per cent of the population come within the income-limit of the national health insurance acts These are the people he must know He must walk through the countryside and come to the hospital in a bus He may lunch off bread and cheese and beer at a country pub, or off coffee and poached eggs on the marble-topped tables of a teashop He must go regularly to the pictures and study the development of Shirley Temple and learn to recognise the "yee a ow" of Wendy Hiller when he hears it again at outpatients He should listen to the variety on the wireless, and hear the full-throated roar that greets the quip which has missed the censor Physiologists can teach him the theories of nutrition, housekeepers its practice On Friday evening he should go shopping with his landlady or her daughter, to learn the price of bacon and which are the cheaper cuts, to know the countries that send us butter and how much we have to pay for a pound from each Nor are these things all Music today is a necessity, and he must continue to read good English, and especially poetry, not only, as Lord HORDER has recently told us,[1] because the use of words is vital to the doctor but also that he may retain the flavour of a lovely language while he is studying from his textbooks

But if we ask the student to find his own solution to one of his difficulties our responsibility is the greater to solve the other Let us frankly admit that up to the present no way has been found In 1931 a start was made by London University, and a conference of examining and teaching bodies was appointed The conference began with the intention of lightening the curriculum, but in 1935 it produced a report of great ability which did nothing towards this, although it contained many valuable recommendations The time has come when some of us are *beginning to feel that* much more is required than a rearrangement of detail which will hurt nobody's feelings The ideal must be to look afresh at the objects to be attained and consider afresh the possible ways of reaching them From university and medical school incessantly comes the news that students are being over-worked and under educated Radical reform is essential, and it is a healthy sign that drastic remedies are now beginning to be proposed Last year, for example, Mr T B LAYTON, addressing the Society of Apothecaries, threw a bombshell, as we then described it,[2] when he suggested that the way to solve the difficulty is to take obstetrics out of the curriculum Recently he has returned to the subject[3] and expounded his views further They are based on the fact that of those who qualify only a bare majority now go into general practice, so that the curriculum should no longer be constructed to turn out family doctors Its aim should rather be to produce men and women who can branch out in any direction for which they have a natural bent or into which fate guides them Even in general practice not all do obstetrics Hence students are being burdened with facts that most of them will never need and cannot use in after life Obstetrics, he argues, should therefore be transferred from the curriculum to the postgraduate period His next step would be to interpolate between qualification and independent practice a "graduate" period of a year in which the newly qualified young doctor would, by law, be allowed to practise only under the guidance and supervision of a senior There is nothing new in this last idea except the name, *its germ is included* in the report of the curriculum conference

The views put forward this week in Grains and Scruples by Doctor Don differ from those of Mr Layton only as do the academic from the economic Doctor Don suggests that the time is at hand when the student will be unable to earn his living before the age of 25 Mr Layton proclaims that, whatever is done, there must be no further inroads on fathers' pockets Doctor Don would disestablish pathology and fuse it to medicine, and would split up pharmacology between physiology and medicine Mr Layton would translate obstetrics to a higher plane But if the curriculum is lightened in these or other ways we must be careful that it is not swamped by a number of other subjects simply because enormous advances are being made in them The new knowledge must be absorbed into the existing divisions of the student's time, which must each drop something to make room for it On this point Doctor Don writes wise words that should be taken to heart by clinicians and pathologists His suggestions and those of Mr Layton are drastic but they are both practical and practicable Medical educationists will give them the consideration they deserve, for, to quote Doctor Don, "Whatever our faults in medicine, we are at any rate conscious of many of them and anxious to improve"

CHOICE OF A CAREER

THE newly qualified doctor has before him a wide choice of careers. "Being a doctor" is by no means one profession, and too many young medical men slip into one or other of its branches without realising what the choice entails. It is very important that he should choose that career for which he is fitted by intelligence, aptitude, interest, and financial means. At the best a wrong choice at the outset may end in a re-start and wasted time, at the worst in the misapplication of a whole life. For this reason a young doctor should be careful not to enter on his life's work by taking the line of least resistance or by being led astray by mere names As an example of the former, many enter general practice simply because their fathers have a practice into which they can step, although they are by nature wholly unfitted for it. As an example of the fallacy of names, it is not unknown for idealists to enter the Public Service thinking that it will give them the best opportunities for public service, only to be terribly disillusioned.

Determinants

First with regard to intelligence. It must be realised at the outset that this is not the same thing as facility in passing examinations; the two may, and often do, go together, but there are plenty of first-class doctors who were always bad examinees but who do well because they possess common sense. It is a mistake to adopt from humility what one feels to be the simplest form of medical practice just because one does badly in examinations On the other hand, it would be rash to embark on a branch of medicine in which multiple degrees or diplomas are essential, such as consulting gynæcology, if examinations are always a difficulty.

Aptitude and interest usually, but not necessarily, go together. A man may be interested in administration and yet lack the organising faculty. The most energetic members of medical boards and committees are not always those whose activities are most useful. Interest should be the primary consideration. A doctor who chooses a branch of his profession simply to make money will certainly make a mistake If his real interest is in making money there are better ways of doing it. Medicine offers such a variety of interests that it should be put to a better use.

Financial means are correlative to interest. Private means are the greatest help in allowing the choice of whatever branch will ultimately bring the greatest satisfaction without any risk of anxiety in the meanwhile, but an intense desire to follow a particular bent can always be gratified by determination. Many highly specialised surgeons have had to work and stint themselves for years in order to achieve what they set out to do. One thing can, and should, be said: that the importance of earning a livelihood at once should never be allowed to weigh too heavily. It is a great temptation. The newly qualified man has passed through a long training, usually at considerable cost to others, and the thrill, to say nothing of the duty, of being at last self-supporting is a powerful incentive. And yet it should be allowed to count for practically nothing. The newly qualified doctor is qualified, but he is not a doctor. For many of his possible careers further experience and training are ...tial; for all of them they are an advantage.

...here are two things that every doctor should do ...st to achieve: a resident appointment in his ...school, and a locum tenency in general practice. All old teachers tell the same story—how they have constantly been told how much their old students regret in after life not having been a resident in their own hospital It is unfortunate, but natural, that for ever after, in judging a man's fitness for any post, it is felt that if he did not hold such an appointment it was, perhaps, because those who knew him best did not think he was good enough. And yet, time and again, young men throw away the opportunity for the sake of earning seven pounds a week instead of one. A post as locum tenens in a general practice, or in several general practices, is an invaluable experience, and can often be taken while waiting for the resident appointment. It does not matter what line is subsequently going to be chosen If general practice, then it is wise to make one's early mistakes (and there will be plenty of them) in someone else's practice. If consulting practice or a government post, nothing is more valuable than to *know*, at first hand, about general practice and general practitioners; and it teaches the arts of treatment and of dispensing in a way which even the perfect curriculum could not do

The possibility of travel should be considered, because this may be the last chance. Once embarked on a career, a doctor finds it very difficult to get away. At the outset there is time, and six months as a ship's surgeon, apart from present enjoyment, enlarges for life the outlook of one who might become much more parochial than he is apt to think likely. A few months of medical work on the Continent offer the additional advantage of learning a language thoroughly and of appreciating the outlook of one foreign nation, besides the stimulus of a Medicine which is bound to be in many ways very different. It is much less expensive than is usually supposed.

Many degrees do not necessarily make a good doctor, and the public is apt to judge as much by the number as by the nature of the letters, but it is becoming increasingly necessary, with the influx into the profession and the competiton for appointments, to hold such degrees and diplomas as will support an application on paper. For instance, the M.R C P. or the F R C.S. are usually compulsory qualifications for an applicant to a post on the staff of a large hospital, and the D.P H. is essential for advancement in the public services. Equally, a diploma in radiology, psychological medicine, child health, anæsthetics, tropical medicine, or clinical pathology is of the greatest value in its own special department, and the number of these special diplomas, as evidence of particular proficiency, is increasing. To a general practitioner none of them is essential but, as many general practitioners tend later to specialise in one branch of medicine or to take a part-time appointment in the public service, a higher qualification is often an advantage The decision is best taken early, because it is easier to pass examinations when young, and the opportunity for special study, even for writing an M D. thesis, does not come to a man engaged in a busy practice.

Independent Practice

Private practice, in one or other of its forms, offers the greatest possibilities of that variety of interest which comes from the combination of intimate human relationships and scientific work, and also the greatest financial rewards. The emoluments of medical practice in England are higher than on the Continent, and compare very favourably with those

of any profession in this country with the exception of the law The well educated doctor ranks high in society, he occupies much of the position, as adviser and friend, which was formerly held by the priest, and his long training in independent thought and action fits him to take his place as a leader in any community in which he works On the other hand, private practice demands hard work, tact, and forbearance, and often involves lean years of waiting before its rewards materialise Success depends on personal effort and initiative, and, although private practice will certainly provide a livelihood, it is the road to great fortune only for the few

GENERAL PRACTICE

General practice is the choice of the majority *It should not be thought that it is the last resort* into which a doctor goes because he is not good enough for anything else On the contrary, it demands the very best It is often truly remarked that any fool can become expert on a narrow specialty, but that it needs a first class man to be tolerably good at everything It is equally true that the tact in handling patients, which is necessary for consulting practice, is doubly necessary for general practice A consultant's dissatisfied patient goes away and is forgotten, a general practitioner's goes home and spreads dissatisfaction General practitioners fall into two main groups: the "Mayfair" practitioner in the heart of a large town, and the suburban or country doctor The social and financial rewards of the former are greater, so are the expenses and the risks The medical and human rewards of the latter are unsurpassed A preference for town or country life should be taken carefully into consideration

There are three ways of starting in general practice First, by "squatting," that is, putting up a plate and waiting for patients This involves least capital outlay, as it is only necessary to take a house, and, in a rapidly growing neighbourhood, is likely to be successful It tends, however, to lead to animosity and suspicion on the part of the other doctors in the district Secondly, by buying the goodwill of a practice on the retirement or death of its owner This usually costs from £1000 to £2000, and, although the money is easily borrowed, it will probably saddle a young man with a heavy debt for some years Thirdly, by joining a pre established partnership The purchase price of a share is much the same as the price of an independent practice, but partnership reduces overhead expenses, allows time for rest, holidays and study, and permits a certain degree of specialisation Much depends on the partners, a good partnership is perhaps the best of all medical careers, unpleasant partners may make it the worst

Some potential general practitioners are dissuaded by the prospect of the sleepless nights of midwifery It is possible to build up a practice without doing midwifery at all, but it takes longer and it cuts the doctor off in part from the confidence and friendship of his patients Similarly, some are suspicious of the work entailed by panel practice This is unnecessary Contract patients are, on the whole extraordinarily thoughtful of the convenience of their doctor and, if he wholeheartedly does his duty by them, are as intimately his patients and friends as those who pay fees It depends entirely on the doctor Most general practitioners (and some consultants) have a panel, and it is of value in providing a known and reliable annual income The practitioner receives on the average about £420 a year from panel patients

CONSULTING PRACTICE

A consulting practice cannot be bought and it cannot be entered by partnership To build up a practice it is almost essential to be on the visiting staff of a hospital, and preferably of one with a medical school This involves an aptitude for, and a pleasure in, teaching, and, as it is only possible to remain a first-class teacher by doing original research, a prospective consultant should be sure he possesses these aptitudes and interests That is why it is not the *best* doctors who should be consultants but those of a particular type It is possible, though much more difficult, to succeed as a consultant without a hospital appointment, but it is always at the risk of being regarded by colleagues as a "consultoid"

Consultants have, in the past, been specialists only in the sense that they have restricted their practice to one of the three main branches of the profession medicine, surgery, or gynæcology With the improved standard of general practice and the increase of specialising partnerships, the general consulting physician is being superseded, and specialisation in all directions is increasing, for better or worse, and it is impossible to draw a line between the consultant and the specialist The line between the general practitioner and the consultant is itself vague, since any doctor who sees a patient with a colleague is a consultant It is generally taken, however, that a consultant sees patients only on the recommendation of a general practitioner, and, although there is an increasing tendency for patients to go direct to a specialist of their own choice, it is really in the interests both of the public and of the profession that consultants should adhere rigidly to their proper function Success in consulting practice demands very hard work and years of waiting, and, unless the aspirant has private means, he must in addition to his medical work be prepared to do a great deal more to make ends meet The late Sir Raymond Crawfurd said that a young consultant is always an examination coach, a lodging house keeper, or a journalist's hack There is, moreover, great competition both in "Harley-street" and in the hospitals, and the expenses are almost as high for a very small practice as for a very large one It is often difficult for a young consultant to marry In the end, energy and determination are rewarded, and the final success, when it comes, is very great

The possibilities of consulting practice in provincial towns are increasing, both in connexion with the universities and their medical schools and as a development from general practice Many good general practitioners in the large towns specialise and act largely as consultants, but this movement is being offset by the increase in large partnerships in which the partners specialise, particularly in the direction of doing their own major surgery Although there are excellent openings for consultants in the provinces it is, in most branches, difficult for a man confining himself strictly to a specialty to make a living outside London Specialisms such as clinical pathology may combine a salaried post in a hospital with private practice and thus be easier at the outset Others, such as radiology, involve large capital outlay

OPENINGS ABROAD

Medical registration is reciprocally accepted between Britain and Italy, Japan and some of the Dominions The scope for practice abroad is limited, these foreign countries and the Dominions produce enough (and sometimes too many) doctors for their own needs Care must be taken to make sure that a

CHOICE OF A CAREER

THE newly qualified doctor has before him a wide choice of careers. "Being a doctor" is by no means one profession, and too many young medical men slip into one or other of its branches without realising what the choice entails. It is very important that he should choose that career for which he is fitted by intelligence, aptitude, interest, and financial means. At the best a wrong choice at the outset may end in a re-start and wasted time, at the worst in the misapplication of a whole life. For this reason a young doctor should be careful not to enter on his life's work by taking the line of least resistance or by being led astray by mere names As an example of the former, many enter general practice simply because their fathers have a practice into which they can step, although they are by nature wholly unfitted for it As an example of the fallacy of names, it is not unknown for idealists to enter the Public Service thinking that it will give them the best opportunities for public service, only to be terribly disillusioned.

Determinants

First with regard to intelligence. It must be realised at the outset that this is not the same thing as facility in passing examinations; the two may, and often do, go together, but there are plenty of first-class doctors who were always bad examinees but who do well because they possess common sense. It is a mistake to adopt from humility what one feels to be the simplest form of medical practice just because one does badly in examinations. On the other hand, it would be rash to embark on a branch of medicine in which multiple degrees or diplomas are essential, such as consulting gynæcology, if examinations are always a difficulty.

Aptitude and interest usually, but not necessarily, go together. A man may be interested in administration and yet lack the organising faculty. The most energetic members of medical boards and committees are not always those whose activities are most useful. Interest should be the primary consideration. A doctor who chooses a branch of his profession simply to make money will certainly make a mistake. If his real interest is in making money there are better ways of doing it. Medicine offers such a variety of interests that it should be put to a better use.

Financial means are correlative to interest. CONSULTING PRACTICE

A consulting practice cannot be bought and it cannot be entered by partnership To build up a practice it is almost essential to be on the visiting staff of a hospital, and preferably of one with a medical school This involves an aptitude for, and a pleasure in, teaching, and, as it is only possible to remain a first-class teacher by doing original research, a prospective consultant should be sure he possesses these aptitudes and interests That is why it is not the *best* doctors who should be consultants but those of a particular type It is possible, though much more difficult, to succeed as a consultant without a hospital appointment, but it is always at the risk of being regarded by colleagues as a "consultoid"

Consultants have, in the past, been specialists only in the sense that they have restricted their practice to one of the three main branches of the profession medicine, surgery, or gynæcology With the improved standard of general practice and the increase of specialising partnerships, the general consulting physician is being superseded, and specialisation in all directions is increasing, for better or worse, and it is impossible to draw a line between the consultant and the specialist The line between the general practitioner and the consultant is itself vague, since any doctor who sees a patient with a colleague is a consultant It is generally taken, however, that a consultant sees patients only on the recommendation of a general practitioner, and, although there is an increasing tendency for patients to go direct to a specialist of their own choice, it is really in the interests both of the public and of the profession that consultants should adhere rigidly to their proper function Success in consulting practice demands very hard work and years of waiting, and, unless the aspirant has private means, he must in addition to his medical work be prepared to do a great deal more to make ends meet The late Sir Raymond Crawfurd said that a young consultant is always an examination coach, a lodging-house keeper, or a journalist's hack There is, moreover, great competition both in "Harley-street" and in the hospitals, and the expenses are almost as high for a very small practice as for a very large one It is often difficult for a young consultant to marry In the end, energy and determination are rewarded, and the final success, when it comes, is very great

The possibilities of consulting practice in provincial towns are increasing, both in connexion with the universities and their medical schools, and as a development from general practice. Many good general practitioners in the large towns specialise and act largely as consultants, but this movement is being offset by the increase in large partnerships in which the partners specialise, particularly in the direction of doing their own major surgery Although there are excellent openings for consultants in the provinces it is in most branches, difficult for a man confining himself strictly to a specialty to make a living outside London Specialisms such as clinical pathology may combine a salaried post in a hospital with private practice and thus be easier at the outset Others, such as radiology, involve large capital outlay

OPENINGS ABROAD

Medical registration is reciprocally accepted between Britain and Italy, Japan and some of the Dominions The scope for practice abroad is limited, these foreign countries and the Dominions produce enough (and sometimes too many) doctors for their own needs Care must be taken to make sure that a

qualification is adequate before deciding, especially in the case of Canada, where the registration laws are peculiar. In the rest of the Commonwealth a registered British qualification is sufficient. Private practice in any of the larger towns has much the same features as private practice at home Climatic conditions may be worse (the terrors of tropical climates have been grossly over-estimated) but the life appeals to many and the financial reward is considerable.

Public Services

Apart from the part-time appointments, such as consultant to the L C.C, which offers valuable additions of interest, experience, and salary, the public service is a very different career from private practice in its regular hours, a known salary and, in most cases, a pension. Promotion goes mainly by seniority and, provided he makes no serious mistake, a properly qualified man may be pretty certain that, once embarked on it, he will in due course find himself somewhere near the top of the tree On the other hand, individual effort, originality, and extra work may find less reward than they do in private practice

A great variety of occupations is included under the public service, from purely clinical to purely administrative, but it must be remembered that in most cases every promotion means less clinical and more administrative work, and the higher posts are chiefly administrative. It is therefore temperament which should lead a man to decide between public and private practice.

HOSPITAL APPOINTMENTS

Since the Local Government Act of 1929, a vast number of poor-law infirmaries, besides fever hospitals and mental hospitals, have passed under the control of the local authorities and have been greatly transformed. In London the County Council took over 76 hospitals and institutions, including 28 general hospitals. In many of the larger towns similar changes have taken place, and indeed Manchester has progressed a long step forward in setting up a Joint Hospitals Advisory Board to coördinate the voluntary and municipal hospitals in one scheme Medical appointments in London consist of whole-time hospital staffs and consultants The whole-time staffs are graded according to seniority and the size of the hospital, and range from house physicians and surgeons at £120 a year, through assistant medical officers starting at £350, senior assistants at about £600, deputy medical superintendents at about £700 to medical superintendents at a maximum of £1,650 The best appointments are, of course, few, and high qualifications, both medical and administrative, are required. Preference is given in all appointments to officers with the M.D. or M.R.C P or corresponding surgical qualifications.

Medical officers have considerable freedom, but those used to voluntary hospital standards are liable to feel their efforts stultified by the large number of patients they have to look after (the proportion is about 80 patients per medical officer as compared with about 10 in the voluntary hospitals) It is easy for anyone contemplating the service as a career to gain first-hand experience by taking a post as house physician or surgeon. If it proves uncongenial, nothing is lost, because these posts give valuable experience to any doctor In the L C C area living-in is no longer compulsory in the senior appointments, and allowances are made in lieu of board and lodging Ordinary leave and study-leave with pay are allowed. Some of the appointments take previous resident experience, and newly qualified men should be warned that the requirement may not arise for some years, when promotion may be found to be blocked by failure to have held a resident appointment earlier.

The mental and fever hospitals offer opportunities similar to those of the general hospitals. Prospective medical officers should bear in mind the need for the diploma of psychological medicine or public health in these two branches. A large number of part-time consultants are employed by the L C C. at a salary of £125 per annum for one session a week These posts are purely consultative to the staffs of the hospitals, but provide valuable clinical experience in addition to a fixed salary.

PUBLIC HEALTH

Medical officers of health are appointed to counties, county boroughs, boroughs, and urban and rural districts More than half of them are still part-time officers, combining their public office, for which they receive a salary, with a general practice, especially in the smaller and less populated districts, but the number of whole-time appointments is increasing, and they will in future be universal. It is unlikely that a new entrant into the public health service would be allowed private practice. For a full-time M O H the diploma of public health, sanitary service, or state medicine is obligatory, and it is very important that candidates should have had the experience of resident hospital appointments, particularly in special departments. The duties of a M.O.H. are to supervise the environmental, infectious diseases, maternity and child welfare, tuberculosis and venereal diseases services, and to advise the sanitary authority The school medical service is often (and increasingly) under his control, and he may have a considerable staff working under him. The salaries of assistant medical officers is from £500–£700, of senior medical officers from £750, and of M.O.H 's from £800–£2000 The highest paid posts are administrative; the salaries of clinical specialists seldom rise above £950 Provision is made for superannuation and for holidays with pay. There is security of tenure for the majority of posts About 120 medical officers are now employed directly by the Ministry of Health The public health service has, obviously, many attractions; its drawbacks are simply those inherent in lay, and it may be political, control Appointing authorities are more likely to be impressed by evidence of experience than by degrees or diplomas

School medical officers are appointed to perform, among other duties, the routine examination of school children In some areas they report to the local authority and recommend treatment, but do not treat; in others they are responsible for minor treatment. There is little variety in the work. Many specialists, in orthopædic and ear, nose and throat disease, for instance, are employed by the public health service Tuberculosis officers are experts in tuberculosis, who run the dispensaries and are responsible for organisation and diagnosis, and who recommend treatment In some cases they carry out treatment themselves. Venereal diseases officers are either whole- or part-time and are responsible for diagnosis and treatment in the clinics

DEFENCE SERVICES

The Royal Naval Medical Service, the Royal Army Medical Corps, and the Medical Branch of the Royal Air Force offer great attractions to those who are temperamentally suited for a life in the forces The pay and conditions are good and there is a prospect

of a pension sufficient to provide a comfortable livelihood or to form a very helpful supplement to the earnings from a small general practice There are now no entrance examinations but appointments are made after an interview Commissions are granted in the first place on a short term basis for three years, which may be extended to five After four years, officers have the opportunity to apply for transfer to the permanent list and just now they have an excellent chance of being accepted Those who leave the service after three or five years receive a gratuity of £400 or £1000 For those who stay on, promotion is automatic with steadily increasing pay for the first 16 years or so, by which time an officer should be earning about £1000 a year The commencing salaries are from £360 to £438 The scale throughout is not quite as high in the R A M C as in the other two services, but in all it is enough to allow a young officer to live without private means and to marry when he is about 30 For those who are accepted for the permanent list there is an excellent opportunity for learning and practising a specialty, which carries extra emoluments and may well be a source of income after retirement The usual retiring age is 55 and the average pension would then be about £500 a year A more detailed account of these services is given under their respective headings

INDIAN MEDICAL SERVICE

This is primarily a military service, but officers are eligible for 142 civil posts It offers a great variety of occupations, including many research appointments and posts on the staffs of teaching hospitals For the first class man it is probably the best of the services, for the average or second rate man, it would not be likely to be so suitable Candidates should be under 32 and are selected by the Secretary of State for India The rates of pay range from about £600 to £1800 per annum and pensions are similar to those in the other services With certain exceptions, officers are allowed private practice

COLONIAL MEDICAL SERVICE

Candidates should be under 35 and must obtain a certificate of physical fitness After admission they are given a course of instruction in tropical medicine which is paid for by the government Conditions of service and superannuation vary very greatly in different Colonies and careful inquiries should be made as to local conditions and the possibilities of private practice *Rates of pay are relatively* low, but this is offset by low costs of living and supplementary earnings from private practice where this is allowed. The life offers much more scope for adventure and varied professional experience than practice in this country and the possibilities of specialisation and research are increasing It is the career par excellence "for all who like a life of freedom, the open air, responsible work, and a feeling of individuality which life in a crowd can never give"

Other Salaried Posts

RESEARCH AND LABORATORY WORK

Research work on grants is either a preliminary to consulting practice or an academic post, and is rich in intellectual rewards, but relatively ill paid, and likely to attract only those with a vocation Full time posts as professors or readers combine a competence, with freedom from present anxiety and the prospect of a pension, with every opportunity for teaching and research, but these are exceptional posts for exceptional men

INDUSTRIAL APPOINTMENTS AT HOME AND ABROAD

A certain number of large commercial undertakings employ full time medical officers There are about 50 such posts in the country The duties consist of the prevention and treatment of industrial accidents, poisoning, and the like, the giving of advice to both management and worker, and "welfare" work in general The duties naturally vary enormously in the different concerns The salaries are similar to those of medical officers of health Besides full time officers, there is a much greater number of *part time posts, held by general practitioners*, at salaries up to as much as £1800 a year The functions of industrial medical officers have in the past overlapped with those of certifying factory surgeons ("examining surgeons" under the new Factory Act) and general practitioners, but their spheres of action are being delimited An interest in sociology is an important qualification for most of these posts, as the work should, at its best, be far more than narrowly medical, and in many ways psychology is as important as surgery

The Post Office Medical Service comes under the same general heading This is a very large organisation, providing free medical attention to many thousands of employees outside the National Health Insurance scheme Here again, besides the whole-time headquarters staff, about 1800 doctors are employed on a part-time basis

There are many opportunities in connexion with rubber and tea plantations, engineering works, mines, &c These posts are remunerative and full of interest, the work is largely preventive and malaria control is an important part of it The status of this branch of the profession is rapidly rising The Ross Institute in London is the meeting ground of the commercial and medical interests, to which inquiries for medical officers and applications for posts for the most part go. Most of the appointments are for a definite time, but open to renewal, and tenure is, in actual fact, secure They are not pensionable, but the rates of remuneration are proportionately higher (£1000–£3000 a year with many incidental allowances) Adequate leave is granted on full pay

Careers for Women

Women doctors can and do engage in almost every type of practice open to men There are now over 6000 medical women on the Register out of a total of some 60,000 An analysis made ten years ago by the Medical Women's Federation showed that at that time a thousand of its members were distributed as follows —

	per cent.
General practice	40 6
Hospital and institutional	12 7
Consulting and specialist	14·0
Research	3 6
Public health	15 6
Retired	9 0
Not ascertained	4 5

The number, status, and prosperity of women general practitioners and consultants are on the increase, and there are now women medical officers of health, professors, and school and industrial medical officers, and many women are employed abroad in the Colonial Service, the Women's Medical Service for India, the missionary services, and so on Though as a general rule honorary appointments at hospitals are not

open to women there are hospitals staffed entirely by women in London, Edinburgh, Glasgow, Manchester, Bristol, and Brighton

Women may still be handicapped in reaching the highest posts under local authorities. The L.C.C have now removed the illogical marriage bar which some authorities still exercise and the Civil Service Departments now have a "saving" clause that in certain circumstances resignation will not be enforced on marriage. There are some figures that suggest that women do as well or better in general practice than men, partly because the limitation of women students at the medical schools has the effect of raising the standard and of making women doctors on the average better educated than their male colleagues. The special aptitudes and interests of women give them particular advantages in school medical inspection, child welfare, and midwifery, which more than offset the prejudice that some members of the public still feel against them.

HIGHER QUALIFICATIONS

APART from university degrees already mentioned higher qualifications in medicine, surgery, and obstetrics are granted by various professional corporations.

ROYAL COLLEGE OF PHYSICIANS OF LONDON

THE MEMBERSHIP AND FELLOWSHIP M.R.C.P. AND F.R.C.P.

The College confers two separate diplomas—the *Fellowship*, a purely honorary distinction, and the *Membership*, obtained by examination

Membership.—The age for admission to this diploma, it will be noticed, has been changed from 25 to 23 years. The alteration in the by-law of the College is designed to enable men who have just finished house appointments to sit for an examination for which their recent clinical experience has exactly fitted them. The candidate must either have obtained the licence of the College, or a degree of doctor or bachelor of medicine at a university which is registrable by the General Medical Council and is recognised by the Censors Board. The examination is directed partly to pathology and partly to the practice of medicine Credit is also given to candidates who show a knowledge of French or German, and there is a definite small allotment of marks for these optional subjects in the total qualifying marks. Further information may be obtained from the registrar at the College.

Fellowship.—Fellows are selected annually from the ranks of members by the Council of the College.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

THE FELLOWSHIP F.R.C.S.

The College confers its diploma of Fellow upon a few distinguished persons in an honorary capacity. Four Members of long standing may also be elected to the Fellowship annually. The bulk of the Fellows, however, obtain the diploma as the result of an examination. This is divided into two parts—viz., the primary examination and the final examination The subjects of the primary examination are anatomy and physiology and those of the final examination surgery, including surgical anatomy, and pathology. The examinations are partly written and partly viva voce, and include the examination of patients and the performance of operations on the dead body. The primary examination is held in June and December and the final in May and November.

Admission to the Primary Examination.—A member of the College is admissible to the primary examination at any time after receiving his diploma of membership. A candidate who is not a member is admissible after passing the first professional examinations of the English Conjoint Board in anatomy and physiology, or the equivalent examination in a recognised university, on the production of certificates of attendance upon prescribed courses.

Admission to the Final Examination.—For members of the College or graduates in medicine who passed the primary examination before Jan. 1st, 1935, the conditions of admission are as follows: (1) A member of the College is admissible to the final examination at any time after having passed the primary examination, on producing satisfactory evidence of having been engaged for not less than six years in the study (or study and practice) of the profession (2) A candidate who is not a member of the College, but who possesses a qualification recognised by the Council for the purpose, is admissible to the final examination, after having passed the primary examination, on the production of evidence of having been engaged in the study (or study and practice) of the profession for not less than four years subsequent to the date of obtaining the recognised qualification, one year of which shall have been spent in attendance upon the surgical practice of a recognised hospital or infirmary

For all other candidates the conditions of admission are as follows: A candidate who has passed the primary examination and who is *either* (*a*) a member of the College who can produce satisfactory evidence of having been engaged in the study (or study and practice) of the profession for not less than six years, *or* (*b*) *a graduate of four years' standing* in medicine and surgery in a university recognised by the Council for the purpose, is admissible to the final examination on producing evidence that he has held for not less than six consecutive months the post of resident house surgeon, or other responsible post in charge of general surgical patients in the wards of a general hospital recognised by the Council for the purpose

Note.—In compliance with a condition of the Charter the Diploma of Fellow is not conferred upon successful candidates until they have attained the age of 25 years.

ROYAL COLLEGE OF OBSTETRICIANS AND GYNÆCOLOGISTS

THE MEMBERSHIP AND FELLOWSHIP M.R.C.O.G AND F.R.C.O.G.

One of the principal objects of the College is to encourage the study and practice of obstetrics and gynæcology, subjects which should be inseparably interwoven. The College consists of fellows and members.

Candidates for the *Membership* must have been entered on the British Medical Register for at least three years or be eligible for entry thereon Before being accepted for the examination they must produce

evidence, satisfactory to the Examination Committee of having held resident hospital appointments in general medicine or surgery and in obstetrics and gynæcology for the period laid down in the regulations (at present six months each) Candidates who are accepted for examination must present records of 25 obstetrical and 10 gynæcological selected and personally attended cases and be prepared to discuss these in the examination, they must also present two commentaries on individual cases or groups of cases The examination consists of two written papers, a clinical examination, and a viva voce on pathology and case records

The *Fellowship* of the College is granted to those members who are judged to have advanced the science and art of obstetrics and gynæcology

The fellowship and membership of the College include practically every teacher of obstetrics and gynæcology in Great Britain and the British Dominions Fellowship or membership is now a necessary qualification for election to the staff of many obstetric and gynæcological hospitals and it is anticipated that in time it will be essential for election to the staff of all such hospitals, consequently all intending to specialise in obstetrics and gynæcology should endeavour to obtain the membership as soon as possible.

The regulations may be obtained from the hon secretary, Royal College of Obstetricians and Gynæcologists, 58, Queen Anne street, London, W 1

SOCIETY OF APOTHECARIES OF LONDON

MASTERY OF MIDWIFERY
M M S A

The examinations for this diploma are held in May and November Candidates will be admitted to the examination who have been registered practitioners for at least three years and who have held a resident appointment in an institution recognised by the Society for six months or more, and who for three months in each case have attended an antenatal clinic and an infant welfare centre, also recognised by the Society Medical officers employed by a public health authority, and having special duties connected with maternity and child welfare, will be admitted to the examination on production of evidence to that effect The examination will be conducted by written papers and by clinical and oral tests

Further information can be obtained from the registrar, Apothecaries Hall, Water lane, E C

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

THE MEMBERSHIP AND FELLOWSHIP
M R C P E AND F R C P E

Membership.—A candidate, who must be a licentiate of a British or Irish College of Physicians, or a graduate in medicine of a university, approved by the Council, and 24 years of age, is examined in medicine, therapeutics, and in any branch of the departments of medicine specially professed, such as general pathology, psychiatry, public health, obstetrics, gynæcology, diseases of children, tropical medicine, or medical jurisprudence.

Fellowship.—The Fellows are selected annually from the ranks of the Members by the Council of the College.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

THE FELLOWSHIP
F R C S E

The College grants a diploma of fellowship after examination to the holders of British surgical degrees or diplomas and the holders of recognised degrees of the Universities of Canada, Australia, New Zealand, and India Candidates must be 25 years of age and in practice for at least two years, and they must give three weeks' notice of their intention to appear for examination The examination is written and viva voce, and includes surgery and surgical anatomy, operative surgery, and clinical practice One optional subject must also be taken, the range of these specialisms covering nearly every branch of medicine Candidates are not allowed to appear more than three times at the examinations, unless by permission of the President's Council

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

THE FELLOWSHIP
F R F P S

The Royal Faculty of Physicians and Surgeons grants, after examination, a fellowship which is registrable by the General Medical Council as an additional qualification For the fellowship qua physician or the fellowship qua surgeon, the candidate must pass in medicine or surgery as the primary subject and an additional subject cognate with medicine or surgery respectively must also be taken at the same examination Candidates are required to be approved by the Council before admission to the examination Successful candidates are later balloted for election by the Faculty and if elected, are duly admitted qua physician or qua surgeon Examinations are held quarterly The regulations respecting the fellowship, together with the dates of the examinations, may be obtained on application to the secretary, Royal Faculty of Physicians and Surgeons, 242, St Vincent-street, Glasgow, C 2

ROYAL COLLEGE OF PHYSICIANS OF IRELAND

THE MEMBERSHIP AND FELLOWSHIP
M R C P I AND F R C P I

Membership.—This is granted on the result of an examination, held in February, June, and November each year

Fellowship.—Fellows are elected by ballot An applicant must have been a Member of the College for at least one year and must have attained the age of 27 years

Further particulars can be obtained from the registrar of the College at 6, Kildare street, Dublin

ROYAL COLLEGE OF SURGEONS IN IR

THE FELLOWSHIP
F R C S I.

Candidates for the Fellowship shall make application to the president and council to be admitted to examination They are required to pass examinations—primary and final Candidates present themselves for the final examination after passing the primary examination they have complied with the necessary regulations The subjects for the primary

are (*a*) anatomy, including dissections; and (*b*) physiology and histology. The subjects for the final examination are surgery, including surgical anatomy and pathology. For admission to the final examination the candidate must have passed the primary examination, and must be a licentiate or graduate in surgery of a university or licensing body recognised by the General Medical Council; candidates must be not less than 25 years of age.

Further particulars can be obtained from the registrar of the College, Stephen's Green West, Dublin.

SPECIAL DIPLOMAS

PUBLIC HEALTH

A diploma in public health (D.P H.) is granted by most of the British universities and by the English, Scottish, and Irish Conjoint Boards The courses of study are on the same general lines in all the centres since they are governed by rules laid down by the General Medical Council. These rules are as follows:

(1) A period of not less than two years shall elapse between the attainment by a candidate of a qualification in medicine, surgery, and midwifery and the grant of a diploma or degree in sanitary science, public health or state medicine

(2) The curriculum for a diploma or degree in sanitary science, public health or state medicine shall extend over a period of not less than (*a*) twelve calendar months of which not less than three consecutive calendar months shall be devoted to the whole-time study of the subjects comprised in Rule 3, or (*b*) an academic year of whole-time study covering a period of not less than nine calendar months, subsequent to the attainment of a medical qualification.

(3) Every candidate shall attend a course lasting not less than 280 hours at an institution approved by the licensing body granting the diploma or degree, during which he shall have received theoretical and practical instruction in (*a*) bacteriology and parasitology (including immunology, serology, and medical entomology), in relation to the public health; (*b*) the application of the principles of physiology and biochemistry to environmental and personal hygiene and to the public health; (*c*) the application of the principles of chemistry and physics to environmental and personal hygiene and to the public health.

(4) Every candidate shall attend a course lasting not less than 160 hours at an approved institution during which he shall have received instruction in . (*a*) the principles of hygiene, sanitation, and public health; (*b*) epidemiology and vital statistics (including statistical method); (*c*) public health law and administration; (*d*) industrial hygiene and the welfare of industrial workers; (*e*) house planning and sanitary construction; (*f*) the principles of genetics; (*g*) mental hygiene.

(5) Every candidate shall attend for three months on the clinical practice of an approved hospital for infectious diseases.

(6) Every candidate shall produce evidence that he has, during a period of not less than six months, been engaged in acquiring a practical knowledge of the duties, routine and special, of public health administration under the supervision of a medical officer of health

(7) The examination for the Diploma or Degree shall be divided into two parts, Part I and Part II.

A candidate must pass Part I before being admitted to examination for Part II, and in both parts a candidate must pass in all the specified subjects at one time

(8) Part I shall include written and oral examinations in the subjects comprised in Rule 3, together with a practical laboratory examination in the subjects specified in Rule 3 (*a*)

(9) The examination for Part II shall include the subjects referred to in Rules 4, 5, and 6 The examination shall be written and oral, and shall include clinical examinations in infectious diseases, and practical examinations in food inspection and inspection of premises, including dwellings, factories, workshops, and schools

PSYCHOLOGICAL MEDICINE

The Universities of London, Durham, Leeds, Manchester, Edinburgh, Dublin (Trinity College), Ireland (National University), and the English and Irish Conjoint Boards grant diplomas in psychological medicine under conditions that are fairly comparable in the standard of the tests and in the duration of the courses.

University of London

Candidates for the D.P.M. must hold a registrable qualification and must either have held a resident or whole-time appointment at an approved institution for mental diseases for six months, or have attended the practice of such an institution for 12 months before taking part B of the examination. The examination is held twice a year and consists of two parts. Part A includes the anatomy, histology, and physiology of the nervous system and psychology; part B neurology and psychological medicine Candidates are examined in both mental diseases and mental deficiency and are required to give evidence of a higher knowledge in one or other of these branches.

University of Durham

The university grants a diploma in psychiatry (D Psy), and the medical school, King's College, Newcastle-upon-Tyne, includes a department of instruction in psychological medicine. The candidate must be a registered medical practitioner, and subsequent to qualification have received instruction in anatomy and physiology of the brain and nervous system The examination is divided into two parts, Part I dealing with anatomy, physiology, pathology, and bacteriology; Part II with psychology and experimental psychology, neurology and psychiatry. Candidates may present themselves for the whole examination or for either part separately. The course of training is very detailed, post-mortem technique being the subject of a series of sessions.

University of Leeds

The university grants a diploma in psychologica medicine to graduates in medicine of at least one year's standing who have received systematic instruction on the normal and morbid anatomy of the brain, and have held an appointment in a mental hospital. The examination is divided into three parts: Part I deals with general psychology and the structural development and physiology of the nervous system; Part II with the pathology of that system; and Part III with clinical psychiatry, the administration of mental hospitals, and the medico-legal aspects of insanity. Candidates may present themselves for the three parts simultaneously or separately; they may submit a thesis or published work which, if approved, will gain certain exemptions

University of Manchester

The university grants a diploma in psychological medicine to graduates of at least one year's standing The examination is held in two parts. Before presenting themselves for Part I candidates must,

subsequent to qualification, have attended approved courses in the structure of the nervous system and in experimental psychology Before presenting themselves for Part II they must produce evidence of having gone through an approved course of instruction in the pathology of the nervous system and in clinical neurology, and of having attended demonstrations in psychological medicine, and received clinical instruction, either as residents or, in approved cases, as daily attendants, at an approved hospital for mental diseases The course extends over a period of three university terms, two of which must be taken in the university, and candidates may present themselves for both parts simultaneously or for each separately

University of Edinburgh

The course for the D P M extends over one term and is given from January to March Candidates are required subsequent to the date of graduation or obtaining a recognised qualification to have held (*a*) a resident appointment for one year in a hospital for mental disorders approved by the faculty of medicine, or alternatively (*b*) a six months' appointment as defined in (*a*) and six months' practical study of nervous diseases in a special or general hospital approved by the faculty There are two examinations for the diploma, both of which are held in March Part I comprises anatomy and physiology of the nervous system, psychology Part II comprises neuropathology, psychiatry and clinical psychiatry, clinical neurology Candidates who have held an asylum appointment for a period of five years or more may be exempted from the course of study in one or more subjects of the curriculum Alteration of certain sections of the regulations is at present under consideration Full particulars can be obtained from the dean of the faculty of medicine

University of Dublin (Trinity College)

The D P M is conferred upon registered medical practitioners who have held a resident medical appointment at a recognised institution for the treatment of mental diseases for 12 months, or who have held such an appointment for six months and have attended clinical instruction at an approved institution for six months Candidates must also attend special courses of instruction and pass a special examination Details can be obtained from the registrar of the school of physic, Trinity College, Dublin

National University of Ireland

The D P M may be conferred on registered medical practitioners who, although they may not have matriculated at the University, have completed the prescribed course of study A certificate of post graduate work will be required from the candidates, either in the study of mental disease or as medical assistant in an asylum Application [illegible] be made to the registrars of the constituent coll University College, Dublin, University College, C and University College, Galway, for all inf[illegible]

English and Irish Conjoint Boards

Candidates for the diploma granted by t[illegible] must pass two examinations Part I (*a*) anatomy and physiology of the (*b*) psychology Part II consists including clinical and patholc (*b*) psychological medicine, inc tionship Further information be obtained from the secretary management

RADIOLOGY

Faculty of Radiologists

The fellowship of the Faculty (F F R) is intended to meet the need for a higher radiological qualification and is obtainable by examination and submission of a thesis Candidates must be eligible for membership of the Faculty (i e, have practised radiology, or radiology and electrotherapeutics exclusively for at least three years), registered medical practitioners of at least five years' standing, and radiological diplomates of at least two years' standing After 1940 candidates will also be required to have spent at least a year in general clinical work at approved hospitals

The examination is held annually in London at the beginning of December The candidate must pass an examination on an honours standard in radio-diagnosis and/or radiotherapy, and on a pass standard in general medicine, general surgery and pathology, with special reference to diseases in which radiology is concerned A thesis on some special subdivision of the candidate's radiological subject is also required, and can be presented either before or after taking the examination

Candidates need not necessarily be members of the Faculty in order to sit for the fellowship examination, but an approved candidate must be elected as such before he can be admitted a fellow The examination fee is 10 guineas, and the fellowship fee for successful candidates 20 guineas

Further particulars may be obtained from the warden, Faculty of Radiologists, 32, Welbeck-street, London, W 1

University of Cambridge

The teaching for this has hitherto been partly in Cambridge and partly in London, but it is likely that no further teaching will be undertaken in Cambridge and that the granting of the D M.R E will cease in 1941 The course begins in October and lasts nine months The first four months are occupied with (*a*) lectures and practical work in physics, in preparation for the examination for Part I in February, (*b*) an introductory course of clinical instruction in radiology and electrology, (*c*) a course of instruction in pathology in relation to radiology and electrology The next three months are occupied with (*a*) lectures and demonstrations in radiology and electrology (including radium therapy) organised by the British Institute of Radiology, (*b*) clinical instruction in the radiological department of a hospital approved by the committee During the final two months of the course a candidate must hold a clinical clerkship or similar appointment in the radiological department of a hospital [illegible] the committee This part of [illegible]e in London, or elsewhere [illegible] Part II is held in July [illegible]rticulars as to courses and [illegible] from the secretary

are (*a*) anatomy, including dissections; and (*b*) physiology and histology. The subjects for the final examination are surgery, including surgical anatomy and pathology. For admission to the final examination the candidate must have passed the primary examination, and must be a licentiate or graduate in surgery of a university or licensing body recognised by the General Medical Council, candidates must be not less than 25 years of age.

Further particulars can be obtained from the registrar of the College, Stephen's Green West, Dublin.

SPECIAL DIPLOMAS

PUBLIC HEALTH

A diploma in public health (D P.H) is granted by most of the British universities and by the English, Scottish, and Irish Conjoint Boards. The courses of study are on the same general lines in all the centres since they are governed by rules laid down by the General Medical Council. These rules are as follows:

(1) A period of not less than two years shall elapse between the attainment by a candidate of a qualification in medicine, surgery, and midwifery and the grant of a diploma or degree in sanitary science, public health or state medicine

(2) The curriculum for a diploma or degree in sanitary science, public health or state medicine shall extend over a period of not less than (*a*) twelve calendar months of which not less than three consecutive calendar months shall be devoted to the whole-time study of the subjects comprised in Rule 3, or (*b*) an academic year of whole-time study covering a period of not less than nine calendar months, subsequent to the attainment of a medical qualification.

(3) Every candidate shall attend a course lasting not less than 280 hours at an institution approved by the licensing body granting the diploma or degree, during which he shall have received theoretical and practical instruction in (*a*) bacteriology and parasitology (including immunology, serology, and medical entomology), in relation to the public health; (*b*) the application of the principles of physiology and biochemistry to environmental and personal hygiene and to the public health; (*c*) the application of the principles of chemistry and physics to environmental and personal hygiene and to the public health.

(4) Every candidate shall attend a course lasting not less than 160 hours at an approved institution during which he shall have received instruction in: (*a*) the principles of hygiene, sanitation, and public health; (*b*) epidemiology and vital statistics (including statistical method); (*c*) public health law and administration; (*d*) industrial hygiene and the welfare of industrial workers; (*e*) house planning and sanitary construction; (*f*) the principles of genetics; (*g*) mental hygiene.

(5) Every candidate shall attend for three months on the clinical practice of an approved hospital for infectious diseases

(6) Every candidate shall produce evidence that he has, during a period of not less than six months, been engaged in acquiring a practical knowledge of the duties, routine and special, of public health administration under the supervision of a medical officer of health.

(7) The examination for the Diploma or Degree shall be divided into two parts, Part I and Part II.

A candidate must pass Part I before being admitted to examination for Part II, and in both parts a candidate must pass in all the specified subjects at one time

(8) Part I shall include written and oral examinations in the subjects comprised in Rule 3, together with a practical laboratory examination in the subjects specified in Rule 3 (*a*)

(9) The examination for Part II shall include the subjects referred to in Rules 4, 5, and 6 The examination shall be written and oral, and shall include clinical examinations in infectious diseases, and practical examination in food inspection and inspection of premises, including dwellings, factories, workshops, and schools

PSYCHOLOGICAL MEDICINE

The Universities of London, Durham, Leeds, Manchester, Edinburgh, Dublin (Trinity College), Ireland (National University), and the English and Irish Conjoint Boards grant diplomas in psychological medicine under conditions that are fairly comparable in the standard of the tests and in the duration of the courses.

University of London

Candidates for the D P M must hold a registrable qualification and must either have held a resident or whole-time appointment at an approved institution for mental diseases for six months, or have attended the practice of such an institution for 12 months before taking part B of the examination. The examination is held twice a year and consists of two parts. Part A includes the anatomy, histology, and physiology of the nervous system and psychology; part B neurology and psychological medicine Candidates are examined in both mental diseases and mental deficiency and are required to give evidence of a higher knowledge in one or other of these branches.

University of Durham

The university grants a diploma in psychiatry (D Psy), and the medical school, King's College, Newcastle-upon-Tyne, includes a department of instruction in psychological medicine. The candidate must be a registered medical practitioner, and subsequent to qualification have received instruction in anatomy and physiology of the brain and nervous system. The examination is divided into two parts, Part I dealing with anatomy, physiology, pathology, and bacteriology; Part II with psychology and experimental psychology, neurology and psychiatry. Candidates may present themselves for the whole examination or for either part separately. The course of training is very detailed, post-mortem technique being the subject of a series of sessions.

University of Leeds

The university grants a diploma in psychological medicine to graduates in medicine of at least one year's standing who have received systematic instruction on the normal and morbid anatomy of the brain, and have held an appointment in a mental hospital. The examination is divided into three parts: Part I deals with general psychology and the structural development and physiology of the nervous system; Part II with the pathology of that system; and Part III with clinical psychiatry, the administration of mental hospitals, and the medico-legal aspects of insanity. Candidates may present themselves for the three parts simultaneously or separately; they may submit a thesis or published work which, if approved, will gain certain exemptions

University of Manchester

The university grants a diploma in psychological medicine to graduates of at least one year's standing The examination is held in two parts. Before presenting themselves for Part I candidates must,

subsequent to qualification, have attended approved courses in the structure of the nervous system and in experimental psychology Before presenting themselves for Part II they must produce evidence of having gone through an approved course of instruction in the pathology of the nervous system and in clinical neurology, and of having attended demonstrations in psychological medicine, and received clinical instruction, either as residents or, in approved cases, as daily attendants, at an approved hospital for mental diseases The course extends over a period of three university terms, two of which must be taken in the university, and candidates may present themselves for both parts simultaneously or for each separately

University of Edinburgh

The course for the D P M extends over one term and is given from January to March Candidates are required subsequent to the date of graduation or obtaining a recognised qualification to have held (*a*) a resident appointment for one year in a hospital for mental disorders approved by the faculty of medicine, or alternatively (*b*) a six months appointment as defined in (*a*) and six months practical study of nervous diseases in a special or general hospital approved by the faculty There are two examinations for the diploma, both of which are held in March Part I comprises anatomy and physiology of the nervous system, psychology Part II comprises neuropathology, psychiatry and clinical psychiatry, clinical neurology Candidates who have held an asylum appointment for a period of five years or more may be exempted from the course of study in one or more subjects of the curriculum Alteration of certain sections of the regulations is at present under consideration Full particulars can be obtained from the dean of the faculty of medicine

University of Dublin (Trinity College)

The D P M is conferred upon registered medical practitioners who have held a resident medical appointment at a recognised institution for the treatment of mental diseases for 12 months, or who have held such an appointment for six months and have attended clinical instruction at an approved institution for six months Candidates must also attend special courses of instruction and pass a special examination Details can be obtained from the registrar of the school of physic, Trinity College, Dublin

National University of Ireland

The D P M may be conferred on registered medical practitioners who, although they may not have matriculated at the University, have completed the prescribed course of study A certificate of post graduate work will be required from the candidates, either in the study of mental disease or as medical assistant in an asylum Application should be made to the registrars of the constituent colleges, University College, Dublin, University College, Cork, and University College, Galway, for all information

English and Irish Conjoint Boards

Candidates for the diploma granted by these Boards must pass two examinations Part I consists of (*a*) anatomy and physiology of the nervous system, (*b*) psychology Part II consists of (*a*) neurology, including clinical and pathological neurology, (*b*) psychological medicine, including its legal relationship Further information in either case can be obtained from the secretary of the committee of management

RADIOLOGY

Faculty of Radiologists

The fellowship of the Faculty (F F R) is intended to meet the need for a higher radiological qualification and is obtainable by examination and submission of a thesis Candidates must be eligible for membership of the Faculty (i e, have practised radiology, or radiology and electrotherapeutics exclusively for at least three years), registered medical practitioners of at least five years' standing, and radiological diplomates of at least two years' standing After 1940 candidates will also be required to have spent at least a year in general clinical work at approved hospitals

The examination is held annually in London at the beginning of December The candidate must pass an examination on an honours standard in radio-diagnosis and/or radiotherapy, and on a pass standard in general medicine, general surgery and pathology, with special reference to diseases in which radiology is concerned A thesis on some special subdivision of the candidate's radiological subject is also required, and can be presented either before or after taking the examination

Candidates need not necessarily be members of the Faculty in order to sit for the fellowship examination, but an approved candidate must be elected as such before he can be admitted a fellow The examination fee is 10 guineas, and the fellowship fee for successful candidates 20 guineas

Further particulars may be obtained from the warden, Faculty of Radiologists, 32, Welbeck street, London, W 1

University of Cambridge

The teaching for this has hitherto been partly in Cambridge and partly in London, but it is likely that no further teaching will be undertaken in Cambridge and that the granting of the D M R L will cease in 1941 The course begins in October and lasts nine months The first four months are occupied with (*a*) lectures and practical work in physics, in preparation for the examination for Part I in February, (*b*) an introductory course of clinical instruction in radiology and electrology, (*c*) a course of instruction in pathology in relation to radiology and electrology The next three months are occupied with (*a*) lectures and demonstrations in radiology and electrology (including radium therapy) organised by the British Institute of Radiology, (*b*) clinical instruction in the radiological department of a hospital approved by the committee During the final two months of the course a candidate must hold a clinical clerkship or similar appointment in the radiological department of a hospital approved by the committee This part of the course may be done in London, or elsewhere The examination for Part II is held in July and October Further particulars as to courses and examinations may be obtained from the secretary for the diploma, Cavendish Laboratory, Cambridge

University of London

The course for the diploma extends over one academic year and is open to registered medical practitioners and graduates in medicine of this or any other approved University The subjects are Part I, physics and electrotechnology Part II (*a*) radiology and radio diagnosis, (*b*) radiotherapy. The examination is held in March and June (Part I), and in July and December (Part II) Particulars may be obtained from the academic registrar,

University of Liverpool

Candidates must possess a registrable qualification approved by the University in medicine and surgery, and must have attended courses of instruction in (*a*) physics (two terms), (*b*) (i) radiology, and (ii) electrology during nine months in the X ray and electrotherapeutic department of a hospital or hospitals. An examination is held in March and June (physics) and in June (radiology and electrology) Examination in either part may be taken separately. The courses commence during the first week in October. Application should be made to the dean, faculty of medicine, the University of Liverpool.

University of Edinburgh

The course of study for the D M.R covers an academic year (nine months) and commences in October. The number of candidates to be admitted to the course is limited, and early application for admission is essential. Candidates are not admitted to the examination for the diploma until after the lapse of not less than one year from obtaining a recognised qualification The examination, which is written, oral, and practical, is in two parts: (*a*) physics, and (*b*) radiology Full particulars may be obtained from the dean of the faculty of medicine.

English Conjoint Board

The examination for the D.M.R., R C.P. and S. comprises Part I, physics as applied to radiology and Part II, medical radiology, with special reference to its clinical application, including radio-diagnosis, X ray therapy, and radium therapy. Both examinations, which are written, oral, and practical, are held during January and July The course extends over one academic year of full-time study, subsequent to the attainment of a recognised qualification Before admission to Part I the candidate must have attended a course of instruction in physics as applied to radiology at a recognised medical school or institution for not less than three months Before admission to Part II he must have attended at a recognised hospital courses of instruction, theoretical and practical, in medical radiology, including radio-diagnosis, X ray therapy, and radium therapy, with clinical experience for three terms.

Candidates may enter for Parts I and II either together or separately, but no candidate is permitted to proceed to Part II until he has passed in Part I. The conditions regarding admission to examination may be modified in the case of a candidate (*a*) who has carried out original investigations in any subject of the examination, or (*b*) whose studies have extended over a prolonged period of time without fulfilling the exact conditions. Exemption will not be granted from any part of the examination.

TROPICAL MEDICINE

There are six main types of medical service in the tropics: the Indian Medical Service, the Colonial Medical Service, research under the Medical Research Council, independent private practice, subsidised private practice, and medical service with big commercial and industrial corporations A diploma in tropical medicine is regarded as almost indispensable for these appointments. Systematic instruction for such a diploma is given in the University of Edinburgh, at the Liverpool School of Tropical Medicine, and at the London School of Hygiene and Tropical Medicine, while the Universities of Edinburgh and Liverpool and the English Conjoint Board grant diplomas.

University of Liverpool

The Liverpool University diploma of tropical medicine (D.T.M.) is open only to those who possess a qualification to practise medicine recognised by the university, and who have been through a full course of instruction at the Liverpool School of Tropical Medicine. The subjects of examination are (*a*) tropical medicine and pathology; (*b*) bacteriology; (*c*) parasitology; and (*d*) entomology. The course consists entirely of practical and clinical work, given at the laboratory at the university, and at a recognised hospital in which beds are specially reserved for tropical diseases. Applications should be made to the dean of the medical faculty, University of Liverpool

The university also grants a diploma in tropical hygiene (D.T H) The subjects of examination are (*a*) tropical hygiene; (*b*) practical sanitation; (*c*) applied entomology, (*d*) sanitary engineering, (*e*) vital statistics and epidemiology; (*f*) meteorology and climatology, and (*g*) chemistry Accommodation for research work is to be had at the university laboratory.

University of Edinburgh

The course of instruction is given during the autumn and spring terms, October to March, and includes tropical hygiene, bacteriology, entomology, and parasitology, diseases of tropical climates (systematic and clinical), tuberculosis, and venereal diseases Provision is made in the University for instruction in all subjects. The examinations are written, oral, and practical, and are held at the end of the courses. Part I in December, and Part II in March. The University is included in the list of institutions in which courses of instruction in tropical medicine may be taken by officers on appointment to the Colonial Medical Services or during study-leave. Full particulars can be obtained from the dean of the faculty of medicine.

English Conjoint Board

The Board conducts an examination three times a year for the D T M. and H. granted by the Royal Colleges—namely, in February, July and October

The examination is written, oral, and practical, as follows:—

(*a*) Protozoology, helminthology, and bacteriology (including spirochætes), together with their associated pathology and entomology in relation to the ætiology, diagnosis, and prevention of tropical diseases, (*b*) examination of tissues, blood, and excretions for evidence of parasitic infection in relation to tropical diseases; (*c*) medicine and surgery and clinical pathology in relation to tropical diseases, (*d*) the special application of hygiene and sanitation to tropical conditions, international conventions relating to public health, administrative measures in relation to the prevention and control of diseases occurring in the tropics, the epidemiology of tropical diseases, vital statistics, and personal hygiene in the tropics

The examination is open to candidates possessing *either* a qualification in medicine, surgery, and midwifery which is registrable in the British Medical Register, *or* the medical and surgical degrees of an Indian, Colonial, or Foreign University recognised by the Examining Board in England.

The course of study extends over five months. The committee of management may modify the conditions of the regulations with regard to admission to the examination in the case of candidates (*a*) who have been engaged in medical work in tropical countries; (*b*) who produce evidence of having been engaged in original investigations in tropical medicine

or hygiene No exemption is granted from any subject of the examination Copies of the regulations and further particulars may be obtained, free of charge, from the Secretary, Examination Hall, Queen square, London, W C 1

GYNÆCOLOGY AND OBSTETRICS

Royal College of Obstetricians and Gynæcologists

For those practitioners who have had special post-graduate experience in obstetrics, but whose experience and work do not allow of their admission to the membership, the College grants a diploma (D R C O G) Candidates for it must be entered on the British Medical Register They must produce evidence of resident post graduate experience in obstetrics as well as in general medicine or surgery Evidence of having regularly attended at antenatal, postnatal, and infant welfare clinics, and of a satisfactory course in gynæcology are also required The D R C O G is intended to indicate that the holder is a competent obstetrician and one who may be regarded as sufficiently capable to act in the capacity of consultant to local authorities in midwifery practice The examination does not, however, include gynæcology except in so far as it is directly associated with childbearing and this diploma is not meant for those who aspire to hospital appointments with charge of gynæcological beds

University of Dublin

Candidates for the D G O must ordinarily hold a registrable qualification, those not so qualified must apply to the committee of the School of Physic for special permission to attend the course The course lasts nine months and consists of six months' study at Trinity College and six months' residence at the Rotunda Hospital usually done concurrently, followed by three months' study either at the Rotunda or at some other approved institution Practitioners who have been practising obstetrics and gynæcology for five years will be excused the final three months' hospital work The course at Trinity College is begun in October, or, in exceptional circumstances, in January or April The course at the Rotunda can be begun at any time The total instructional and examination fees amount to £60

OPHTHALMOLOGY

Special diplomas in ophthalmology are issued by two examining bodies

University of Oxford

The diploma in ophthalmology (D O) is granted to registered medical practitioners, and to non registrable graduates of universities approved by the board of the faculty of medicine, after they have passed an examination which is held annually in June This examination is open to candidates who have attended a special two months' course of instruction at Oxford, and who have in addition done a ten months' course of clinical ophthalmology at a recognised hospital, making at least twelve months in all Entries for the course should be made through the dean of the medical school the museum, Oxford from whom any further information may be obtained

English Conjoint Board

The Conjoint Board grants the D O M S after an examination held in two parts, twice yearly, in February and July Part I comprises anatomy and embryology of the visual apparatus, physiology of vision, and elementary optics Part II comprises optical defects, ophthalmic medicine and surgery, and pathology with special reference to ophthalmology The examination in each case is written, oral, and practical or clinical Candidates may only enter for Part II on completion of a year of special study of ophthalmology after obtaining a recognised qualification

LARYNGOLOGY AND OTOLOGY

English Conjoint Board

The Board grants the D L O after an examination held in two parts, in June and December Part I comprises anatomy, embryology, and physiology of the ear, nose, pharynx, larynx, trachea and bronchi, and œsophagus Part II comprises the medicine, surgery, and pathology of the ear, nose, pharynx, larynx, trachea and bronchi, and œsophagus, and the recognition and use of special instruments and appliances The examination in each case is written, oral, and practical or clinical Candidates may only enter for Part II on completion of one year of special study of the diseases of the ear, nose, pharynx, and larynx after obtaining a registrable qualification, or a degree in medicine and surgery of a university recognised by the Board

ANÆSTHETICS

English Conjoint Board

Examinations for the D A take place twice yearly, in May and November Subjects include history, theory, and practice of anæsthetics, pharmacology and elementary chemistry of anæsthetic drugs, pre- and post operative conditions relevant to anæsthesia A candidate must either have held a resident appointment in a recognised general hospital for twelve months, of which six shall have been as resident anæsthetist and six as house physician or house surgeon in the general wards, or he must have administered anæsthetics in a recognised general hospital on not less than one thousand occasions, at least one half of which shall have been for major surgical procedures These conditions may be modified for candidates who have carried out original investigations in the science or practice of anæsthetics or whose studies have extended over a long period without fulfilling the exact conditions

CHILD HEALTH

English Conjoint Board

Examinations for the D C H are held in March and October The examination (written, oral, and clinical) comprises the following subjects special emphasis being laid on their preventive aspects, (*a*) anatomy, physiology, and pathology of childhood, (*b*) development of the child, physical and mental including speech with its disorders, physical education in childhood, (*c*) hygiene and dietetics of infancy and childhood, (*d*) affections of the new born (*e*) disease in infancy and childhood medical and surgical, (*f*) therapeutics of infancy and childhood including remedial treatment physical and mental, (*g*) legislation and public administration in regard to the care of children including the methods of infant welfare centres and of the school medical service The candidate must have been in a recognised children's hospital or department as resident medical officer for six months or as clinical assistant for a year though these conditions may be modified in the case of candidates who

have carried out original research or whose studies and practice have extended over a long period. Forms of application may be obtained from the secretary, Examination Hall, 8, Queen-square, London, W.C.1.

TUBERCULOUS DISEASES

University of Wales

Candidates may be admitted to examination for the tuberculous diseases diploma (T D D) after the lapse of not less than two years from the date of obtaining a qualification in medicine, surgery, and midwifery, registrable in Great Britain or in the dominions, colonies, and dependencies of the British Empire, or a medical degree approved by the university. Every candidate must have held a resident post in a tuberculosis hospital, or at an orthopædic institution providing not less than 100 tuberculosis beds, or shall satisfy the faculty of medicine that he has pursued a special study of tuberculosis equivalent to the above for a period of not less than twelve months.

The examination is in two parts. Part I (*a*) written and (*b*) oral and practical, including the examination of patients, and the recognition of specimens; Part II is a written and practical examination on the epidemiology, pathology, and bacteriology of tuberculosis. Every candidate will be required to satisfy the examiners in both parts in the same examination. The course of instruction begins in January and continues until May each year, when the examinations are held. Further particulars may be obtained from the secretary, The Welsh National School of Medicine, The Parade, Cardiff.

A limited number of appointments for part-time assistant tuberculosis physicians are advertised annually in September by the Welsh National Memorial Association, enabling suitably qualified and selected candidates to study for the diploma. Particulars on application to the secretary, Welsh National Memorial Association, Memorial Offices, Westgate-street, Cardiff

As these classes have, in recent years, become very large, selection is necessary, and applications should reach the secretary by June 1 of each year.

BACTERIOLOGY

University of London

The course of study for the diploma extends over one academic year and is open to (*a*) graduates in medicine, science, and pharmacy of this or another approved University, whose previous training has, in the opinion of the University, fitted them to profit by the course; and (*b*) registered medical practitioners and other students who, though not graduates, have obtained a qualification and undergone a previous training which, in the opinion of the University, has fitted them to profit by the course.

A course necessary to fulfil the regulations of this diploma has been planned by the London School of Hygiene and Tropical Medicine, Keppel-street, London, W C., and full particulars with regard to the diploma may be obtained from the academic registrar, University of London, the Senate House, W.C.1.

University of Manchester

Candidates must (*a*) have graduated in medicine at Manchester or some other approved university, or (*b*) hold a registrable medical qualification, or (*c*) have obtained some other qualification approved by the senate. They must attend the prescribed course of study in the university. This lasts from October to June and is followed immediately by an examination Particulars may be obtained from the department of bacteriology, Public Health Laboratory, York-place, Manchester.

CLINICAL PATHOLOGY

University of London

The course of study for the D C P extends over one calendar year, and is open to graduates in medicine and to registered medical practitioners. The subjects are (1) morbid anatomy and histology; (2) bacteriology and serology, (3) biochemistry. The examination is held in October. Particulars may be obtained from the academic registrar, University of London, the Senate House, W.C.1. Particulars of the external diploma in clinical pathology may be obtained from the external registrar at the same address.

THE DEFENCE SERVICES

ROYAL NAVAL MEDICAL SERVICE

THE Royal Naval Medical Service offers a very satisfactory career to well-qualified medical men, with excellent opportunities for the practice of their profession and, if they wish, for specialisation. The pay is good and so is the prospect of promotion to higher rank with an adequate pension on retirement. Those who wish to enter the service must be British subjects of British parentage, must be registered medical practitioners and physically fit, and should be between 24 and 28. Additional seniority is given for resident hospital appointments held before joining, up to a maximum of one year.

Surgeon Lieutenants join on a short service basis for an initial period of three years, and their first appointment is to a four months' instruction course at the R.N. Hospital, Haslar, and the R.N. Barracks, Portsmouth. At the end of their second year they may apply to serve for a further two years, making five in all, and this application is seldom refused. Those who leave at three years receive a gratuity of £400. When an officer has reached about 3½ years' seniority he may apply for transfer to the permanent list. His chances of being accepted depend partly on merit and partly on the vacancies available. The chances at present are exceptionally good, for all suitable officers are being accepted. An officer who leaves the service after five years receives £1000 gratuity, and he receives the same sum less income-tax if he is accepted for the permanent list, but in that case he must undertake to serve for 25 years.

PROMOTION

Promotion to Surgeon Lieutenant-Commander is automatic at six years' seniority, provided an officer's service has been satisfactory and he has done two years at sea. During his time in this rank an officer undergoes a five months' course followed by an examination, in which 75 per cent. of marks qualifies for 12 months' special antedate of seniority and 85 per cent. for 18 months'. There is no specific penalty for failure. Officers are promoted to Surgeon Commander at 12 years' seniority, and it is thus possible for an officer who has obtained 12 months' seniority for resident appointments and 12 months' for reaching 75 per cent in the examination to become a Surgeon Commander after 10 years' actual service.

An officer becomes eligible for promotion to Surgeon Captain after 8 years as Surgeon Commander, but those selected have usually been from 11 to 13 years in that rank

The prospects of promotion to higher rank are difficult to estimate At present the total complement of medical officers is about 300 and this number includes 34 Surgeon Captains, 6 Surgeon Rear-Admirals, and 1 Surgeon Vice Admiral The proportion of officers on the permanent list who are eventually promoted to Surgeon Captain has been variously estimated at from 30 to 60 per cent

FOREIGN SERVICE

The proportion of appointments abroad to those at home is now about seven to five This means that junior officers, who must necessarily bear the brunt of foreign service in small ships, will spend the greater part of their time abroad This is attractive to many young men, and even for those who dislike it there is the compensation of foreign service leave which is 15 days for every six months abroad Many young officers returning from 2½ years in China find that the journey home has been sufficient holiday, and spend the bulk of their 2½ months at home doing post-graduate study.

SPECIALIST APPOINTMENTS AND POST GRADUATE COURSES

The policy of the Admiralty is to select specialists young and to keep them employed as specialists as continuously as possible if they are successful They are chosen on their professional experience, both before and after joining the Navy, their degrees and diplomas, and their capacity for team work, but no officer is made a specialist or given courses of instruction until it is certain that he is going to be appointed to the permanent list There are at present about 90 specialist appointments and it is necessary to have more specialists than this to allow for expansion, sickness, and so on

On the average it is intended that each officer shall have three courses of post graduate study during his 25 years' service in addition to the preliminary and promotion courses, but this cannot be guaranteed at present owing to the service being below strength By means of these many officers are enabled to obtain specialist diplomas or higher degrees

OTHER ALLOWANCES

Each officer accepted for service receives an equipment allowance of £50 towards the cost of uniform. Married officers over 30 years of age appointed on shore at home receive a removal allowance, and those employed on shore abroad receive free passages for their wives and families

The following allowances are also paid —

When in charge of hospitals and sick quarters	10*s* and 5*s* a day
Specialist allowance	5*s* a day
Senior medical officers in flag ships	5*s* and 1*s* 6*d* a day
Provision allowance when victualling is not provided	£47 a year

Gratuities —Officers permitted to withdraw instead of receiving a pension receive gratuities on the following scale —

Over 10 and under 15 years service	£500
" 15 " " 18 " "	£1000
" 18 years service	£2000

Widows' pensions —In the event of the death of an officer from any cause attributable to the service his widow and children are eligible for pension Pensions are also usually granted to the widows of officers of over ten years' service who die from other causes

Inquiries regarding the service, and applications for entry should be addressed to the Medical Director-General of the Navy, Admiralty, London, S W 1

FULL PAY, MARRIAGE ALLOWANCE, AND RETIRED PAY

—	Full pay of single officers and married officers under 30 [1]	Full pay of married officers over 30 [1]	Maximum pension for officers over 40	Retiring age
	£	£	£	
Surgeon Lieutenant on entry	438	522	408	45
After 3 years	478	562		
Surgeon Lieutenant-Commander on promotion	541	624		
After 3 years	575	657		
Surgeon Commander on promotion	706	788	543	55
After 3 years	773	855		
" 6 "	840	922		
" 9 "	906	989		
" 12 "	904	1046		
" 15 "	1022	1104		
Surgeon Captain on promotion	1037	1138	816	57
After 3 years	1119	1220		
" 6 "	1201	1302		
" 9 "	1284	1384		
Surgeon Rear Admiral	1734	1734	950	60
Surgeon Vice Admiral (Medical Director General of the Navy)	2263	2263	1022	On vacating office

[1] Lodging allowance at the rate of £80 per annum is payable when service accommodation is not provided As a general rule, lodging allowance will not be payable concurrently with marriage allowance

[2] Children's allowances are paid in addition at the following rates 2*s* a day for first child 1*s* a day for each subsequent child

Inquiries regarding the service, and applications for entry should be addressed to the Medical Director-General of the Navy, Admiralty, London, S W 1

Dental Branch

Candidates must be qualified dental surgeons and under 28 They must be medically fit for active service anywhere

Dental officers are appointed for short service (six years) in the first instance, but may be transferred to the permanent list at the discretion of the Admiralty On withdrawal at the termination of their short service engagement officers will receive a gratuity of £1000 An outfit allowance of £50 is payable on joining

Officers selected for the permanent list will normally be promoted to Surgeon Lieutenant-Commander (D) on transfer Promotions to Surgeon Commander (D) (establishment 15) and to Surgeon Captain (D) (establishment 4) are made by selection The present number of dental officers is 117

An antedate of seniority not exceeding six months may be allowed to officers who held suitable appointments in civil hospitals prior to entry into the service, such time counting for the purpose of (*a*) seniority, (*b*) increments of pay, and (*c*) promotion to the rank of Surgeon Lieutenant-Commander (D), but for no other purpose

Provision has been made for candidates who at the time of entry, hold, or who are about to hold an appointment as dental officer in a recognised civil hospital, to serve in such appointment provided the period of service *after entry* does not exceed six months The time will be allowed to count as indicated above, but pay is not allowed *during* the

period. It will count as service for the purposes of retired pay or gratuity on retirement or withdrawal, however, in the case of officers transferred to the permanent list.

Provision is made for post-graduate courses to dental officers after eight years' service.

The rates of full pay for dental officers are as follows:—

	£	£
Surgeon Lieutenant (D)	362–	447
Surgeon Lieutenant-Commander (D) ..	498–	623
Surgeon Commander (D)	666–	863
Surgeon Captain (D)	991–	1244

Marriage and children's allowances, also other allowances—e.g., removal allowances—are paid to naval dental officers under the same conditions as for other naval officers

Further particulars, including rates of full pay and allowances, retired pay and withdrawal gratuities, can be obtained by application to the Medical Director-General of the Navy, Admiralty, S.W.1.

ARMY MEDICAL SERVICES

Royal Army Medical Corps

Officers are appointed to the Royal Army Medical Corps in the first instance for a period of five years During his fourth year of service an officer can apply for a permanent commission in the Royal Army Medical Corps or the Indian Medical Service Those not granted a permanent commission retire on completion of five years' service with a gratuity of £1000, and are liable to be called up for duty in the event of a national emergency arising during the 12 years following their retirement This gratuity should go a long way towards enabling an officer to establish himself in civil life

New entrants are commissioned in the rank of Lieutenant, and the first three months of their service are on probation, during which time they undergo a course at the Royal Army Medical College in London, in hygiene, tropical medicine, entomology, &c., in addition to their military training at the R A.M C depôt at Aldershot A grant of £50 is made towards the purchase of uniform.

A candidate for a commission in the R A M C who is holding or who is about to hold an approved whole-time appointment at a recognised civil hospital may be granted a commission and seconded while holding his hospital appointment up to a maximum period of 12 months. While so seconded he continues to hold his commission in the R A M C but does not receive army pay and allowances. The period of secondment, however, counts as army service as explained below. A candidate who has held an approved whole-time hospital appointment within six months of entry may be granted an antedate not exceeding 12 months in respect of the period the appointment was held. The period of secondment or antedate does not reckon as part of the five years which he is required to serve on a short service commission, but does count for seniority.

PROMOTION

An officer is promoted to Captain after one year's commissioned service on full pay. If appointed to a permanent commission he is promoted to Major on completion of 10 years' commissioned service, including the period of any antedate granted. Promotion to the ranks of Lieutenant-Colonel and Colonel is by selection to fill vacancies within the establishment, which is designed to allow promotion to those ranks on the average after 17 and 25 years' service respectively.

PROFESSIONAL OPPORTUNITY

The possibilities for good work are very great. There is scope for original research in tropical diseases, in preventive medicine, and in bacteriology, as well as in the large clinical field open to the specialist in medicine, surgery, gynæcology, diseases of the ear, nose, and throat, ophthalmology, and venereal diseases. Child welfare is also undertaken systematically by officers of the R A M.C. Young officers having special qualifications or experience in particular branches can, if found sufficiently expert, be graded as "physician," "surgeon," "otologist," "gynæcologist," "ophthalmologist," &c They are then eligible to fill specialist appointments with additional pay.

FOREIGN SERVICE

The tour of foreign service in India, Burma, and Egypt is five years, in Gibraltar and Malta four years, and in other stations three years, but arrangements are made for officers retiring on a gratuity after five years' service to return to England at public expense by the end of that period.

POST-GRADUATE STUDY

Between his sixth and tenth year of service an officer undergoes a course of post-graduate study at the Royal Army Medical College and the London hospitals of five months' duration, followed by a course of study of a special subject, selected by himself, provided he has shown special aptitude in the post-graduate course or during his previous service. During this course of study he remains on full pay, and the fees for the course are paid by the State.

When qualified in his special subject, the officer up to and including the rank of Lieutenant-Colonel becomes entitled to specialist pay at 4*s* 6*d* per day when holding a specialist appointment

PAY AND ALLOWANCES (HOME RATES)

The rates of pay and allowances for officers are at present as shown in the Table, but the allowance rates vary slightly from time to time An officer below the substantive rank of Colonel holding an appointment as specialist receives 4*s* 6*d*. a day, in addition to his ordinary pay.

CHARGE PAY

	Daily. s	d
(*a*) An officer below the substantive rank of Colonel in charge of a hospital of 50 beds and over, or in charge of a medical or surgical division of a general hospital with at least 300 beds .	5	0
(*b*) Senior Medical Officer, Royal Arsenal ..	5	0

Assistant professors at the Royal Army Medical College (Lieutenant-Colonels) receive pay and allowances of their rank plus £90 10*s*. a year.

RETIREMENT AND RETIRED PAY: OFFICERS HOLDING PERMANENT COMMISSIONS

The following are the rates of retired pay:—

1. For officers below the rank of major-general retired pay consists of two parts. (*a*) a service element based on the officer's total service, (*b*) a rank element for the rank from which the officer retires.

2 The scale will be as follows:—

(*a*) Service element: £13 11*s* 6*d*. for each completed year of service as a medical officer.

Major	407 5 0	Major General	950 0 0
Lieutenant-Colonel	543 0 0	Lieutenant General	1120 0 0
Colonel	724 0 0		

The retired pay of an officer retiring with less than one complete year's service in the rank from which he retires will be assessed as though he had retired from the rank below

3 An officer with less than 20 complete years' service will not be eligible to retire voluntarily on service retired pay

4 Officers may be permitted to retire with a gratuity in accordance with the following scale :—

With 5 and less than 10 years service as a medical officer	£1000
After 10 years' service as a medical officer	£1600
" 15 " " " "	£2800
" 18 " " " "	£3500

Normal entry takes place twice yearly at the beginning of May and November Interim entries are arranged for February and September

Regulations for admission giving full details and application forms, should be obtained from the Assistant Director General Army Medical Services (A M D 1) The War Office Whitehall, London, S W 1

The Army Dental Corps

This Corps is administered by the Dirs tor General, Army Medical Services who is assisted by the Director Army Dental Service

APPOINTMENT AND PROMOTION

The appointment of officers to the Army Dental Corps is, in the first instance by means of a short service commission for a period of six years In the fifth year an officer is given the opportunity of applying for a permanent commission Those not desirous of a permanent commission, or not selected, retire on completion of six years' service with a gratuity of £1000 They are liable to be called up for duty in the event of a national emergency during the 12 years following their retirement

New entrants, who must be duly qualified under regulations approved by the Army Council, are commissioned in the rank of Lieutenant

A candidate for a commission in the Corps who is holding or who is about to hold an approved whole time appointment in a recognised civil hospital may be granted a commission and seconded while holding his hospital appointment for a period not exceeding six months While so seconded he will continue to hold his commission in the Corps, but will not receive army pay or allowances The period of secondment will, however, count as army service as stated below A candidate who has held an approved whole time appointment in a recognised civil dental hospital or in the dental department of a recognised civil general hospital may be granted an antedate covering the period of his appointment, but not exceeding six months, provided that the interval between the termination of the hospital appointment and the date of entry into the Service does not ordinarily exceed six months The period of secondment or antedate in respect of a hospital appointment will not reckon as part of the six years which he is required to serve on a short service commission, but on completing one year of actual service in the Army Dental Corps it will count for seniority It will also count for increment of pay dependent upon length of service and after appointment to a permanent commission, for promotion to the rank of Major, and towards retirement on retired pay or with gratuity

An officer is eligible for promotion to Captain after one year's service and to Major after ten years' service in the Corps, provided he has qualified in such manner as may be prescribed by the Army Council Promotion to the ranks of Lieutenant Colonel and Colonel is made by selection from those senior in the rank below

PAY AND ALLOWANCES

The rates of pay are slightly less than those of the Royal Army Medical Corps, the difference varying from 1s 8d in the rank of Lieutenant to 2s 2d in

the rank of Colonel. Allowances are at the same rates as for officers of the Royal Army Medical Corps.

RETIREMENT AND RETIRED PAY OR GRATUITY

The rates of retired pay are the same as for officers of the Royal Army Medical Corps. Voluntary retirement on retired pay is not allowed until after 20 years' service

Earlier retirement on gratuity may be allowed:—

After 6 years'	service as a Dental Officer,	gratuity of £1000
" 10 "		" £1350
" 15 "		" £2250
" 18 "		" £3000

The aim of the Corps is the prevention of wastage on account of dental disease or dental deficiency, and, to enable this to be carried out, every recruit is inspected by a dental officer immediately after joining and all necessary treatment carried out. The soldier is reinspected at least once a year and the dental efficiency maintained at the best standard possible.

The regulations for admission to the Corps may be obtained from the Under-Secretary of State, War Office, London, S W.1.

MEDICAL BRANCH OF THE ROYAL AIR FORCE

The Air Council attach great importance to attracting into the Service the best type of medical man since on the capacity of the Medical Branch depends in a peculiar degree the safety and efficiency of the Air Force The duties of a medical officer in the Air Force include not only the prevention and treatment of those ordinary diseases to which the personnel of any fighting service are liable, but the special study of the mental and physical stresses imposed on the airman in diverse circumstances and climates—a new branch of medicine which still provides considerable scope for research.

With the Air Force now increasing enormously the prospects offered for the study of the special medical aspects of aviation are greatly enhanced, and there are many more opportunities for gaining experience and for employment in specialist and general medical work and in administrative posts

The work has a high professional interest combined with good rates of pay and allowances and the life is certain to appeal to the man of wide outlook who desires opportunities for travel, sport, and games, and can find interest and enjoyment in aviation. His duties will give him flying experience as a passenger, which is necessary for the proper study of the medical problems of aviation and for gaining first-hand knowledge of the conditions under which his comrades serve He may also, if he wishes, learn to fly, when this can be arranged without interference with his duties

The establishment consists partly of permanent and partly of short service officers, and an officer on entry is granted a short service commission for a period of three years on the active list (which may be extended to five years) and of four years in the Reserve of Air Force Officers. Selections for permanent commissions are made from officers holding short service commissions who are considered to be suitable and who desire a life career in the Service. Those who are not selected are transferred to the Reserve at the expiration of their period of service on the active list.

But the short service commission with its gratuity after three or five years is in itself an attraction to many entrants who desire to enlarge their experience and outlook from the point of view of subsequently entering private practice, and who, on entry, have not made up their minds to the adoption of a permanent career in the Service.

For certain purposes medical officers are allowed to count as service their time spent in approved whole-time post-graduate appointments in civil hospitals under certain well-defined and generous conditions.

After about five years' service all permanent officers who are judged suitable are given the opportunity to take a course of specialist study towards the expense of which an allowance is made Their subsequent career is normally as follows. Approximately three-quarters of the employment of squadron leaders and senior flight lieutenants is in specialist posts, though these are not generally of a full-time specialist character. On reaching the rank of wing commander, the policy is to allow a proportion of officers to become permanent specialists and to be employed continuously throughout the remainder of their career in full-time specialist posts In addition there are a number of hygiene posts in the rank of wing commander open to specialists in that subject thus further increasing the proportion of specialist posts open to officers. In the rank of group captain, apart from the posts already mentioned as available for the permanent specialist, employment is nearly equally divided between posts in charge of a large hospital and headquarter administrative posts. This statement indicates the position as regards specialist employment as at present foreseen.

New entrants into the Royal Air Force Medical Branch are commissioned as Flying Officers (Medical), and are eligible for promotion to the rank of Flight Lieutenant (Medical) after one year's service on full pay Accelerated promotion to the rank of Squadron Leader may be granted at any time after the completion of eight years' service to officers qualified to hold specialist appointments; those officers who are not so qualified are eligible for promotion to this rank after ten years' total service Promotion within establishment to the ranks of Wing Commander and above is by selection The number of permanent commissions granted yearly is regulated with a view to all suitable permanent officers being promoted to Wing Commanders and of a substantial proportion of Wing Commanders being promoted to Group Captains

There is no competitive examination on entry; candidates, who must be under 28,[1] are interviewed by a board presided over by the Director of Medical Services, Royal Air Force, before acceptance. Each candidate must produce:—

1. Birth certificate 2. Medical registration certificate 3. A declaration containing the following information: (*a*) Age and place of birth (*b*) That he is a British subject, the son of British subjects, and of pure European descent (*c*) That he is ready to engage for general service at home or abroad as required. (*d*) The qualifications he is possessed of, and what medical or other appointments he has held (if any). (*e*) That he is willing to fly as a passenger whenever called upon to do so

Each candidate is required, before acceptance, to pass a medical examination On appointment entrants undergo a course not exceeding three months during which they are given instruction in the special medical aspects of aviation, hygiene, and tropical medicine, the organisation and administration of the Royal Air Force, and the general and special duties to be performed by officers in the Medical Branch.

[1] As a temporary measure applications will be received from candidates up to the age of 31.

EMOLUMENTS

The emoluments of medical officers of the Royal Air Force are given in outline below The rates of pay

Rank	Pay (per annum)	Allowances (per annum) (present home rates)	
		Married	Single
	£	£	£
Flying Officer	394	198	125
Flight Lieutenant	429	237	125
Ditto, after 2 years as such	462	237	125
Ditto, „ 4 „ „	496	237	125
Squadron Leader	644	240	164
Ditto after 2 years as such	709	240	164
Ditto, „ 4 „ „	742	240	164
Ditto „ 6 „ „	809	240	164
Wing Commander	909	240	193
Ditto, after 2 years as such	943	240	193
Ditto, „ 4 „ „	1046	240	193
Group Captain	1166	313	254
Air Commodore	1320	370	315
Air Vice Marshal	1652	433	376

Special allowances are applicable at stations abroad

are fixed on an inclusive basis, and the fact that specialist pay and charge pay are not payable as separate emoluments was taken into account when the rates were fixed

In addition to pay, officers receive quarters (with fuel and light), rations, and attendance, or, if these are not available in kind, they are given cash allowances in lieu as shown in the Table The rates and general scheme of allowances are subject to review as circumstances may require Married officers over 30 receive either married quarters or allowances at the married rates

UNIFORM AND EQUIPMENT

An allowance of £50 towards the cost of uniform is made on joining to candidates who have not had previous commissioned service in H M Forces

LEAVE

Subject to the exigencies of the Service, officers at home are allowed ordinary leave up to sixty one days in a year, officers abroad may accumulate leave up to 91 days, which may be taken on return home Full pay is granted for ordinary and accumulated leave

DISABILITY AWARDS, WIDOWS' PENSIONS, &C

Permanent medical officers invalided from the Royal Air Force are eligible for retired pay or gratuity however short their service may have been If their disability is attributable to the conditions of their service and is assessed at 20 per cent or more, they receive an additional payment, varying according to the degree of disablement Provision is also made in the regulations for pension to the widow and allowances to children or dependants of a deceased officer

RETIRED PAY

The minimum period of service qualifying for retirement on retired pay is 20 years The maximum rates of retired pay and the compulsory retiring ages for the several ranks are —

Rank	Yearly rate of retired pay	Compulsory retiring age
	£ s	
Air Vice Marshal	1,050 0	60
Air Commodore	800 0	59
Group Captain	614 10	57
Wing Commander	513 0	55
Squadron Leader	452 10	55

Gratuities —A permanent officer allowed to retire before having qualified for retired pay may be granted a gratuity, namely —

£1000 if he has 5 but less than 10 years commissioned service
£1500 „ „ 10 „ „ 15 „ „ „
£2800 „ „ 15 or more than 15 „ „ „

Short service officers who complete their full period of service on the active list will normally be granted gratuity as follows on transfer to the Reserve —

After 3 completed years	£100
„ 5 „ „	£1000

These gratuities will not be payable to officers granted permanent commissions, but their service on a short service commission will count towards retired pay

GENERAL

The pay of officers even in the lowest rank is ample to enable them to be independent and the expenses of Air Force messes are strictly limited, in order to check all tendency to extravagance and to prevent even the most junior officer from finding difficulty in living on his pay The regulated limit of the daily rate of messing is 5s and the average rate at present charged at home stations is 3s 6d Subscriptions and the cost of mess entertainments are charged according to an officer's rate of pay, and an unmarried officer taking his full share in the life of the mess should not incur a mess bill of more than £10 a month (6s 8d a day) This sum would include a wine bill of £1 a month (an actual average figure) but would not include goods, such as tobacco, bought through the mess Further information may be obtained from the Under Secretary of State, Air Ministry (D M S) Adastral House, Kingsway, London, W C 2

HEALTH SERVICES AT HOME

PUBLIC HEALTH

The public health service in this country dates from 1847 when the first medical officer of health was appointed Such appointments became generally compulsory in 1872, and during the present century the service has grown so rapidly that it now includes not only medical officers of health, but also officers for tuberculosis, for venereal disease, for maternity and child welfare, and for school medical work, as well as a large number of assistants of various grades Any young medical man or woman desirous of entering the public health service should first of all obtain resident appointments in general and in special hospitals such as those for children's diseases or infectious diseases before proceeding to the course of study for a diploma in public health

No medical officer of health may be appointed unless he is the holder of a registered diploma in public health or its equivalent His appointment must receive the sanction of the Minister of Health and cannot be terminated without the consent of the Minister The course of training required for the diploma in public health and the scope of the examinations are controlled by rules of the General Medical Council and the Minister of Health has made regulations prescribing the experience required of persons applying for any of the following specialist appointments tuberculosis officer or sanatorium superintendent venereal disease pathologist venereal disease officer, senior maternity and child welfare medical officer and medical officer of an antenatal clinic Vacancies as they occur are advertised in the medical journals and all these appointments are

pensionable and carry salaries in accordance with a scale embodied in an agreement between the British Medical Association and the associations of local authorities known as the Askwith Memorandum. This lays down minimum commencing salaries for medical officers of health on a population basis (the lowest figure being £800); a scale of salaries for senior medical officers (those responsible for the work of a department under the M.O.H.) rising from £750 to 25 per cent. or more above that commencing figure; a scale for assistant medical officers in departments of £500 rising by annual increments of £25 to £700; and a scale for resident medical officers in hospitals of £350, rising by £25 to £450, together with board, lodging, laundry, and attendance—emoluments which are generally held to be equivalent to £150 per annum.

The present whole-time personnel of the public health service (including officers holding appointments in tuberculosis and infectious diseases, but not general, hospitals) in England and Wales is about 1800. Of these about 450 are medical officers of health, with salaries ranging from £800 to £2000 or more in the case of a few of the larger authorities. Next come some 300 appointments on the senior medical officer scale (£750 rising to £940 or more), including those of deputy or senior assistant medical officers of health, senior tuberculosis officers, senior assistants for school medical or maternity and child welfare work, and medical superintendents of isolation hospitals and sanatoria. There is also an intermediate class of some 350 assistant medical officers whose salaries rise to maxima between £750 and £900. Lastly there are about 650 to 700 junior assistant medical officers and resident medical officers of isolation hospitals and sanatoria; it is known that some 200 of these now receive a commencing salary of £600 or more instead of the £500 laid down in the Askwith Memorandum.

Thus it will be seen that the prospects of becoming at least a senior medical officer are not unpromising for a competent man or woman who enters the public health service, and those whose bent is clinical rather than administrative will find plenty of scope in the variety of public health medical services controlled by local authorities.

London School of Hygiene and Tropical Medicine

The course for the University diploma in public health will begin at Keppel-street on Sept. 25th. The inclusive fee is fifty-four guineas. Full-time attendance is compulsory under the revised rules of the General Medical Council for Part I of the course which lasts from September to December. Part II of the course for full-time students lasts from January to June. Arrangements have been made for a limited number of candidates selected for certain appointments in the L.C.C.'s special hospitals to attend as part-time students for the second part of the course. In their case part-time instruction will be given from January to the following December. With the exception of this group all students are expected to devote their whole time to the course.

The curriculum has been planned on very practical lines and, in addition to work with medical officers of health in selected areas and the necessary instruction in infectious disease and hospital management, it includes a large number of visits to places of public health interest. Lectures are given by authorities on special subjects, and these are open to members of the medical profession generally as well as to students of the School. During the academic year a course on mental deficiency is provided which members of the public health class may attend. It is designed to enable qualified medical practitioners to secure recognition by the Board of Education as certifying officers, so far as elementary school-children are concerned, under the Mental Deficiency Acts.

Royal Institute of Public Health and Hygiene

Facilities are offered at 23, Queen-square, London, W.C.1, for students training for the D.P.H. Candidates holding appointments are admitted to the Part 2 course as part-time students. There are well-equipped laboratories where practical instruction is given in chemistry, bacteriology, immunology, and public health subjects, and analyses are undertaken, both chemical and bacteriological, of milk, water, and sewage effluents, providing excellent teaching material. Particulars may be obtained from the secretary at 28, Portland-place, W.1.

L.C.C. HOSPITALS

THE hospital service of the London County Council provides opportunities for valuable experience for medical graduates who intend to be general practitioners or consultants, as well as for those who intend to make the public health service their career. The L.C.C. is responsible for the management of 76 hospitals (excluding mental hospitals)—namely, 28 general hospitals (including 1 for children), 12 special hospitals for the chronic sick, 2 convalescent hospitals for general cases, 2 hospitals for sane epileptics, 16 fever and other hospitals for infectious diseases, 9 tuberculosis hospitals (including 3 for children), 5 special hospitals and convalescent homes for children, 1 hospital for the treatment of ophthalmia neonatorum and vulvo-vaginitis in children, and 1 for the treatment of venereal disease.

Medical superintendents of the hospitals, who are expected to be experienced hospital administrators, receive £850–£1650 a year, corresponding to hospitals varying in accommodation from 160 to 1300 patients. In addition, medical superintendents are provided with an unfurnished house or quarters, with payment by the Council of local and water rates.

The subordinate staff is classified thus:

Grade	Scale of annual salary
Deputy medical superintendent, class I	£650–£50–£800
Deputy medical superintendent, class II	£600–£30–£750
Deputy medical superintendent, class III	£550–£25–£650
Deputy medical superintendent, class IV	£500–£25–£600
Senior resident surgeon, physician or obstetrician, and senior assistant medical officer	£500–£25–£600
Assistant medical officer, class I	£150–£25–£125 rising to £450 if placed on promotion list
Assistant medical officer, class II	£250 (fixed)

In addition, all these officers are provided with board, lodging, and washing. All the positions mentioned involve full-time duties, and it is a condition of service that such officers shall not undertake any other paid employment without special authority. The staffing provides, where necessary, for house physicians or house surgeons, paid at the rate of £120 a year with residence, and for clinical assistants, who are non-resident and receive £150 a year with meals when on duty. These officers are not employed in a whole-time capacity and are granted adequate leisure for study.

A number of positions of assistant medical officer classes I and II in the infectious hospitals are filled by a new grade of junior assistant medical officer, recruited from medical practitioners taking part II of the diploma of public health at the London School of Hygiene and Tropical Medicine.

Deputy medical superintendents who occupy unfurnished houses or quarters (married quarters) free of charge and rate free in the hospitals, are paid £50 a year in addition to the salary scales set out above

Vacancies in the higher grades are filled, as far as possible, by promotion from the existing staff For subordinate staff, the extent and fluidity of the hospital service provides unique opportunities for a variety of experience, and facilities exist for specialisation and for officers to follow courses of study outside the service with a view to improving their professional qualifications

During the past year 177 vacancies have been filled, including 1 position as medical superintendent, 1 as deputy medical superintendent, 9 as senior assistant medical officers, 103 as assistant medical officers, and 63 as house surgeons, house physicians, or clinical assistants In addition, a large number —more than 200—of part-time consultants and specialists are employed in the various hospitals These appointments, which vary from 1 to 8 sessions a week, include physicians, surgeons obstetricians and gynæcologists, anæsthetists pædiatrists, neurologists, neuro surgeons, orthopædists, radiologists, dermatologists, ophthalmologists urologists and ear, nose, and throat specialists Other part time consultants and specialists are employed for special purposes—e.g., venereal diseases specialists and plastic and thoracic surgeons—and the services of a tuberculosis officer are available at each general hospital having a tuberculosis ward There are 7 part time obstetricians and gynæcologists employed at certain of the council's general hospitals The salary attached to these positions is £800 a year if the appointment covers two hospitals with large maternity departments, and £600 a year if it covers one such hospital These officers, who devote the equivalent of half their time to the work of the maternity units visit each of the hospitals to which they are attached daily (including Sundays if necessary) and as required Subject to the administrative supervision and control of the medical superintendents they are responsible for the whole of the obstetric and gynæcological work of the hospitals to which they are attached

In addition to the director of the radiological department of Hammersmith Hospital and consulting radiologist to the Council's hospitals and the assistant radiologist at that hospital three full time radiologists are employed at groups of hospitals A full time surgeon specialist in radiotherapy is employed at Lambeth Hospital, another for fracture cases at Lewisham and St James Hospitals, and a cardiologist to cover all the council's hospitals The salaries of these range from £1250 to £1500 a year

A comprehensive pathological service has been established There are seven group laboratories, each of which serves a number of hospitals, a central histological laboratory and a serum institute, whilst attached to each of the group laboratories are the subsidiary laboratories situated in the various hospitals A total staff of 27 is attached to these laboratories and apart from supervision or actual performance of laboratory work they act as consultants in pathology, morbid histology, and the like

PRISONS

Whole-time appointments—At the larger prisons the medical officerships are full time appointments, and at certain establishments deputy medical officers are appointed to assist in the work Whole-time medical officers are in two classes medical officers, class II, £525 a year proceeding by annual increments of £25 to £800 a year (the commencing salary for those holding the diploma of psychological medicine being £575 per annum), medical officers, class I, £800 a year proceeding by annual increments of £30 to £1000 a year Unfurnished quarters are provided or an allowance in lieu is made The posts are pensionable The initial appointment is to the class II grade with prospects of promotion to the higher rank Of the whole time Prison Medical Service 17 are class II and 12 are class I Promotions from class II to the rank of medical officer, class I, are made as vacancies occur Three of the senior medical officers receive an additional allowance of £50 per annum, and at certain prisons, medical officers receive fees for giving evidence in the criminal courts Candidates must be fully qualified and registered Preference is given to those who have held house appointments, have had experience in mental diseases and psychological methods, and are between the ages of 25 and 35 years

Part time appointments—The medical officerships of the smaller prisons, where the work is insufficient to occupy a man's whole time, are usually filled by local practitioners, who combine the prison work with their own practice The salary paid for such part time work varies according to the extent of the duties required Such appointments may be terminated with notice at any time, and the holders are not entitled to pension

Further particulars can be obtained from the Secretary (Staff Branch) Prison Commission, 62/64, Baker street London W 1

SERVICES ABROAD

INDIAN MEDICAL SERVICE

FUI OI EAN OFFICERS

ADMISSION to the Service is by selection and nomination by the Secretary of State for India Candidates should be under 32 years of age and must possess a registrable qualification The Service is designed primarily to meet the needs of the Indian Army, but in order to maintain the necessary minimum war reserve of military medical officers, and to provide for European medical attendance for European officers of the superior civil services and their families provincial governments are required to employ a stated number of Indian Medical Service officers Certain posts under the Government of India are also reserved for members of the Service It is a definite condition of service that officers are liable to serve on either the civil or the military side On first appointment an officer is required to serve for a period in the military branch and will not normally be considered for appointment to the civil branch until he has done two years service, including at least one year in India. Executive medical officers in both civil and military employment may attend persons unconnected with Government service provided their duty admits of it On the military side, however, the opportunities for private practice are not great The commissions of officers who before appointment have obtained certain higher medical qualifications or have held approved whole time appointments in a recognised civil hospital may be antedated in either case by one year or on the two counts combined by not more than 18 months

PROSPECTS

During the past few years the prospects of the I.M.S. have become brighter, and those in touch with the realities of the situation are of opinion that its attractions are now as great as ever. There is ample scope for men who have specialised in medicine, surgery, and midwifery, and for those with an aptitude for research. The chief attraction perhaps is the variety of careers which the Service offers Pay and pensions are good and although junior officers who are married must expect to live quietly if they are to avoid exceeding their incomes, they have a great advantage over private practitioners in that they are automatically saving considerable sums of money in the shape of provision for a pension on retirement.

After an exhaustive investigation it has been decided that the civil side of the I.M.S. must be retained for the purpose of providing a war reserve. It has also been ruled that a number of specialist and other civil appointments are to be reserved for European officers of the Service. These appointments include 31 specialist posts under provincial governments, and 84 civil surgeoncies and other posts under the central government, the crown representative, and provincial governments There are 24 further posts open to Indian and European officers, including 12 medical research appointments. Highly qualified men have therefore a good chance of securing congenial civil appointments after a varying period of military service.

Those who enter the Service at an early age have an advantage over those who delay till several years after qualification. The ideal course is to enter after spending a year in a resident hospital appointment, for the candidate can then usually enter the Service with the rank and pay of a captain.

A point often overlooked by young doctors is that the I.M.S. offers permanent commissions to European candidates, so that recruits can look forward with confidence to a settled career instead of experiencing the doubts and anxieties associated with temporary commissions. The Service also offers all the advantages of the short-service system: a European officer can retire after six years with a gratuity of £1000, or after twelve years' service with one of £2500. But although many men have joined up with the intention of taking the gratuity, very few have actually done so; it is reasonable to infer that the conditions of service prove attractive to the great majority of entrants. Despite the changes which have been constantly occurring throughout the history of the Service, there has never been a time when men of ability and enterprise have been unable to carve out distinguished careers for themselves Whatever changes the future may bring, the time is remote when there will cease to be a demand for the best class of European doctor in India No other Service offers such a combination of financial security and varied professional opportunity. There is little need to fear the risks to life and health in India; the death-rate among British troops which was 13 per thousand in 1900 is now less than 2 5 per thousand. The distance of India is being diminished in a corresponding degree; it will soon be possible to travel from Karachi to London in less than three days. Those who are interested in the Indian Medical Service should consult one of its junior members; retired officers are now as ever prone to emphasise the goodness of the old days

Recruitment during the past few years has been highly satisfactory both in number and quality of the accepted candidates, so that a very small number of vacancies now exists. Only men of exceptional attainments are likely to be successful in their applications for commissions, and, although the age limit is still 32 years, preference will probably be given to candidates who are under 28

RATES OF PAY

The monthly rates of pay for European officers of non-Asiatic domicile in the Service are as tabulated below. The rupee is worth about 1s. 6d, and rupees per month may easily be converted into pounds per annum by multiplying by nine-tenths

Year of service	Rank	Basic pay, Rs per month	Overseas pay, £ per month	Total, £ per annum
1	Lieutenant	450	15	585
2	Captain	500	25	750
3–4	"	550	25	795
5	"	600	25	840
6	"	600	30	900
7–8	"	700	30	990
9–10	"	700	35	1050
11	Major	800	35	1140
12–15	"	800	40	1200
16–18	"	950	40	1335
19–20	"	1100	40	1470
21–23	Lieutenant-Colonel	1350	40	1695
24–25	"	1500	40	1830

Officers on appointment receive an outfit allowance of £75 Officers in command or second-in-command of the larger station hospitals, receive special allowances On the civil side there are public health, bacteriological, research, and professional appointments carrying special enhanced rates.

Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service. The appointment of Director-General, I.M S, for instance, carries pay of Rs 3500 a month

PENSIONS AND ALLOWANCES

The rates of pensions are as follows:—

Service	Rates per annum	Service	Rates per annum
After 17 years ..	£372	After 23 years ..	£576/10/-
" 18 " ..	400	" 24 " ..	614
" 19 " ..	428	" 25 " ..	651
" 20 " ..	465	" 26 " ..	697/10/-
" 21 "	502	" 27 " ..	744
" 22 "	539/10/-		

There are additional pensions ranging from £65 to £350 per annum for officers who have held high administrative appointments

Officers on appointment are provided with free passage to India, normally by transport The wives and families of officers who are married before embarkation on their first appointment will also be given free passage to India subject to the payment of messing charges Officers are granted a certain number of return passages home for themselves, their wives and children at Government expense during their career. There are special allowances for officers whilst on study leave

Further particulars can be obtained on application to the secretary, Military Department, India Office, Whitehall, London, S.W.1. Letters should be marked "Recruitment for I.M S."

WOMEN'S MEDICAL SERVICE FOR INDIA

Among careers open to medical women abroad the Women's Medical Service for India deserves honourable mention. Admission is made by selection in India and England, preference being given to those with Indian experience. The Service is open to fully qualified medical women of British or Indian nationality, and with the present amount of Govern-

ment subsidy the number of full medical officers is limited to 44 There are six to ten temporary officers, and in addition there is a training reserve of about fourteen recently qualified women holding degrees in medicine of Indian universities Medical women proceeding to India to join the Women's Medical Service receive a sufficient sum for a first-class passage to India On landing they are posted to one of the larger women's hospitals to gain Indian experience and to learn the language For a further period they are appointed to act temporarily for medical women on furlough They are then definitely appointed to the charge of hospitals Private practice is allowed, provided it does not interfere with official duties The only exception is in administrative or educational posts, when an allowance in lieu of practice is given The amount obtained from practice varies according to the station, but in most cases it forms a fair addition to the salary, varying from £150 to £1000 a year

Excellent opportunities for surgery, gynæcology, and midwifery are found in the Women's Medical Service Opportunities are likely to open in the future in connexion with maternity and child welfare Doctors in charge of hospitals have ample scope for administration and their duties always include some teaching of Indian nurses and dispensers, as well as training young medical women as house surgeons and physicians Teaching posts at Medical Colleges and Schools for Women form about one third of the total sanctioned posts in the Service

The cost of living in India is much higher than formerly, but it should be possible for a medical woman (with house provided) to meet actual household expenses on about Rs 350 a month, leaving the remainder of her salary for dress and personal expenses To this must be added the necessary saving to meet additional expense for furlough and leave spent in the hills Rates of pay range from Rs 450 a month with Rs 100 a month overseas allowance to Rs 850 with Rs 150 a month overseas allowance

Furnished quarters are provided, representing an additional Rs 150 a month or an allowance is given instead

Leave on average pay is earned at the rate of 2/11ths of the period spent on duty, and study leave is granted to the extent of 12 months in the total service Officers of European domicile are entitled to four free return first class passages from a port in India to a port outside India in their whole service There is a provident fund to which members of the Service contribute 10 per cent of their pay The Service contributes another 10 per cent, which accumulates at interest and is repaid on retirement

Vacancies are few, usually three or four only in each year Candidates in the United Kingdom should apply to the medical adviser Countess of Dufferin's Fund, care of the High Commissioner for India, India House Aldwych London W C 2 Candidates in India should apply to the Chief Medical Officer, Women's Medical Service, Dufferin Office Red Cross Building, New Delhi

COLONIAL MEDICAL SERVICE

THE Colonial Medical Service consists of officers holding scheduled appointments in the following dependencies which are administered under the direction of the Secretary of State for the Colonies :—

(a) *Tropical Africa*—Kenya, Nyasaland, Tanganyika Territory, Uganda Somaliland Zanzibar, Northern Rhodesia, Nigeria, Gold Coast Sierra Leone and Gambia. (b) *Eastern colonies and protectorates*—Ceylon Hong Kong Straits Settlements and Malay States (c) *West Indian and neighbouring colonies*—Jamaica, Bahamas, Barbados, Bermuda, Windward Islands, Leeward Islands, Trinidad, British Guiana, and British Honduras (d) *Western Pacific*—Fiji, Gilbert and Ellice Islands, and British Solomon Islands (e) *Mediterranean*—Cyprus and Gibraltar (f) *Middle East*.—Palestine (g) *Various islands*—e g, Mauritius, Seychelles, Falkland Islands, and St Helena

The various colonial Government medical departments employ about 700 European medical officers and also a large number of qualified Asiatic and African medical officers who are appointed locally Included in this total are about 30 qualified European lady medical officers About 850 trained nursing sisters and health visitors are employed, most of whom are Europeans In addition there are large numbers of subordinate personnel, sanitary inspectors, medical assistants, and dressers, most of whom are natives of the areas in which they serve

An officer of the Colonial Medical Service has opportunities for the practice of his profession in general medicine and surgery as well as in the special branch of tropical medicine On joining a medical department his duties include medical, surgical, and public health work He may be posted to an outlying or bush station where he will be responsible for all the medical activities in connexion therewith, or he may be attached for duty at one of the large hospitals Every encouragement will be given to him to pursue any specialist work in which he is interested Great importance will be attached to a candidate's post-graduate experience, as in the outlying districts he will often be called on to deal with emergencies without being able to seek the advice and assistance of his colleagues

VACANCIES

Vacancies for medical officers may occur at any time of the year and are dealt with as circumstances require, 47 vacancies were filled in 1937 and 54 in 1938 In normal circumstances vacancies are most frequent in Tropical Africa and Malaya In the West Indian colonies, Ceylon, and Mauritius the junior posts are almost always filled by the appointment of qualified local candidates, in Malta all posts are so filled

The vacancies for which candidates are selected from outside the Service are generally those for ordinary medical officers Appointments for specialists are almost invariably reserved for officers who are already in the Service, and who have shown outstanding merit in a particular branch of medicine or surgery A few vacancies may be expected annually, usually in West Africa and Malaya, for lady medical officers

QUALIFICATIONS AND TRAINING

Candidates must be fully qualified British subjects under 35 Preference is given to candidates who are under 30, and to those who have held hospital or public health appointments, or who have special knowledge of medicine surgery, anæsthetics radiology, ophthalmology, gynæcology and midwifery, &c Lady medical officers must have had experience in maternity and child welfare work

Selected candidates are normally required to undergo a course of instruction in tropical medicine and hygiene at the London School of Hygiene and Tropical Medicine the Liverpool School of Tropical Medicine or at Edinburgh University before taking up their appointments The cost of tuition and the diploma examination fees, if the candidate is successful are paid by the Government together with an allowance of £25 a month during the period of

instruction. If an officer has not taken a course of instruction in tropical medicine before appointment, he is usually required to take one during his first leave of absence.

EMOLUMENTS

When considering the scales of salary offered in the Colonial Medical Service, candidates are particularly advised to consider the general conditions of service It will frequently be found that the actual value of an appointment is considerably greater than is indicated by the salary alone. For example, all scheduled appointments are pensionable, in most dependencies free quarters (or allowances in lieu) are provided, and in almost all, free medical attendance Passages are also, generally speaking, provided at Government expense when an officer proceeds on leave, for himself and his wife; and assistance is given towards the cost of passages for his children In those colonies in which income-tax is payable, the rates are usually much lower than in the United Kingdom. At the same time, the cost of living in the dependency concerned should be taken *into account in order to obtain a true comparison*, and candidates should therefore consult the handbook "Information as to the Conditions and Cost of Living in the Colonial Empire" which is published by the Stationery Office at 3*s* 6*d*.

Salaries vary in the different dependencies, and it is not possible to set them out here in detail The commencing rates range from £500 a year in Cyprus to £600 and £660 in Tropical Africa and £700 in Malaya and Hong-Kong. Most officers have a normal expectation of reaching £1000 a year or more by increments, subject only to efficiency, and there are many higher-grade, specialist, and administrative posts carrying *salaries from £1150 up to £2000 a year. The actual* number of posts and rates of salary can be obtained from the director of recruitment at the Colonial Office.

GENERAL CONDITIONS OF SERVICE

Probation.—Officers are normally appointed on probation in the first instance. The period is usually two or three years, and officers whose service has been satisfactory are then confirmed in their appointments, their period of probation being counted as part of their pensionable service

Acting and other allowances.—An officer appointed to act in a higher post in the absence of the substantive holder of that post is usually granted an allowance in recognition of the additional responsibilities which he thereby assumes Travelling and transport allowances are granted under the regulations of each dependency to officers who are required to travel on duty; and generous provision is made to assist, by means of advances, officers who wish to purchase motor-cars which will be of use to them in the performance of their duties

Quarters.—Free quarters, with heavy furniture, are provided (or allowances are paid in lieu) in all the East and West African dependencies and in Fiji and the Western Pacific Islands, and in the case of some appointments in Hong-Kong Government quarters for which officers are required to pay rent (which is usually calculated as a small percentage of salary) are normally provided in Ceylon, the Straits Settlements, and the Federated Malay States In the smaller dependencies Government quarters are not usually available

Marriage.—In general as few restrictions as possible are imposed on the employment of married officers in the Colonial Service Moreover, where conditions are suitable, married officers are encouraged to have their wives and children with them as much as possible.

Private practice.—No officer of the Colonial Medical Service is entitled, as of right, to private practice, the Service being envisaged as essentially one of whole time officials whose primary duty is to the State The conditions, if any, under which officers are permitted to engage in private or consulting practice, and to receive fees from members of the public, are determined by local regulations

Promotion and transfer.—Senior appointments are usually filled by promotion, and officers are considered by the Secretary of State for any vacancy for which they may be suitable and qualified whether the vacancy arises in the particular dependency in which they may be serving at the time or elsewhere An officer may be transferred to any post which is not of less value (due regard being had to climate and other circumstances) than that which he already holds

Leave.—Officers are as a general rule eligible for vacation leave with full salary, together with leave for the normal period occupied by the voyages between the dependency and the United Kingdom, after a tour of resident service which, within specified limits, is at the discretion of the Governor. Leave is, in most cases, calculated on the basis of a fixed number of days in respect of each completed month of resident service As an example, in West Africa the normal tour is 18 months and leave of 7 days is granted for each completed month of service In addition provision is made for sick leave which is usually granted with full salary up to a maximum of six months and if necessary with half salary for a further six months.

Passages.—Free passages from the United Kingdom on first appointment are usually granted for officers and, if they are married, for their wives and children, provided that the permission of the Government is obtained, if required, for the officer's wife and family to proceed to the dependency concerned; but the maximum number of passages paid for from public funds is limited to five When on leave free passages for officers and for their wives are normally granted once each way in respect of each tour In all dependencies except the West Indian Colonies, Seychelles, and West Africa assistance can under varying conditions be obtained towards the cost of passages for children.

PENSIONS

Pensions are granted under local laws, the provisions of which vary in detail The minimum period of service necessary to qualify for a pension is ten years If an officer retires after less than ten years' service, a gratuity *may be granted* Except in Bermuda, no deductions are made from salaries in consideration of the grant of pensions.

The normal rate of pension is 1/600th of final pensionable emoluments[1] for each completed month of service

In some dependencies an officer may elect within a specified period to be paid on retirement a reduced pension equal to three-quarters of the full pension he has earned, together with a gratuity equal to ten times the amount of the reduction In some other colonies—e g, in West Africa—this form of award is compulsory.

The normal retiring age is 55 except in the Bahamas, Barbados, Bermuda, and Jamaica, where it is 60 But officers may in most colonies be called upon to retire with the approval of the Secretary of State, or may elect to retire voluntarily at the age of 50.

In the majority of colonies there is provision for the grant to the legal representative of an officer who dies while in the Service, of a gratuity not exceeding one year's pensionable emoluments

Widows' and orphans' pensions.—In most dependencies officers, whether married or not, are required to contribute to local schemes which provide for the payment of pensions to widows and orphans Contributions vary but are generally 4 per cent of salary The schemes are subsidised by the colonial Governments concerned, and the pensions are based upon actuarial tables

Further information as to the staffs, the climate, and local conditions will be found in the Dominions Office and Colonial Office List which may be consulted in most public libraries. Leaflets concerning nearly all the tropical dependencies are issued for the use of intending settlers and others by the Oversea Settlement Department, Caxton House, Tothill-street, London, S.W.1. Information about general

[1] "Pensionable emoluments" means salary plus any other emoluments, such as the value of free quarters, which are pensionable under the local law.

conditions in Malaya is obtainable from the Malayan Information Agency, 57, Trafalgar square, London, W C 2

Applications for appointment to the Colonial Medical Service should be addressed to the director of recruitment (Colonial Service), Colonial Office, 8, Buckingham gate, London, S W 1, who will furnish without charge a memorandum containing full information regarding the Service

SUDAN MEDICAL SERVICE

This service is responsible for carrying out civil medical work and public health duties in the Sudan, and for the health of the Sudan Defence Force

The British staff consists of a director, 3 assistant directors (hygiene and public health, hospitals, laboratory services), a senior physician and a senior surgeon to the Khartoum Civil Hospital, a Government gynæcologist and obstetrician and a Government ophthalmologist, a medical officer of health, Khartoum Province, a bacteriologist, and a number of (at present 34) British senior medical inspectors and medical inspectors Medical inspectors are first appointed on probation for two years Pay commences at £720 and rises by five biennial increases to £1080, and after 13 years' service to £1200, with higher scales for the senior posts

The service offers a great variety of work among many different races Leave of 90 days is usually granted every year after the first 18 months of service, and study leave may be given for special purposes There is a pension and provident fund, the details of which may be found in the pamphlet of "Information for Candidates" Private practice is allowed but is limited to a few of the larger towns The duties include acting as consultant to the principal hospitals, the supervision of medical and public health work, the inspection of schools, the examination of candidates for Government service and pension, and the training of medical assistants and Sudanese sanitary officers and overseers The Khartoum medical school is staffed by members of the service, who receive additional remuneration for this work

Further information may be obtained from Dr H C Squires, C M G, 93, Harley street, London, W 1

SOUTHERN RHODESIA MEDICAL SERVICE

The Government maintains a medical and public health service in three categories (*a*) full-time appointments (11), (*b*) Government medical officers (25), who in addition to their Government duties supply in whole or in part the general practitioner service in all stations except the two larger towns, and (*c*) medical officers (13) who receive a subsidy of about £250–£360 a year and are mostly mine medical officers or medical missionaries

The full time appointments are as follows —

	Salary
Medical director and chief health officer	£1750
Directors of laboratories, Salisbury and Bulawayo	£1000–£1250
Radiologist Salisbury	
Medical superintendent mental hospital	
Field officer	
Male school medical officer	£800–£1000
Female school medical officer	£600–£900
Assistant medical officer mental hospital	£600–£750 plus £130 in lieu of private practice

Government medical officers on appointment are posted to Grade 2 at a salary of £600, rising to £750 a year Promotions are made as vacancies occur to posts in Grade 1 at salaries of £750–£1250 a year

Officers are usually entitled to private practice, the earnings from which range from £200 a year upwards Their duties include supervision of the Government hospitals (of which there are 13) and native clinics, medico legal duties, and medical supervision of gaols, police camps, and Government stations

Leave is granted at the rate of one eighth of service, and can be accumulated to six months at one time. After two years' service medical officers under 45 are eligible for appointment to the fixed establishment and contribute to a pension scheme The retiring age is 60

All appointments in Great Britain are made by the High Commissioner for Southern Rhodesia, Rhodesia House, 429, Strand, London, W C 2, who will supply further details on request

INDUSTRIAL APPOINTMENTS

Service with a big commercial or industrial corporation is well worth the consideration of those contemplating a medical career in the tropics Permanent and semi permanent employment is to be found on tea estates, rubber plantations, oil fields, and mines, and medical officers are also required temporarily on engineering works such as the building of bridges, barrages, and hydro electric schemes The British Medical Association has recently studied the position of this unofficial service and has, with the coöperation of the principal industrial concerns, drawn up a model form of contract as a guide both to employers and to medical men in arranging their contracts In consequence the conditions of service are generally satisfactory The average commencing salary is about £1000 a year with free quarters and certain allowances, rising to £2000, or even higher salaries Medical officers to estates or mines overseas are offered an interesting and varied field in which to practise their profession They have under their care a group of Europeans and a large labour force, and, in addition, are usually responsible for sanitation and for measures for the prevention of disease on their estates

INFECTIOUS DISEASE
IN ENGLAND AND WALES DURING THE WEEK ENDED AUG 12, 1939

Notifications —The following cases of infectious disease were notified during the week Smallpox, 0, scarlet fever, 1320, diphtheria, 720, enteric fever, 32 (50 "expected"), pneumonia (primary or influenzal) 317, puerperal pyrexia, 175, cerebro spinal fever, 21, poliomyelitis, 15, polio-encephalitis, 3, encephalitis lethargica 3 dysentery, 17, ophthalmia neonatorum, 68 No case of *cholera plague*, or typhus fever was notified during the week

The number of cases in the Infectious Hospitals of the London County Council on Aug 12 was 2330 which included Scarlet fever 527 diphtheria 498 (carriers, 17) measles 15 whooping-cough 619 puerperal fever 16 mothers (plus 9 babies) encephalitis lethargica, 302 poliomyelitis 20 At St Margaret's Hospital there were 10 babies (plus 5 mothers) with ophthalmia neonatorum

Deaths —In 126 great towns, including London, there was no death from smallpox or enteric fever, 3 (0) from measles, 7 (0) from scarlet fever, 11 (1) from whooping-cough, 14 (1) from diphtheria, 27 (5) from diarrhœa and enteritis under two years, and 8 (1) from influenza The figures in parentheses are those for London itself

Birmingham reported 2 deaths from whooping-cough 1 fatal cases of diphtheria were scattered over nine great towns Liverpool and Coventry each reporting 2 Liverpool had 2 deaths from diarrhœa

The number of stillbirths notified during the week was 207 (corresponding to a rate of 35 per 1000 total births) including 40 in London.

instruction If an officer has not taken a course of instruction in tropical medicine before appointment, he is usually required to take one during his first leave of absence

EMOLUMENTS

When considering the scales of salary offered in the Colonial Medical Service, candidates are particularly advised to consider the general conditions of service It will frequently be found that the actual value of an appointment is considerably greater than is indicated by the salary alone. For example, all scheduled appointments are pensionable; in most dependencies free quarters (or allowances in lieu) are provided, and in almost all, free medical attendance Passages are also, generally speaking, provided at Government expense when an officer proceeds on leave, for himself and his wife, and assistance is given towards the cost of passages for his children. In those colonies in which income-tax is payable, the rates are usually much lower than in the United Kingdom. At the same time, the cost of living in the dependency concerned should be taken into account in order to obtain a true comparison, *and candidates should therefore consult the handbook* "Information as to the Conditions and Cost of Living in the Colonial Empire" which is published by the Stationery Office at 3*s* 6*d*

Salaries vary in the different dependencies, and it is not possible to set them out here in detail The commencing rates range from £500 a year in Cyprus to £600 and £660 in Tropical Africa and £700 in Malaya and Hong-Kong. Most officers have a normal expectation of reaching £1000 a year or more by increments, subject only to efficiency, and there are many higher-grade, specialist, and administrative posts carrying salaries from £1150 up to £2000 a year The actual number of posts and rates of salary can be obtained from the director of recruitment at the Colonial Office.

GENERAL CONDITIONS OF SERVICE

Probation —Officers are normally appointed on probation in the first instance The period is usually two or three years, and officers whose service has been satisfactory are then confirmed in their appointments, their period of probation being counted as part of their pensionable service.

Acting and other allowances —An officer appointed to act in a higher post in the absence of the substantive holder of that post is usually granted an allowance in recognition of the additional responsibilities which he thereby assumes Travelling and transport allowances are granted under the regulations of each dependency to officers who are required to travel on duty, and generous provision is made to assist, by means of advances, officers who wish to purchase motor cars which will be of use to them in the performance of their duties.

Quarters —Free quarters, with heavy furniture, are provided (or allowances are paid in lieu) in all the East and West African dependencies and in Fiji and the Western Pacific Islands, and in the case of some appointments in Hong-Kong Government quarters for which officers are required to pay rent (which is usually calculated as a small percentage of salary) are normally provided in Ceylon, the Straits Settlements, and the Federated Malay States In the smaller dependencies Government quarters are not usually available

Marriage —In general as few restrictions as possible are imposed on the employment of married officers in the Colonial Service. Moreover, where conditions are suitable, married officers are encouraged to have their wives and children with them as much as possible

Private practice —No officer of the Colonial Medical Service is entitled, as of right, to private practice, the Service being envisaged as essentially one of whole-time officials whose primary duty is to the State The conditions, if any, under which officers are permitted to engage in private or consulting practice, and to receive fees from members of the public, are determined by local regulations

Promotion and transfer. —Senior appointments are usually filled by promotion, and officers are considered by the Secretary of State for any vacancy for which they may be suitable and qualified whether the vacancy arises in the particular dependency in which they may be serving at the time or elsewhere An officer may be transferred to any post which is not of less value (due regard being had to climate and other circumstances) than that which he already holds.

Leave —Officers are as a general rule eligible for vacation leave with full salary, together with leave for the normal period occupied by the voyages between the dependency and the United Kingdom, after a tour of resident service which, within specified limits, is at the discretion of the Governor Leave is, in most cases, calculated on the basis of a fixed number of days in respect of each completed month of resident service. As an example, in West Africa the normal tour is 18 months and leave of 7 days is granted for each completed month of service In addition provision is made for sick leave which is usually granted with full salary up to a maximum of six months and if necessary with half salary for a further six months

Passages —Free passages from the United Kingdom on first appointment are usually granted for officers and, *if they are married, for their wives and children*, provided that the permission of the Government is obtained, if required, for the officer's wife and family to proceed to the dependency concerned; but the maximum number of passages paid for from public funds is limited to five When on leave free passages for officers and for their wives are normally granted once each way in respect of each tour In all dependencies except the West Indian Colonies, Seychelles, and West Africa assistance can under varying conditions be obtained towards the cost of passages for children.

PENSIONS

Pensions are granted under local laws, the provisions of which vary in detail The minimum period of service necessary to qualify for a pension is ten years If an officer retires after less than ten years' service, a gratuity may be granted Except in Bermuda, no deductions are made from salaries in consideration of the grant of pensions

The normal rate of pension is 1/600th of final pensionable emoluments[1] for each completed month of service.

In some dependencies an officer may elect within a specified period to be paid on retirement a reduced pension equal to three-quarters of the full pension he has earned, together with a gratuity equal to ten times the amount of the reduction. In some other colonies—e g, in West Africa—this form of award is compulsory

The normal retiring age is 55 except in the Bahamas, Barbados, Bermuda, and Jamaica, where it is 60 But officers may in most colonies be called upon to retire with the approval of the Secretary of State, or may elect to retire voluntarily at the age of 50

In the majority of colonies there is provision for the grant to the legal representative of an officer who dies while in the Service, of a gratuity not exceeding one year's pensionable emoluments

Widows' and orphans' pensions —In most dependencies officers, whether married or not, are required to contribute to local schemes which provide for the payment of pensions to widows and orphans Contributions vary but are generally 4 per cent of salary The schemes are subsidised by the colonial Governments concerned, and the pensions are based upon actuarial tables

Further information as to the staffs, the climate, and local conditions will be found in the Dominions Office and Colonial Office List which may be consulted in most public libraries Leaflets concerning nearly all the tropical dependencies are issued for the use of intending settlers and others by the Oversea Settlement Department, Caxton House, Tothill-street, London, S W.1. Information about general

[1] "Pensionable emoluments" means salary plus any other emoluments, such as the value of free quarters, which are pensionable under the local law.

conditions in Malaya is obtainable from the Malayan Information Agency, 57, Trafalgar square, London, W C 2

SUDAN MEDICAL SERVICE

This service is responsible for carrying out civil medical work and public health duties in the Sudan, and for the health of the Sudan Defence Force

The British staff consists of a director, 3 assistant directors (hygiene and public health hospitals, laboratory services); a senior physician and a senior surgeon to the Khartoum Civil Hospital, a Government gynæcologist and obstetrician and a Government ophthalmologist, a medical officer of health, Khartoum Province, a bacteriologist, and a number of (at present 34) British senior medical inspectors and medical inspectors Medical inspectors are first appointed on probation for two years Pay commences at £720 and rises by five biennial increases to £1080, and after 13 years' service to £1200, with higher scales for the senior posts

The service offers a great variety of work among many different races Leave of 90 days is usually granted every year after the first 18 months of service, and study-leave may be given for special purposes There is a pension and provident fund, the details of which may be found in the pamphlet of "Information for Candidates" Private practice is allowed but is limited to a few of the larger towns The duties include acting as consultant to the principal hospitals, the supervision of medical and public health work, the inspection of schools the examination of candidates for Government service and pension, and the training of medical assistants and Sudanese sanitary officers and overseers The Khartoum medical school is staffed by members of the service, who receive additional remuneration for this work

Further information may be obtained from Dr H C Squires, C M G, 93, Harley street, London, W 1

SOUTHERN RHODESIA MEDICAL SERVICE

The Government maintains a medical and public health service in three categories (*a*) full time appointments (11), (*b*) Government medical officers (25), who in addition to their Government duties supply in whole or in part the general practitioner service in all stations except the two larger towns, and (*c*) medical officers (17) who receive a subsidy of about £250–£300 a year and are mostly mine medical officers or medical missionaries

The full time appointments are as follows —

	Salary
Medical director and chief health officer	£1750
Directors of laboratories Salisbury and Bulawayo	£1000–£1250
Radiologist, Salisbury	
Medical superintendent, mental hospital	
Field officer	
Male school medical officer	£800–£1000
Female school medical officer	£600–£900
Assistant medical officer, mental hospital	£600–£750 plus £130 in lieu of private practice

Government medical officers on appointment are posted to Grade 2 at a salary of £600, rising to £750 a year Promotions are made as vacancies occur to posts in Grade 1 at salaries of £750–£1250 a year Officers are usually entitled to private practice, the earnings from which range from £200 a year upwards Their duties include supervision of the Government hospitals (of which there are 13) and native clinics, medico legal duties, and medical supervision of gaols, police camps, and Government stations

Leave is granted at the rate of one-eighth of service, and can be accumulated to six months at one time After two years' service medical officers under 45 are eligible for appointment to the fixed establishment and contribute to a pension scheme The retiring age is 60

All appointments in Great Britain are made by the High Commissioner for Southern Rhodesia, Rhodesia House, 429, Strand, London, W C 2, who will supply further details on request

INDUSTRIAL APPOINTMENTS

Service with a big commercial or industrial corporation is well worth the consideration of those contemplating a medical career in the tropics Permanent and semi permanent employment is to be found on tea estates, rubber plantations, oil fields, and mines, and medical officers are also required temporarily on engineering works such as the building of bridges, barrages, and hydro-electric schemes The British Medical Association has recently studied the position of this unofficial service and has, with the coöperation of the principal industrial concerns, drawn up a model form of contract as a guide both to employers and to medical men in arranging their contracts In consequence the conditions of service are generally satisfactory The average commencing salary is about £1000 a year with free quarters and certain allowances, rising to £2000, or even higher salaries Medical officers to estates or mines overseas are offered an interesting and varied field in which to practise their profession They have under their care a group of Europeans and a large labour force, and, in addition, are usually responsible for sanitation and for measures for the prevention of disease on their estates

INFECTIOUS DISEASE

IN ENGLAND AND WALES DURING THE WEEK ENDED AUG 12, 1939

Notifications—The following cases of infectious disease were notified during the week Smallpox, 0, scarlet fever, 1820, diphtheria, 720, enteric fever, 52 (50 "expected"), pneumonia (primary or influenzal), 317, puerperal pyrexia, 175, cerebro-spinal fever, 21, poliomyelitis, 15; polio-encephalitis, 3, encephalitis lethargica, 3, dysentery, 37, ophthalmia neonatorum, 88 No case of cholera plague, or typhus fever was notified during the week.

The number of cases in the Infectious Hospitals of the London County Council on Aug 18 was 2530 which included scarlet fever 597 diphtheria 493 (carriers, 17) measles 15 whooping-cough 619 puerperal fever 16 mothers (plus 6 babies) encephalitis lethargica 302 poliomyelitis 26 At St Margaret's Hospital there were 10 babies (plus 5 mothers) with ophthalmia neonatorum

Deaths—In 126 great towns, including London, there was no death from smallpox or enteric fever, 7 (0) from measles, 3 (0) from scarlet fever, 11 (3) from whooping-cough, 11 (4) from diphtheria 27 (5) from diarrhœa and enteritis under two years, and 8 (1) from influenza The figures in parentheses are those for London itself

Birmingham reported 2 deaths from whooping-cough Fatal cases of diphtheria were scattered over nine great towns Liverpool and Coventry each reporting 2 Liverpool had 3 deaths from diarrhœa

The number of stillbirths notified during the week was 207 (corresponding to a rate of 35 per 1000 total births) including 40 in London

POST-GRADUATE STUDY

ALL the undergraduate medical schools throughout the country provide opportunities of more advanced study for their own graduates. Glasgow, for instance, has its own post-graduate association and several of the London schools hold post-graduate weeks at the beginning of October. Apart from these domestic arrangements there is now in London a fully equipped post-graduate school and some of the larger voluntary hospitals have for long organised regular post-graduate courses, while a number are available for special study of many kinds; the same applies to a less extent in the provinces.[1]

In London some 50 general and special hospitals work in conjunction with the Fellowship of Medicine and Post-Graduate Medical Association, which has its office at Room 28 in the House of the Royal Society of Medicine, 1, Wimpole-street, London, W.1. Arrangements are made for courses in medicine and in surgery and the specialties, occupying the whole or part of each day for periods of one to four weeks. Special evening clinical courses for the M R C.P. and F.R.C S (primary and final) examinations are organised at intervals. The membership fee is £1 1s. per annum, which includes the subscription to the monthly *Post-Graduate Medical Journal.*

For many years past a scheme has been in operation to provide courses of post-graduate study for insurance doctors in isolated rural areas Two years ago, in consultation with the Insurance Acts Committee of the British Medical Association, the scheme was widened to enable all doctors with substantial insurance practices to take a refresher course once every five years. Urban as well as rural doctors are eligible for a grant from the Ministry of Health which covers the whole cost of study and if necessary the payment of a substitute while the doctor is away from his practice. This year 29 refresher courses were held in ten provincial centres and 30 courses at the British postgraduate school at Hammersmith. The departments of health also arranged 3 courses in Scotland and 5 in Wales The average number of doctors attending a course is 20, so that about 1300 attended this year, as compared with some 800 last year. In addition to these intensive courses, which last a fortnight, the British postgraduate school arranged one extended course for London insurance practitioners on two afternoons a week; others on similar lines were held at Sheffield and in Kent, and next year there will be four more at other provincial centres.

BRITISH POSTGRADUATE MEDICAL SCHOOL

The school was opened by King George V on May 13th, 1935 It is situated in the grounds of Hammersmith Hospital (L C C) in Ducane-road. Ducane-road runs parallel to Western-avenue to the south of a large area of open ground known as Wormwood Scrubs which can never be built over. On the west lies the prison, and there is an extensive plot on the east, belonging to St. Clement Danes Grammar School, which will also remain open. The hospital grounds cover 14 acres and provide ample room for further building

The new block in which is housed the medical school consists of three floors around a central courtyard. It contains two lecture theatres, each with seating room for 100 students and a separate room for the cinema operator, a complete morbid anatomy and histology department, a library and museum and pathological and bacteriological laboratories. Additional laboratories and accommodation for professors have recently been provided.

The school is controlled by a board of governors made up of 19 representatives of various interested bodies under the chairmanship of Sir John Caulcutt. The school depends for its main income on grants from the Treasury. It is a recognised school of the University of London by which all appointments of professors and readers are made. It works in coöperation with the London County Council which provides the site of the school and the clinical facilities of Hammersmith Hospital, to which have been added a new surgical and maternity block and a large out-patient department. The staff of the school provides the bulk of the professional care of the patients in the hospital. The responsibility for the care of patients rests with the L C C, and although the proper duty of the school is teaching, the two functions of teaching students and treating patients are inseparable.

The work of the school is divided into five departments: medicine, surgery, obstetrics and gynæcology, pathology, and radiology. With the exception of radiology, the directors are professors of the University of London. They are assisted by readers and a varying number of assistants. These are all whole-time members of the staff and are not engaged in private practice There is also a visiting staff, who either take charge of wards for a time or give courses of lectures on their special subjects The school is open equally to men and women It provides for: (1) students from the Empire and abroad who wish to do post-graduate work; (2) newly qualified practitioners who are preparing for higher examinations or specialising in one of the above branches; (3) research students, who are given special facilities for their work; (4) it arranges courses for officers of H.M. Services, both for promotion and for special subjects; (5) short refresher courses for general practitioners The refresher courses are intended especially for insurance practitioners receiving assistance from the Ministry of Health, but the Ministry allows the school to enrol two non-panel practitioners in each class of 20. Each refresher course lasts a fortnight, and in the present year 30 courses are being organised. The subjects dealt with are those of most practical value to insurance practitioners Lecturers taking part in these courses include not only the school staff but also selected teachers from all the medical schools, and visits are arranged to other hospitals in London. Some of the courses are conducted in their entirety by voluntary hospitals without undergraduate schools.

Apart from the special courses, graduates who have the time available join the school for "*hospital* practice and tuition." Such students attend from 10 A.M. to 4 P.M. Clinics are held daily. Students have every opportunity of examining and studying cases under expert guidance, and of receiving tuition thereon. They also attend the regular conferences between the different departments and the radiological and pathological demonstrations, which are held weekly. A special course for the London University diploma in clinical pathology, lasting twelve months, has recently been arranged. The next course will start on Oct. 2nd.

[1] Information about post-graduate work of all kinds and in all places may be obtained from the Central Information Bureau of the British Postgraduate Medical School, at the London School of Hygiene, Keppel-street, London, W C 1.

The inclusive fee for ordinary students is at the rate of 6 guineas for one month, 9 guineas for two months, and 12 guineas for three months Further information about fees for special courses, lodgings, and about post graduate facilities in America and on the Continent can be obtained from the dean at the school or from the sub dean at the Central Information Bureau, which has recently been opened for the convenience of students in the building of the London School of Hygiene and Tropical Medicine, Keppel street, W C 1

SEAMEN'S HOSPITAL SOCIETY

The society possesses six establishments the Dreadnought Hospital at Greenwich, 257 beds, the Albert Dock Hospital, E 16, 55 beds with a fracture clinic and rehabilitation centre, the Hospital for Tropical Diseases, Endsleigh gardens, W C 1, 77 beds, Tilbury Hospital, Tilbury Docks, Essex, 94 beds, King George's Sanatorium for Sailors, Bramshott, Hants, 80 beds; and the Angas Home, Cudham, 30 beds The first and second house surgeons at the Dreadnought Hospital are recognised by the Council of the Royal College of Surgeons of England for the purpose of the Fellowship The London School of Clinical Medicine is attached to the Dreadnought Hospital Residential facilities for the observation of the practice of the wards, special departments, and pathological laboratory of the Dreadnought Hospital are available to ship surgeons upon the recommendations of their shipping company The clinical teaching of the London School of Hygiene and Tropical Medicine is given at the Society's Hospital for Tropical Diseases, Endsleigh gardens

RESEARCH

Medical Research Council

The Council maintains a central research institute, the National Institute for Medical Research, at present situated at Hampstead, and it has in its service a whole time research staff working there and at various other institutions throughout the country Clinical research units at several hospitals are wholly or largely maintained by the Council Temporary grants, either for the personal remuneration of investigators or for their research expenses, are made in respect of approved schemes of work in clinical and other aspects of medical science, and a system of post graduate studentships and research fellowships in clinical science and experimental pathology has been instituted to encourage young British medical graduates of special ability and original mind to undertake research Travelling fellowships in medicine are annually awarded by the Council on behalf of the Rockefeller Foundation of New York, and others restricted to the field of tuberculosis from a special benefaction for the purpose Junior and senior fellowships for research in tropical medicine are also awarded annually

Inquiries about grants, studentships, or fellowships should be addressed to the secretary, Medical Research Council, 38, Old Queen street, London, S W 1, from whom further particulars and forms of application may be obtained

Royal College of Surgeons of England

The Research Department consists of two sets of laboratories—the Bernhard Baron laboratories in the College building at Lincoln's Inn fields and the Buckston Browne surgical research farm These two units provide facilities for workers who desire to undertake investigations which will throw light on problems of surgical diagnosis and treatment and investigations in the field of medical science generally Although fellows and members of the College have first call on the facilities of the laboratories, workers who do not hold these diplomas are given facilities when accommodation is available

Application should be made to the director of research, Royal College of Surgeons, Lincoln's Inn fields, London, W C 2, stating qualifications, experience, and an outline of the proposed research When a worker is accepted he is allowed, if he so wishes, to reside at the research farm where a limited number of single rooms are provided Physiological equipment, X ray apparatus, histological facilities, and operation theatres are provided in each unit

The College offers a limited number of scholarships, and also provides funds to defray either the whole or a part of the expenses of approved researches Vacancies for research scholars are announced in the medical press, usually in the months of June or July.

GENERAL HOSPITALS

Royal Northern Group

The Royal Northern Hospital, Holloway, is the main institution of the group which includes the St David's wing for private patients (including a certain number of maternity cases), the Royal Chest Hospital, City road, Grovelands Hospital (recovery branch), Southgate, the Maternity Nursing Association, and the Reckitt Convalescent Home, Clacton on-Sea The total number of beds in the group is 484 At the Royal Northern the large rectangular and circular wards, each of which contains 25 beds, the maternity ward and children's ward for children up to 11 years of age, the observation wards in the casualty department, the six operation theatres, and out patient department are designed with a view to offer the greatest facilities for clinical work Demonstrations are given daily in the wards and out-patient departments Clinical assistants (qualified), clinical clerks, and pathological clerks are appointed in the general and special departments, and, may receive certificates at the end of their terms of office

Prince of Wales's

This hospital, situated in Tottenham, is in the midst of a densely populated neighbourhood, and contains medical, surgical, gynecological, and children's wards having 238 beds There are special departments for gynæcological cases, diseases of the eye ear, throat, and nose, skin diseases, medical electricity, radiography, and dentistry Operations are performed every afternoon of the week (except Saturday) and on Wednesday and Thursday mornings Clinical instruction is given in the wards and out patient departments, laboratories, and lecture hall in connexion with the North East London Post Graduate College attached There are six resident medical officers, and clinical assistants are appointed under certain conditions Special intensive post graduate courses are held at intervals

National Temperance Hospital

The hospital (Hampstead road, N W) contains 160 beds The medical and surgical practice of the hospital is open to students and practitioners Operations Monday, 10 30 A M and 1 30 P M, Tuesday and Wednesday 2 P M, Thursday, 9 15 A M, Friday 11 A M Out patient departments for the following classes of case have been opened dermatology, ophthalmology, oto rhino

laryngology, diseases of the chest and of the rectum. There are also an out-patient gynæcological clinic, a fracture clinic, and an artificial pneumothorax clinic.

Hampstead General and North-West London

The hospital at Haverstock Hill has 138 beds and embraces all acute general wards with a pathological department, extensive and up-to-date X ray and massage departments, with a casualty department and consultative out-patient clinics. The main out-patient department is at Bayham-street, Camden Town. Post-graduate lectures are held during the winter months free to medical practitioners Resident appointments · house physician, 2 house surgeons, casualty medical officer, casualty surgical officer.

Metropolitan Hospital

At this hospital in Kingsland-road there are 150 beds, including 17 for children. Operations are performed morning and afternoon daily. In the large out-patient department, in addition · to the usual general facilities, there are fracture clinics and special departments for neurological, ophthalmic, rectal, genito-urinary, ear, nose, and throat, skin, and dental cases, diseases of women, and electrotherapy. The services of an associate surgeon for neuro-surgery and for thoracic surgery are available There are also a V.D. clinic and a tuberculosis dispensary.

Queen Mary's Hospital for the East End

This hospital, which has developed from the West Ham and Eastern General Hospital, has 219 beds and ministers to a very poor public Founded as a dispensary in 1861, it has become a valuable charity with a full medical staff of physicians and surgeons, and specialists for gynæcology, obstetrics, ophthalmological surgery, radiology, dermatology, and dental surgery. The King George V operating theatre suite costing £20,000 was opened in 1938 The Fellowship of Medicine makes frequent use of its facilities. The pathological laboratory carries out investigations for other hospitals and for local authorities The resident staff consists of a resident medical officer, 2 casualty officers, 2 house physicians, 2 house surgeons, and 2 obstetric house surgeons

L.C.C. Hospitals

To Hammersmith Hospital is attached the British Postgraduate Medical School At St. Alfege's students for the final F.R C S. at Guy's can examine select cases under a surgical tutor. At St Andrew's a consultant surgeon holds weekly classes for two periods of about ten weeks before the same examination. The South-West London Post-Graduate Association has its headquarters at St. James' Hospital where three sessions of lectures are delivered annually in the autumn, spring and summer; in collaboration with the Fellowship of Medicine instruction is given in orthopædic surgery and special anæsthesia for plastic surgery. At the North-Western and Brook Hospitals lectures and demonstrations on clinical practice and hospital administration are given to candidates for the public health diploma, and courses in the modern methods of diagnosis and treatment of venereal diseases are held at the Whitechapel Clinic.

The majority of the general hospitals are recognised for qualification for candidature in branch 1 of the University of London M D. examination Eighteen of the general hospitals are recognised by the Royal College of Obstetricians and Gynæcologists for candidature for their diploma and membership Seventeen general hospitals are recognised by the Royal College of Surgeons of England for the purposes of the final fellowship examination and are also recognised for the purpose of the diploma in anæsthetics Appointments at Queen Mary's Hospital for Children, Carshalton, are recognised for the Conjoint Board's diploma in child health

Special departments for the treatment of various diseases have been established as follows —

Unit.	*Hospital*
Plastic surgery	St James'
Thoracic surgery	St Mary Abbots
Thyroid disease	New End
Radium and deep X ray therapy.	Hammersmith Lambeth
Urological diseases	St Mary, Islington St Mary Abbots
Rheumatism	St Stephen's
Vulvo-vaginitis and ophthalmia neonatorum	St Margaret's
Congenital syphilis in children	St John's
Surgery of cardiovascular diseases	Lambeth.
Foreign bodies in air-passages and upper food passages	St Giles'.
Diabetes	Mile End St Peter's St George-in-the-East
Out-patient psychiatric clinics	Mile End. St Charles' St Mary, Islington
Rheumatism in children	Norwood
Facial paralysis	St Olave's
Puerperal fever	North-Western
Poliomyelitis (infectious cases)	Western
Otological (infectious) cases	Southern
Congenital malformations in children	Queen Mary's, Carshalton
Post-encephalitis lethargica	Northern.
V D in women	Sheffield-street.

PSYCHOLOGICAL MEDICINE

Maudsley Hospital

The hospital contains 290 beds, of which 30 are in the children's wing and 60 in the private block. There is also a large out-patient department which deals with children and adults separately The clinical material covers practically the whole range of psychological medicine, but chronic or unwilling cases are not admitted to the wards, there are facilities for post-graduate students at the hospital to observe such cases by attending the practice of an observation ward in the district In the clinical unit the teaching and research are directed by the professor of clinical psychiatry and the clinical director. Facilities for gaining clinical experience or for carrying out research are open to qualified medical practitioners There is a vacancy every six months for two resident clinical assistants The clinical staff of the hospital consists of a professor, who is also the medical superintendent, a clinical director, 11 full-time physicians, 6 half-time physicians engaged in psychotherapy, and 2 in diagnostic work in the out-patient department There are also 4 fulltime workers in clinical research. With the hospital is associated the central pathological laboratory of the 16 mental hospitals (approximately 35,000 beds) of the London County Council, directed by the professor of pathology of mental disorder, with an established staff of four members, with research workers in all departments Grants-in-aid are available for approved research. A course of lectures and demonstrations for the diploma of psychological medicine is held annually from January to June. A period of clinical work at the hospital meets the requirements of the examining bodies in respect of practical study in psychological medicine.

Tavistock Clinic

The courses of training given at the clinic (The *Institute of Medical Psychology*) are intended for post-graduate students and those wishing to specialise in psychotherapy.

A systematic course of lectures is given from October to June The first part of this course (October to December) makes a complete introductory course in psychotherapy for those desiring an introduction to the subject For those wishing a more complete course, a systematic course of lectures of a more advanced nature is continued for the rest of the academic year Besides these the clinic provides a year's clinical course, with facilities for the advance study of and practice in the treatment of the psychoneuroses and early psychoses This course of clinical work and instruction is given under the personal supervision of senior members of the staff. It includes nine hours' weekly actual treatment of cases by the student There are also tutorials and case discussions The yearly clinical course is usually limited to twelve students This teaching is recognised by the University of London for the requirements of the post graduate diploma in psychological medicine (Regulation 3, part II, sections *d* and *e*)

A liaison with Hill End Mental Hospital and Clinic now exists, whereby those students taking the course at the clinic who have not had mental hospital experience may receive instruction and practice in psychiatry at that institution A series of ten clinical lectures on child psychology takes place on Thursday afternoons during April, May, and June, this is intended especially for school medical officers, members of the maternity and child welfare group of the Society of Medical Officers of Health, and others interested in work with children An intensive course of lectures on the psychoneuroses held annually in June is particularly intended for practitioners in the provinces who cannot attend the year's course A course on the neuroses in general medicine will be given during the year by leading specialists for general practitioners

Further information can be obtained on application to the educational secretary, The Tavistock Clinic, Malet-place, W C 1

Bethlem Royal Hospital

A course of lectures and practical instruction for the diploma in psychological medicine is held when possible at St Bartholomew's medical school and at Bethlem Royal Hospital twice annually, during the spring and autumn In addition to the above, clinical instruction in psychological medicine is given at the hospital every morning (except Wednesdays) at 11 A M House physicians are appointed for a term of six months in February May, August, and November in each year Clinical assistants are appointed from time to time for periods of three months or longer The physician superintendent at the hospital, Monks Orchard, Eden Park, Beckenham, will supply further particulars

TROPICAL MEDICINE

The Universities of Edinburgh and Liverpool grant diplomas in tropical medicine for which courses of instruction are given at their own schools (see p 522)

London School of Hygiene and Tropical Medicine

The course of instruction in tropical medicine and hygiene lasts five months and is designed to enable candidates to take the Conjoint Board's diploma in tropical medicine and hygiene, but members of the class may qualify for a school certificate at the end of four months

Two courses are offered annually, starting in October and March respectively The tuition fee is £40

NEUROLOGY

National Hospital, Queen-square

The hospital, with the convalescent home at East Finchley, contains 265 beds and cots The out-patient physicians attend every Monday, Tuesday, Wednesday, Thursday, and Friday at 2 P M, and the physicians on the same days Clinical clerks are appointed under physicians and clinical assistants to out patient physicians Post-graduate courses of lectures and demonstrations are held twice every year, usually commencing in January and October, and lasting about nine weeks Special courses in neurological ophthalmology, neuro-pathology, and the anatomy and physiology of the nervous system are given The pathological laboratory is available for special work under the pathologist

Maida Vale Hospital for Nervous Diseases

The hospital contains 85 beds including 20 private wards and 6 pay beds It is a neurological hospital, fully equipped for dealing with both surgical and medical cases with the following special departments massage, medical gymnastics, pathological, aural, dental, ophthalmic, X ray, psychological, psychiatric Monthly demonstrations are held for general practitioners and a monthly demonstration is given in connexion with the British Postgraduate Medical School Spring and autumn courses are held for the D P M in conjunction with the Maudsley Hospital course Two resident appointments, resident medical officer and house physician, fall vacant in May and November

West End Hospital for Nervous Diseases

The clinical and teaching facilities of this hospital of 76 beds (including 25 cots) fulfil the requirements of the examining bodies for the diploma in psychological medicine, and for the M D Lond At the out-patient department in Welbeck-street there are some 35,000 attendances in the year The general practice of the hospital is open to post-graduates and there are opportunities for personal examination of cases Systematic courses of instruction in neurology and in related subjects are held throughout the year, and special courses for the D P M and the M R C P Clinical demonstrations of psychological cases are given by members of the psychiatric department, with pathological discussions, special demonstrations upon child guidance, and the neurological aspects of various subjects, including radiology, ophthalmology, orthopædics, physical medicine, and oto-rhino laryngology Honorary clinical assistantships are available in the out patient department

HEART AND LUNGS

Royal Chest Hospital

The Royal Chest Hospital, City road, associated with the Royal Northern group of hospitals, has accommodation for 84 in patients and a large out-patient department, open daily Special departments include thoracic surgery, cardiology, laryngology radiology, electrocardiograph, massage and physical exercises, and an ultra violet light clinic Clinical assistants are appointed to work with the physicians in the out patient department Post graduate courses are held three or four times a year The tuberculosis dispensary for Islington south is attached to the hospital

Brompton Hospital for Consumption and Diseases of the Chest

The hospital contains 368 beds of which 57 are allocated to the surgical side and 98 to paying patients A further 150 beds are provided at the

sanatorium at Frimley, which also contains beds for paying patients The beds for paying patients at the hospital are so divided up as to provide wards of two and five beds each at a small inclusive fee, and single bedrooms in which the fees are non-inclusive. In addition to the resident medical officer there are 2 resident surgical officers appointed annually, an assistant resident medical officer, who assists in the artificial pneumothorax clinic, and 6 resident house physicians, whose duties include attendance at the out-patients' and special departments, and one of whom serves as assistant to the tuberculosis officer for Chelsea. These officers are appointed for a term of six months each. Post-graduates are admitted to the practice of the hospital Clinical assistants are appointed to the in-patient and out-patient physicians, the surgeons, and the special departments of the hospital Clinical demonstrations in the wards, the out-patient and special departments are given throughout the year, and two special medical and two special surgical post-graduate courses of one week each are held annually Special courses are also held every month except July for candidates for the M R C P. examination and for candidates for the final examination in medicine of the Conjoint Board.

London Chest Hospital

The hospital was founded in 1848, and is situated on the edge of Victoria Park. Accommodation: 190 beds (including private beds) for tuberculosis, non-tuberculous lung diseases, and cardiovascular diseases. There is a surgical block of 10 single bedrooms for major thoracic surgery. Special departments: surgical, laryngological, bronchoscopical, radiological, pathological, electrocardiographic Assistants are appointed to the clinics, and a limited number of research workers to the pathological department. The in-patient staff visit generally in the afternoon; out-patients at 2 P.M Graduates are admitted on payment of fees which entitle them to attendance at clinics, post-mortem demonstrations, and operations Special demonstration and lecture courses are provided. Graduates desiring assistantships in any department should apply to the dean Resident appointments comprise a resident medical officer, 3 house physicians, and a house surgeon. The first is a 12 months' appointment, the others 6 months. Applications for vacancies should be made to the secretary.

CHILDREN

Hospital for Sick Children, Great Ormond-street

The hospital was founded in 1852 and has the distinction of having been the first hospital for children only in the United Kingdom It is now being entirely rebuilt in accordance with the most modern principles, the ward block and laboratories being already completed. The new hospital contains 326 beds, of which 36 beds are for private patients. The out-patient department deals with over 30,000 new cases annually There are asthma, dental, rheumatic, venereal diseases, skin, aural, ophthalmic, and child guidance clinics, and X ray, electrotherapy, and massage departments. Clinical instruction is given daily by members of the staff; morning sessions 10 A M–12 noon, out-patients' clinics; afternoon sessions, 2–4 P.M, include ward visits and surgical operations The practice is open to students of both sexes who have completed four years' medical study and also to qualified medical men and women, who may attend for periods of one week upwards, the year being divided into three terms of approximately 13 weeks During these terms special lectures are given at the hospital weekly; details of these appear from time to time in the columns of this journal. Clinical clerks are appointed once a month, these appointments being open to fourth- and fifth-year students of recognised medical schools. Time spent in clerking and dressing is recognised by the Universities of London, Oxford, and Cambridge as part of the final curriculum. Facilities are available to post-graduates for obtaining theoretical and practical instruction in clinical pathology, bacteriology, and medical biochemistry in the laboratories *Resident appointments*: assistant physician; medical assistants and clinical pathologists (2), house physicians (4); surgical officer; house surgeons (3), aural registrar; anæsthetic registrar; medical officer, Tadworth Court The appointments are made for six months or one year.

Queen's Hospital for Children

This hospital, for sick children up to 14 years of age, was formerly known as the North-Eastern Hospital for Children. There are 167 beds in London (*Hackney-road, E.2*) and 44 at the seaside branch, Little Folks Home, Bexhill A rheumatism clinic in coöperation with L C.C schools is held twice weekly. There are massage, light, dental and psychiatric departments, and a special whooping-cough physician. The practice of the hospital is open to students by arrangements with the medical staff The following resident appointments are open to both men and women: senior medical officer; house surgeon, house physicians (2); casualty officers (3), including attachment to ear, nose, and throat, ophthalmic, and dermatological departments respectively.

Princess Elizabeth of York Hospital for Children

The hospital has 135 beds and is situated in Glamis-road, Shadwell Resident posts at the hospital are recognised by the Conjoint Board as fulfilling the necessary conditions for the diploma of child health Similar recognition is accorded to clinical assistantships at the hospital The number of these posts is limited to four. Resident posts at the hospital are recognised by London University as part of the requirements for the degree of M D. The hospital provides the usual special departments, including a rheumatism clinic and a special department for plastic surgery. Visitors and students are welcomed at ward rounds and in the out-patient department *Special intensive courses in pædiatrics* are held several times a year both in connexion with the Fellowship of Medicine and the British Postgraduate Medical School at Hammersmith Resident appointments are advertised periodically. These consist of one resident medical officer, one casualty officer, two house physicians, and one house surgeon. Holders of these posts are eligible for election to the Wander travelling fellowship, which is a reciprocity scheme by which one member of the resident staff at Shadwell each year is enabled to take an exchange post at the Children's Hospital, St. Louis, Missouri, U S A., for six months

MATERNITY

Queen Charlotte's Maternity Hospital

This hospital, formerly Queen Charlotte's Lying-in Hospital, is situated in Marylebone-road, and has 130 beds The hospital receives over 2900 patients annually, besides having a large out-patient department. Medical students and qualified practitioners are received at all times of the year. They have unusual

opportunities of seeing obstetric complications and operative midwifery on account of the very large number of primiparous cases—nearly one half of the total admissions Clinical instruction is given on the more important cases which present themselves They also receive valuable instruction in the antenatal and child welfare departments and postnatal clinics, where over 4000 patients attend yearly Special lecture demonstrations are given by members of the staff Pupil midwives are received and specially trained Courses in obstetric analgesia are also given to midwives A residential college provides accommodation for students and qualified practitioners (both men and women), and is opposite the hospital

The isolation block (30 beds) for puerperal fever and puerperal pyrexia, which has been built on the new site at Ravenscourt Park, Hammersmith, was opened in 1930, and the research laboratories, which adjoin this block, are in full working order Students may attend the clinics conducted by the staff at the isolation block, and demonstrations are also given at the research laboratories

The following resident appointments are made assistant resident medical officer (three months), proceeding to post of senior resident medical officer, (also three months), resident anæsthetist and district resident medical officer (six months), resident anæsthetist (three months)

City of London Maternity Hospital

This hospital, founded in 1750 and incorporated by royal charter in 1935, has kept pace with the advancement in medical and nursing science There are 71 beds (8 private) The training of pupil midwives has always been an important feature of the hospital's work for the community, and the thoroughness of this training is ensured by a highly qualified staff There are the following special departments antenatal clinics, three times weekly, remedial exercises clinic, once weekly, postnatal clinic and dental clinic, each once weekly, child welfare clinic (to which a pediatrician has been appointed), twice weekly, sunlight and radiant heat clinics The following special courses are available (*a*) Four months' intensive resident course for the midwife teachers' certificate (*b*) Two weeks' resident course in analgesics (*c*) Four weeks' resident post graduate course for practising midwives (*d*) Occasional week end (non resident) post graduate courses for general practitioners By arrangement with St Bartholomew's Hospital medical school a resident midwifery course is provided for 30 medical students each year (*e*) Six months' resident course in practical housekeeping There are two resident medical officers The junior post is held for three months, with a reversion to the senior post for a further three months

CANCER

Royal Cancer Hospital (Free)

The hospital, situated in Fulham road, S W, contains 127 beds The out patient department is open every week day, except Saturday, at 2 P M also Wednesday and Friday mornings at 10 and Saturday morning at 11 A course of study in physics and radiology, qualifying for the Diplomas in Medical Radiology of the University of London and the Conjoint Board is given The hospital is a recognised teaching school of the University of London in medical radiology, experimental pathology and pathological chemistry A resident medical officer is appointed for 12 months at £200 per annum, and senior and junior resident house surgeons are appointed for 6 months at a salary of £50 Non-resident assistants are appointed in the radiological department for 12 months at salaries of £350

Mount Vernon Hospital

The hospital contains 130 beds for cancer cases It possesses a fully equipped radiological department and extensive research laboratories Much original work is being carried out in its physics department There are facilities for post-graduate instruction Resident appointments are for a period of six months Clinical demonstrations are given by the visiting surgical staff Clinical assistants are appointed to surgeons in the wards The out patient and follow-up departments are at 3, Riding House street, W

Marie Curie Hospital

This hospital, which is officered by medical women, is a centre for the radiological treatment of women suffering from cancer and allied diseases The in-patient department contains 39 beds, of which 8 are for private patients There is a daily out-patient clinic to which cases are sent for diagnosis and at which those already treated are kept under observation The hospital has departments for radium and deep X ray therapy, and for X ray diagnosis The pathological department contains laboratories for clinical and experimental research The practice of the hospital is open to qualified medical visitors, and one graduate wishing to study the subject of radiology is accepted for full time service for three to six months A resident medical officer is appointed every three to six months

OPHTHALMOLOGY

Royal London Ophthalmic Hospital

The attendance at Moorfields Eye Hospital in City road is now very large There are 200 beds Operations are performed each morning and four surgeons attend daily Special courses of instruction are given, which extend over a period of five months, by members of the surgical staff and certain outside lecturers, beginning in October and March The instructions and classes are arranged to meet the requirements for the various diplomas in ophthalmology Students of the hospital are eligible as house surgeons, out patient officers, and clinical assistants The senior resident officer and three house surgeons are appointed every six months Twenty-four out-patient officers are appointed each year Clinical assistants are appointed every three months

Royal Westminster Ophthalmic Hospital

Founded by Guthrie, an army surgeon, in 1816 to treat eye diseases which were increasing after the return of the armies from the Napoleonic Wars this hospital, now situated in High Holborn, in a modern building with well equipped medical school has 100 beds (including 14 for paying patients) and a large out patient department The practice of the hospital is open to both men and women practitioners and students of medicine, who can prepare if desired for the higher diplomas in ophthalmology Post-graduate students of the hospital are eligible for the appointments of resident house surgeon (3), refraction officer (8), and registrar, all of which are paid and senior and junior clinical assistant (unpaid) A scholarship of £100 is awarded annually for research work Clinics are held in the afternoon at 1 30 P M. and on Friday evenings at 5 P M Operations are

performed daily in the theatres from 2 30 P M. Classes for the D.O.M.S. (Parts 1 and 2) are held in winter and summer sessions The next classes start in October. The orthoptic department, in addition to its training of orthoptic students, holds short courses of instruction at intervals for practitioners specialising in eye work.

Royal Eye Hospital

There are 55 beds at this hospital in St. George's-circus, Southwark, and an annual attendance of nearly 80,000 out-patients There is a well-equipped library and museum. The research department includes a contact lens clinic and ultra-violet radiation department. Special classes held in May and October are planned to meet the requirements of students preparing for the D.O.M S and similar examinations. Clinical classes in medical ophthalmology are held for candidates for the M.R C P examinations A course suitable for general practitioners is held in April under the auspices of the Fellowship of Medicine. There are 3 resident house surgeons, 35 clinical assistants, 20 refractionists, and 3 officers in charge of the squint training clinics A research scholarship in ophthalmology of £100 per annum is awarded yearly.

Central London Ophthalmic Hospital

This hospital, in Judd-street, St Pancras, has 51 beds, and clinical teaching is given daily Special departments include one for research into and development of the corneo-plastic surgery of the eye, a contact lens centre, and an orthoptic department for the treatment of squint. Voluntary hospital ophthalmic clinics are held on Mondays, Wednesdays, and Thursdays at 4 30 P M.

EAR, NOSE, AND THROAT

Central London Throat, Nose, and Ear Hospital

This hospital in Gray's Inn-road, with recovery home at Ealing (104 beds), is open daily to qualified medical practitioners on presentation of a visiting card. Demonstrations are given daily by the chief surgeon of each clinic and in the operating theatre. There is a whole-time clinical tutor. There are three vacancies for house surgeons annually, appointments being for nine months. Clinical assistantships, of which there are many, afford the best opportunities of actually handling instruments and dealing directly with patients Twice yearly a "general practitioners' week" is arranged, when the teaching work is restricted to that likely to be most helpful to those engaged in general practice

Comprehensive courses, each lasting five months, begin on Jan. 1 and June 1 They include anatomy and physiology (including facilities for dissection), pathology and bacteriology, radiology, endoscopy, speech therapy as well as lectures and demonstrations by representative members of the specialty other than those on the staff of this hospital and school. The courses are especially suitable for those intending to take the D.L O. (R C P & S.) or the F R C S E. with oto-rhino-laryngology as a special subject.

Golden-square Throat, Nose, and Ear Hospital

The hospital (101 beds), which has absorbed the London Throat Hospital, is situated in Golden-square, near Piccadilly Circus It was founded by Sir Morell Mackenzie in 1862 and is the largest special hospital of its kind in Great Britain. Clinical instruction in the diagnosis and treatment of disease is given daily in the out-patient department from 2 to 4 P.M., and on Tuesdays and Thursdays from 6.30 to 8.30 P.M. There is an annual out-patient attendance of 35,000. Minor operations are performed on Mondays and Wednesdays at 9.30 A M Practitioners and post-graduate students are admitted to the practice of the hospital, and clinical assistants are appointed.

Metropolitan Ear, Nose, and Throat Hospital

This is the oldest ear, nose, and throat hospital in the world, having been founded by James Yearsley in 1838 The hospital is in Fitzroy-square and contains at present 22 beds, but extensions are at present in progress In future the hospital will contain 52 beds, with the most modern accommodation for post-graduate students The hospital is recognised for the D L O. The out-patient department is opened daily at 2 P M, Saturdays 1 P.M., to medical practitioners and senior students Operations upon in-patients are performed four days a week at 10 A M. Clinical assistants are appointed.

ORTHOPÆDICS

Royal National Orthopædic Hospital

This institution, situated in Great Portland-street (490 beds), is a good example of the fusion of scattered activities for the creation of an effective whole The three orthopædic hospitals of the metropolis were combined for the formation of this central institution at the instance of King Edward's Hospital Fund, with the result that the grants from this fund and the income from subscriptions can now be used to far better purpose and with economy. The hospital has also been approved by the Ministry of Health for the treatment of surgical tuberculosis, the connexion between orthopædics and the therapeutics required in many forms of tuberculosis having become obvious. Country branch at Brockley Hill, Stanmore (320 beds). Both branches of the hospital are residential schools for physically defective children, certified by the Board of Education. The hospital provides also a convalescent branch at Stanmore for 44 children and a residential training college for 112 cripples aged 16–22 A post-graduate course of 14 days is held about March each year. The out-patient department is open every week-day, except Saturday, at 1.30 P.M. The evening clinic on Tuesdays from 6 P M. to 8 P.M.

GENITO-URINARY AND RECTAL DISEASES

London Lock Hospital

At this hospital and home are 64 beds for women and children, with special departments for ophthalmic and maternity cases, and for female defectives Male out-patients are seen at 91, Dean-street, Oxford-street, daily from 10 30 until 7; female out-patients and children at 283, Harrow-road, Paddington, from 9 until 8. Special courses of lectures are given in May and November by arrangement with the Fellowship of Medicine. A limited number of practitioners and students can, on application to the dean, attend the hospital practice.

All Saints' Hospital

Founded in 1911 and now at Austral-street, West-square, St George's-road, S.E , this hospital for the treatment of genito-urinary diseases has 55 beds in general and private wards (some temporarily closed) Courses (free) for panel and other practitioners, held during the first week in each month, include cystoscopy and endoscopic methods with special demonstrations in radiography and clinical pathology. Out-patient

clinics at 2 P M on week-day afternoons are open free to practitioners There is a new and completely equipped X ray department

St. Paul's Hospital

This hospital in Endell street, Holborn, has 33 beds, 10 being for private patients and 4 for women It specialises in diseases of the kidneys, bladder, prostate, stricture, stone, and skin affections Out patients are seen every week day afternoon, cystoscopy sessions on Tuesday, Thursday, and Friday mornings; skin cases are seen at 9 A M on Mondays and Fridays The operating days are Mondays, Wednesdays, and Fridays in the afternoon Registered medical practitioners and students are invited to attend any branch of the work

St Peter's Hospital

This hospital for stone in Covent Garden invites practitioners and students to attend its out patient practice, the Friday (9 30 A M) clinic for women and children alone being open to medical women Special fortnightly courses in January, May, and November are arranged by the Fellowship of Medicine

St Mark's Hospital

Founded in 1835 in City road, E C, for the treatment of cancer, fistula, and other diseases of the rectum, this hospital has 63 general and 9 private beds The pathological department and the museum have been enlarged recently and a second operating theatre has been added Practitioners and students are invited to clinical instruction in the wards and out-patient department Operations on week-day afternoons (except Wednesday) at 2 P M Three weekly courses are held during the year in coöperation with the Fellowship of Medicine

SKIN

London School of Dermatology

This school of dermatology is based on St John's Hospital for Diseases of the Skin, with an in-patient department (40 beds) at 202, Uxbridge-road, W, and out patient clinics, at 5, Lisle street, W C 2, are held daily at 2 and 6 P M (Saturdays at 9 30 A M only), when demonstrations are given on the cases presenting themselves The Chesterfield Lectures, constituting a systematic course in dermatology, are given on Tuesdays and Thursdays at 5 P M, during October and November and January and February, by the staff of St John's Hospital and the physicians in charge of the dermatological departments of the London teaching hospitals The lectures are free to those attending the practice of the hospital and to registered medical students At the end of the course an examination is held for the Chesterfield medal in dermatology, open to all medical practitioners A summer course of lectures is also held four times weekly at 5 P M during the month of May each year The electrical department is open, Monday to Friday inclusive, from 2 to 7 P M Laboratory courses in the pathology and bacteriology of the skin can be arranged

DENTISTRY

REGISTRATION on the Medical Register entitles a practitioner to practise dentistry, although he cannot register as such without degree or licence in dentistry, but few dental appointments at general or special hospitals or dispensaries are available save to those with a special diploma, and, until registered on the Dentists Register, no dental work under the additional benefit scheme of the National Health Insurance Act can be undertaken

The examining bodies in dentistry which grant degrees and diplomas in the subject are as follows Royal College of Surgeons of England, Royal College of Surgeons, Edinburgh, Royal Faculty of Physicians and Surgeons of Glasgow, Royal College of Surgeons in Ireland, and the following universities Birmingham, Bristol, Durham Leeds, Liverpool, London, Manchester, Sheffield, St Andrews, Dublin (Trinity College), Queen's University of Belfast and the National University of Ireland The student should apply to the secretaries of the various Conjoint Boards or to the deans of the medical faculties or medical schools for a syllabus

A graduate in dental surgery (M D S or B D S) of a recognised university in the United Kingdom will in future be admitted direct to the second and final examinations of the Royal College of Surgeons of England

TEACHING INSTITUTIONS IN LONDON

Royal Dental Hospital

The Royal Dental Hospital of London, School of Dental Surgery, Leicester-square, is a school of the University of London A chair in dental surgery and pathology has recently been instituted The school provides the special dental education required by the University of London for the B.D S degree and by the Royal College of Surgeons for the licence in dental surgery The general part of the curriculum may be taken at any general hospital There is an in patient department of ten beds where the students attend as dressers Pupils are received for the training in dental mechanics recognised by the curriculum The instructor at the beginning of each session gives a course of lectures on operative dental surgery The two senior house surgeoncies and the six house surgeoncies are held for four months each and are open to all qualified students The lecturers give special demonstrations on the microscopy of dental anatomy and dental surgery The lecturer on dental mechanics also gives practical demonstrations in the laboratory Post graduate instruction can be arranged in any branch of dental surgery There are four entrance scholarships of £50 per annum for two years, in chemistry, physics, biology, and general knowledge, and four scholarships of £25 per annum for two years in dental prosthetics and dental anatomy

University College Hospital Dental School

This hospital and school, situated at the corner of Great Portland and Devonshire-streets, W, has been thoroughly reorganised, and is now fully equipped with the most modern appliances Students are entered as students of University College Hospital, and, as such, attend the classes of anatomy and physiology in University College, which is a few minutes' walk from the dental department in Great Portland street hitherto known as the National Dental Hospital—the first dental school to admit women students Practical courses to comply with the R C S curriculum are held Clinical lectures and

demonstrations are given, and each student on entering passes through a preliminary course under a demonstrator.

Guy's Hospital Dental School

Dental students have the opportunity of attending at this hospital the whole course of instruction required for the B.D S. Lond. or L D S Eng.—viz, the complete course in dental prosthetics, the special lectures and practice of the dental department, and the general lectures and practice of the medical school. Students who enter for a medical as well as a dental course must obtain a degree or licence in dental surgery before commencing the clinical period of their medical course There is ample accommodation for extractions, both with general and local anæsthetics. The conservation room affords accommodation for about 100 dental chairs, with equipment of the most modern type for the use of the dressers, who, under the supervision of the staff, perform the various operations of dental surgery. There is a separate department for denture patients affording accommodation for 15 chairs, and also a special department for children with accommodation for 20 chairs. Instruction is given in operative dentistry on a "manikin" to students during their first three months of clinical study by the staff demonstrators. Students in dental prosthetics are occupied with this subject for two years, during which time a graded, systematic, and full course of instruction is given under the supervision of the professor of dental prosthetics, assisted by five demonstrators, a house surgeon, and skilled mechanics.

The following appointments are held by students: full surgeon's dresser, assistant surgeon's dresser, dresser in the children's department, casualty dresser, dresser to the professor of conservative dental surgery, probationary dresser, clerk to the anæsthetist, and dresser in the general anæsthetic and local anæsthetic rooms.

Two *entrance scholarships* are awarded annually in April as follows: (1) War memorial scholarship in arts of £40 per annum for four years, open to students under 19 years of age. Candidates are required to take English and any two of the following subjects: French, German, Latin, Greek, and mathematics. (2) Science scholarship of £40 per annum for four years, open to students under 20 years of age Candidates are required to take two of the following subjects: chemistry, physics, and biology.

Each year 19 house surgeons, 20 assistant house surgeons, and 4 student demonstrators of dental histology are appointed.

King's College Hospital Dental School

The dental school is part of the medical school of King's College Hospital, and was opened in November, 1923 The dental out-patient department of the hospital is used for the performance of dental extractions. A large conservation room with 40 dental chairs has been equipped Smaller rooms are used for clinical teaching and administrative requirements, and a specially equipped laboratory for training in dental mechanics An X ray apparatus has been installed for use in dental skiagraphy. The dental museum contains a large number of specimens illustrating oral, buccal, dental, and other diseases. The library, lecture theatre, lecture rooms, common rooms, and the refectory are all available for the use of students Courses of study, including practical work, are provided for the degree of bachelor of dental surgery of the University of London, and for the diploma in dental surgery of the Royal College of Surgeons of England. Special arrangements can be made for those students who wish to take a medical degree or qualification in addition to a degree or diploma in dental surgery

The following salaried appointments are open to qualified members of the school: registrar, resident house surgeon, non-resident house surgeons, and tutors in dental mechanics, operative dental surgery, and dental materia medica.

London Hospital Dental School

The dental school at the London Hospital is not a separate organisation but an integral part of the hospital and medical college. The policy of the board of management is to maintain a well-equipped and efficient dental department working in close coöperation with all the departments of the hospital and the medical college. Dental students mix with medical students and are encouraged to become as familiar as possible with general medicine and surgery. Those who can afford it are advised to take both medical and dental qualifications. The dental department of the hospital is equipped with all the necessary modern apparatus for dental work. There is a mechanical laboratory where approximately 500 dentures are constructed by students every year for hospital patients under the supervision of an expert instructor. Last year over 6700 new patients were treated in the hospital by the dental surgeons and their dressers, and the total number of attendances of patients in the dental out-patient department was nearly 26,000. The school therefore affords every opportunity for a student who wishes to gain a sound training in the practice of clinical dental surgery.

The number of students admitted to the school every year is strictly limited so as to ensure that all students shall have an adequate number of patients, and that classes, lectures, and demonstrations shall not be overcrowded.

Dental students share the laboratories in the Medical College with medical students, and special courses are arranged for them by the professors in anatomy, physiology, and pathology. In the Medical College there is a library well equipped with textbooks and dental periodicals, and a common room and dining-room so that students can get lunch and tea without leaving the building. Dental students enjoy all the same social and athletic privileges as medical students, and all the clubs and societies are open to them. A residential hostel provides accommodation for 78 dental and medical students. The Francis Farmer entrance scholarship of £25 in chemistry, physics, and biology is offered every year, and there are a large number of prizes for competition during the different stages of a student's training.

Application for admission should be made to the dean, from whom all further particulars can be obtained.

TEACHING INSTITUTIONS OUTSIDE LONDON

Birmingham Dental Hospital

This hospital was founded in 1858 and the present buildings, erected in 1903, are centrally situated in Great Charles-street. In 1931 there was substantial modernisation and reconstruction of many of the departments, to cope with the increasing numbers of patients. There is accommodation for approximately 100 students The institution serves a wide area in the midlands, and in general this area is regarded as one offering good opportunities to the

recently qualified The hospital, like the great majority of dental hospitals, is without beds at present, but the committee has approved plans for a completely new hospital to be erected at the Hospitals Centre adjoining both the Queen Elizabeth Hospital and the medical school, recently opened by the King and Queen, by this means bed accommodation will soon be available together with other special facilities for the institutional practice and teaching of dental surgery A clinic for the treatment of casualties and for simple extractions will be retained in the centre of the city

Undergraduate instruction is under the control of the professor of dental surgery at Birmingham University and the dean of the dental school, aided by the honorary staff, the demonstrators, and various members of the stipendiary staff Specialised post-graduate courses are arranged Appointments to the stipendiary staff open to students who have graduated are the house surgeonships (for periods of three months, with opportunity for reappointment) which are advertised in the local and professional papers

Leeds University School of Dentistry

The school of dentistry is adequately equipped to provide for the complete training of the dental student It forms a part of the Leeds school of medicine whilst the instruction in clinical and mechanical dentistry is carried out in the Dental Hospital The school is now in occupation of a spacious new building especially designed to the requirements of modern dental teaching The school is also the dental department of the General Infirmary, and its close association with the work of that institution ensures an adequate supply of clinical material, and enables a fuller insight into the position dental surgery holds in relation to general medicine and surgery, especially with regard to the major diseases and injuries of the head and neck The courses of study are mainly designed to meet the requirements of the B Ch D and L D S Leeds but every opportunity is afforded to students preparing for the degrees or diplomas of other licensing bodies Full time teachers give the instruction in clinical dental surgery, prosthetic dentistry, and mechanics, which is carried out under the supervision and direction of the professor of clinical dental surgery and members of the honorary staff Special facilities are provided for instruction in orthodontics, radiography, local and general anæsthetics, and bacteriology Prizes are offered for competition to students in their respective years of study Post graduate clinical courses are arranged in collaboration with the Dental Board of the United Kingdom, and facilities exist to meet the requirements of dental surgeons desirous of obtaining special post graduate instruction

Liverpool University School of Dental Surgery

Students taking courses in dental surgery in the University of Liverpool should take the dental degree (B D S) or licence (L D S) of this university, for which the courses are specially designed, but complete arrangements are also made for students desirous of preparing for the examinations of other licensing bodies Courses of instruction for the whole of the dental curriculum are provided in connexion with the faculty of medicine of the university Students of dentistry take some subjects in the medical curriculum in the same classes as students of medicine, and all the necessary classes in the special subjects of their own curriculum are provided in the university and at the dental hospital The dental school is a modern building and comprises an extensive dental laboratory, dental mechanics demonstration room, operative demonstration theatre, phantom demonstration room, dental, histological, pathological, bacteriological research, and photographic departments, parodontal department, and the offices of the director of dental education The dental hospital, situated in Pembroke place, adjoins the dental school, the university, and Royal Infirmary The ground floor contains a large waiting hall, examination room, extraction and anæsthetic rooms (with special waiting and recovery rooms for each) The first floor contains a large lecture hall, library, museum, and prosthetic department, with special laboratories, and a radiographical department The mezzanine floor contains orthodontic department, oral surgery, operating theatre, staff room, nurses' room, and offices The whole of the top floor is devoted to conservation work, it is lighted entirely from the north, and contains 50 pump operating chairs, brackets, and electric light

Manchester University School of Dental Surgery

Courses of study are provided to meet the requirements for the B.D S degree and the L D S diploma of the University of Manchester, and for the L.D S diploma of the Royal College of Surgeons of England At the Dental Hospital instruction is given in practical dental mechanics, operative dentistry, diagnosis and extraction, orthodontics, dental prosthetics, anæsthetics, and radiography by specially appointed clinical teachers All the courses of instruction are open to women students

Sutherland Dental School and Newcastle-on-Tyne Dental Hospital

The dental department is a component part of the medical school, King's College, Newcastle-on-Tyne, in the University of Durham The Dental Hospital and school, erected within the grounds of the Royal Victoria Infirmary, were opened in 1932 The buildings include lecture and class-rooms, museum, research laboratories, conservation and demonstration rooms (provided with Ritter electric units for the use of each student), operating theatre with preparation and recovery rooms, an extraction department, and X ray apparatus. There is also a mechanical laboratory where the whole of the practical training in dental mechanics may be undertaken and there is abundant material for clinical teaching in the Dental Hospital, the attendances of patients being over 32,000 annually Training in general medicine and surgery is provided in the Royal Victoria Infirmary and systematic lectures are given in the medical and dental schools A scholarship fund of £5000 is available for research in dental science

There are various prizes for students in their respective years, and the Dental Board of the United Kingdom recognises the school for the purpose of granting its bursaries to students

The total tuition fees for the B D S are £225 and for the L D S £165 including in each case the fee for dental mechanics These fees include £35 for the first year preinedical course In addition there are incidental fees for the students' union, library &c amounting to about £35 for the B D S and £30 for the L D S The examination fees including the preinedical examination, amount to £20 for the B D S and £14 for the L D S There are three college hostels in Newcastle and students may

reside in any one of them at a cost of approximately £2 per week.

Students proceeding to the L.D.S. are required to conform to the preliminary requirements of the General Medical Council and candidates for the B.D.S. must also satisfy the matriculation requirements in the same manner as medical students in the University.

The higher degree of *Master of Dental Surgery* (M.D.S.) is open to bachelors of dental surgery of the University of not less than two years' standing who present a thesis embodying original work and research in some subject connected with dentistry. Candidates may also be required to present themselves for clinical, practical, oral, and/or written examinations

Sheffield University School of Dental Surgery

The school consists of a department of dental mechanics within the university, Western Bank, and departments of the faculty of medicine in which teaching of the preliminary medical subjects of biology, anatomy, and physiology is carried out; the clinical dental department is housed in the out-patients' block of the Sheffield Royal Hospital. The department of metallurgy is one of the foremost in the country and a special course is arranged for dental students Courses are primarily designed to meet the requirements for the Sheffield University degrees and diploma, but every opportunity is given to students reading for the degrees and diplomas of other licensing bodies All courses are open to men and women alike. The department of dental mechanics has been re-equipped and extended and the teaching reorganised under the supervision of a full-time qualified instructor and his assistants

Despite the fact that the number of entries to this school has almost doubled in the last few years, it still ranks as one of the smaller schools and is therefore able to offer greater facilities for individual tuition, and students are afforded the opportunity of familiarising themselves in the use of modern equipment and materials.

Clinical teaching is carried out under the supervision and direction of the professor of dental surgery and members of the honorary staff who attend the department daily. The close association and coöperation between this department and the medical, surgical, and special departments of the Royal Hospital is of extreme value in fostering the correct relationship between the dental surgeon and his medical colleague All branches of clinical dental surgery are included in the curriculum, including special instruction in radiology, local anæsthesia, general and prolonged anæsthesias, orthodontia, porcelain work, and oral surgery, while special courses for dental students are held in the subjects of medicine, surgery, pathology, and bacteriology, with specially arranged out-patient attendance and intensive practical courses

Hostel accommodation is available for men and women students, and a new Students' Union permits students to take part in the many social activities of university life.

SCOTTISH TEACHING INSTITUTIONS

Edinburgh Dental Hospital and School

The Edinburgh Dental Hospital and school, which is the second largest in the United Kingdom, offers special advantages to dental students. The general courses required for the dental diploma are taken in the school of medicine of the Royal Colleges and clinical instruction in medicine and surgery is taken at the Royal Infirmary. The school of medicine and the Royal Infirmary are within three minutes' walk of the Dental Hospital. The special courses are taken in the hospital. Instruction in dental hospital practice and in the mechanical laboratory affords a student ample opportunity for a full acquaintance with every branch of dentistry. The practice and lectures of the hospital are recognised by, and qualify for, all the licensing boards. Those students who desire to take a medical qualification in addition to the dental diploma have in this school admirable facilities for so doing The triple qualification of the Royal College of Physicians and Surgeons of Edinburgh and the Royal Faculty of Physicians and Surgeons of Glasgow is recommended. The combined courses (medical and dental), which are held concurrently, may be completed in a minimum time of six years The higher dental diploma (H.D.D.) of the Royal College of Surgeons affords an opportunity of obtaining a higher qualification subsequent to registration

Glasgow Dental Hospital and School

This hospital is located at 211, Renfrew-street, Glasgow. The school is open to men and women students and lectures are given on dental surgery, operative dental surgery, orthodontia, dental anatomy and physiology, dental histology, dental mechanics, crown and bridge work, dental metallurgy, dental bacteriology, radiology, anæsthetics, and dental materia medica Lectures on general subjects required for dentistry may be taken at the University or at one of the extramural schools where special provision is made for dental students The new Dental Hospital is now open and is equipped with all the modern methods for teaching students The Muirhead scholarship of £150 for one year enables a woman graduate to study for the higher dental diploma (H.D.D. Glasg), and the Muirhead bursary of £60 per annum for four years enables a woman student to obtain the L.D.S. of the Royal Faculty of Physicians and Surgeons, Glasgow. A Dall research scholarship is open to men and women

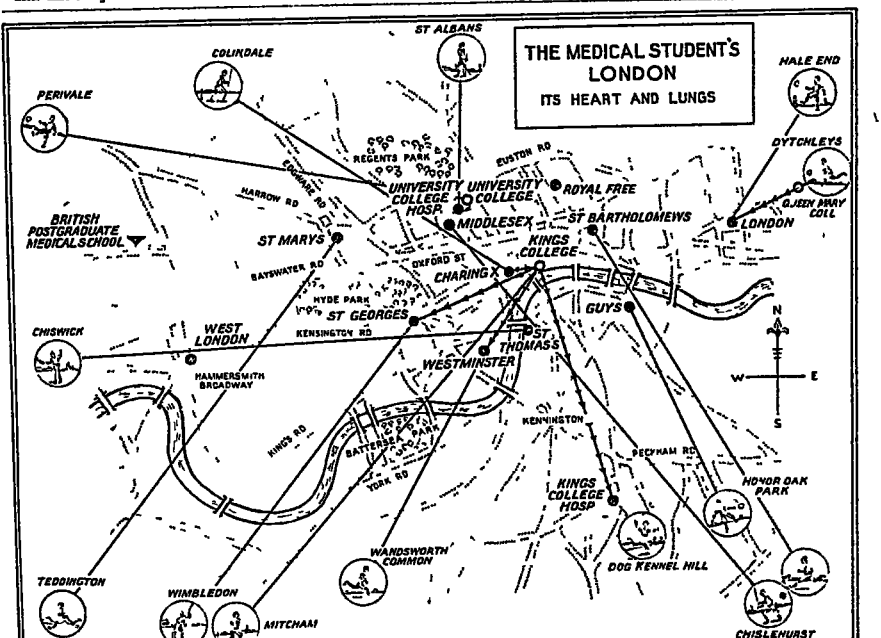
Glasgow Royal Infirmary Dental Department

The following course in the curriculum can be taken at St. Mungo's College: anatomy, six months; practical anatomy, nine months; physiology, six months; chemistry, six months; practical chemistry, three months; surgery, six months; medicine, six months; materia medica, three months Clinical medicine (three months) and clinical surgery (six months) are taken at the Royal Infirmary

IRISH TEACHING INSTITUTIONS

Dental Hospital of Ireland

All dental students, male or female, who have passed their second dental examination in the Royal College of Surgeons in Ireland (or an equivalent examination or examinations) are admissible to the clinical instruction of the hospital The winter session begins in September Clinical instruction is given daily by the visiting staff and demonstrators Lectures are given in the following subjects: dental surgery and pathology, mechanical dentistry and prosthetics, dental anatomy, dental materia medica, anæsthetics, and orthodontics. Practical dental mechanics can be taken in the hospital laboratory Post-graduate courses are given in orthodontics



This picture of the medical student's London would be incomplete without a reminder that for the purpose of clinical teaching the general hospitals of the London County Council are affiliated to the various schools as follows —

Council's Hospital	*Medical School*	*Council's Hospital*	*Medical School*
St Charles	Charing Cross	Hackney Bethnal Green	St Bartholomew's
St Alfege's St Mary Abbots St Olave's Lewisham	Guy's	St Mary Abbots	St George's
		Paddington	St. Mary's
		Lambeth	St. Thomas's
St Giles Dulwich	King's College	St Mary, Islington	University College
Archway	Middlesex	St Stephen's	Westminster
St. Mary, Islington Highgate St. Pancras	Royal Free		

In addition, undergraduates from certain medical schools are accepted at the Council's hospitals for instruction in obstetrics Resident students are accepted from St Thomas's at St James' Hospital, from the London at Mile End, from St Bart's at St Andrew's, from Middlesex at St Mary Abbots, and from St George's and King's at Lewisham Non resident students are accepted from Guy's at St Alfege's from St Bart's at St Giles's, from University College at St Mary, Islington, from King's at Dulwich and from St Mary's at Paddington Students from St George's attend the lecture demonstrations on mental disease at St Pancras All students in London do their course in fevers at one or other of the Council's hospitals, and demonstrations in the diagnosis and treatment of smallpox are also arranged by the Council

Sir THOMAS DUNHILL, surgeon to the King and consulting surgeon to St Bartholomew's Hospital, has been appointed sergeant surgeon to the King in succession to Prof Wilfred Trotter, F.R.S., who has retired

Mr G GORDON BULGI assistant surgeon to the Aberdeen Royal Infirmary, has been appointed to be one of the surgeons to the King in Scotland

COURSE IN ANÆSTHETICS.—A three weeks course in preparation for the diploma in anæsthetics will be held at Guy's Hospital medical school beginning on Oct 16 The course will include lectures in physiology, anatomy, pharmacology clinical investigations and anæsthetics Further particulars will be found in our advertisement columns

Surgeon Rear Admiral THOMAS CREASY has been appointed honorary physician to the King

The status of director of Royal Air Force Medical Services has been advanced to that of director-general with the rank of air marshal Air Vice-Marshal Sir ALBERT RICHARDSON, director of the medical service, was promoted air marshal at the beginning of this month and is now director general

Lieut.-Colonel and Brevet Colonel L T POOLE, assistant professor of pathology at the Army Medical College, Millbank, has been promoted colonel and appointed director and professor of pathology at the College in succession to Major-General J H F Ferry who is retiring

Medical Diary

Aug. 28 to Sept 2

EDINBURGH ROYAL INFIRMARY
THURSDAY—5 P.M., Lieut.-Colonel John Cunningham: Occupational Therapy (Honyman Gillespie lecture)

BRITISH POSTGRADUATE MEDICAL SCHOOL, Ducane Road, W.12
FRIDAY—2 P.M., clinico-pathological conference (obstetrics and gynæcology)
Daily, 10 A.M. to 4 P.M., medical clinics, surgical clinics and operations, obstetrical and gynæcological clinics and operations

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION, 1, Wimpole Street, W.1
MONDAY to SATURDAY—WEST END HOSPITAL FOR NERVOUS DISEASES, Regent's Park, N.W.1, Mon. and Fri., 8 P.M., lecture-demonstrations in neurological surgery—BROMPTON HOSPITAL, S.W.3, Tues. and Wed., 5.15 P.M., course in chest diseases

Appointments

BARTON, D., F.R.C.S.E., resident surgical officer at the General Hospital, Walsall
BROWN, J. M., M.B. Glasg., junior assistant medical officer at Prestwood Sanatorium
FITT, THOMAS, M.R.C.S., resident anæsthetist at the Royal Berkshire Hospital, Reading
MAXWELL, J. S., M.B. Edin., F.R.C.S.E., senior resident surgical officer at the Princess Margaret Rose Hospital for Crippled Children, Edinburgh
RUST, HELEN W., M.D. Rome, resident surgical officer at the Royal Children's Hospital, Manchester
SEDGWICK, F. S., M.B. Edin., junior resident surgical officer at the Princess Margaret Rose Hospital for Crippled Children, Edinburgh
SIDDONS, JOYCE R., M.R.C.S., resident medical officer at the Children's Hospital, Southampton
SLOT, GERALD, M.D. Lond., M.R.C.P., D.P.H., consulting physician to the Teddington Memorial Hospital
SPENCE, J. C., M.D. Durh., F.R.C.P., hon. physician to the Royal Victoria Infirmary, Newcastle-on-Tyne
TAYLOR, C. W., M.B. Birm., pathologist and bacteriologist at the Birmingham and Midland Hospital for Women
THOMAS, D. TREVOR, M.R.C.S., assistant resident medical officer at the Cardiff Isolation Hospital
TYTLER, JESSIE M. R., M.B. Glasg., assistant medical officer at the Royal Institution, Colchester
VICKERS, H. R., M.B. Sheff., M.R.C.P., hon. secondary dermatologist to the Royal Infirmary and Hospital, Sheffield
WOODHAM, C. W. B., M.R.C.S., D.M.R.E., radiotherapist to the East Suffolk and Ipswich Hospital

Vacancies

For further information refer to the advertisement columns

Abercrave Workmen Medical Committee—Medical practitioner
Aberdeen Royal Infirmary—Surg. reg., £200
Accrington Borough—Deputy M.O.H., £500
Barking Borough, Barking Hosp.—Res. M.O., £350
Bath, Royal United Hosp.—Hon. anæsthetist
Birmingham, Cantrell Hall Babies' Hosp.—Res. M.O., at rate of £250
Birmingham, St. Chad's Hosp.—H.P. and anæsthetist, at rate of £150
Brighton, Royal Sussex County Hosp.—Two H.S.'s, £150
British Postgraduate Medical School, Ducane Road, W.12—Asst. in morbid anatomy in dept. of pathology, £300. Three demonstratorships in clinical medicine, each £150. Also two H.S.'s, each at rate of £105
Castleford Urban District Council—M.O.H., £800
Derbyshire County Council—Temp. Asst. M.O., at rate of £500
Dreadnought Hosp., Greenwich, S.E.10—H.P. and H.S., each at rate of £110
Durham County Council, Seaham Hall Sanatorium for Women and Girls, Seaham Harbour—Jun. res. M.O., £200
Erith Borough—Asst. M.O.H. and asst. school M.O., £500
Exeter, Royal Devon and Exeter Hosp.—Three H.S.'s and one H.P., each at rate of £150
Gloucester Royal Infirmary—H.S. to ear, nose, and throat dept. at rate of £170
Great Barrow, Chester, Barrowmore Hall Sanatorium—Jun. asst. M.O., £200
Guildford, Royal Surrey County Hosp.—H.P. and cas. O., £150

Prince of Wales's General Hosp., N.15—Res. jun. H.P. and H.S.'s, each at rate of £90
Princess Elizabeth of York Hosp. for Children, Shadwell, E.1—H.P., at rate of £125
Queen's Hosp. for Children, Hackney Road, E.2—H.P. and ear, nose, and throat H.S., each at rate of £100. Dental surgeon, £1 7s. 3d. per session. Also physician for whooping-cough clinic, 1 guinea per attendance
Queen Mary's Hosp. for the East End, Stratford, E.15—Res. M.O. and cas. O., each at rate of £150. H.S. and H.P., each at rate of £120. Also obstet. H.S., at rate of £110–£130
Radcliffe-on-Trent, Notts County Mental Hosp.—Second asst. M.O., £459
Radium Institute, Riding House Street, W.1—Res. M.O., at rate of £250
Rainhill, Lancs, County Mental Hosp.—Second and third asst. M.O., £700 and £650 respectively
Richmond, Surrey, Royal Hosp.—Jun. H.S., £100
Rotherham County Borough—Asst. M.O.H., £600
Royal Cancer Hosp., Fulham Road, S.W.3—Res. H.S. to radium dept. and H.S., each at rate of £100
Royal Naval Medical Service—Medical officers
Runwell Hosp., near Wickford, Essex—Sen. res. physician, £576
St. John's Hosp., Lewisham, S.E.13—Res. surg. O., £200
Salford Royal Hosp.—Res. surg. O., £200. Also H.P., two H.S.'s, and cas. H.S., each at rate of £125
Samaritan Free Hosp. for Women, Marylebone Road, N.W.1—H.S., at rate of £100.
Sheffield Children's Hosp.—H.P., at rate of £100
Sheffield, Jessop Hosp. for Women—Res. M.O., at rate of £150
Stoke-on-Trent City—Asst. M.O. for maternity and child welfare, £500
Stoke-on-Trent, London Road Hosp.—Sen. res. asst. M.O., £350
Stourbridge (near), Wordsley Public Assistance Institution—Asst. M.O., at rate of £300
Swansea County Borough—Asst. M.O., £500
Union of South Africa, Dept. of Public Health—Dietitian, £250
West Ham County Borough—Two res. M.O.'s at Whipps Cross Hosp., £350
West London Hosp., Hammersmith, W.6—H.P. and H.S., each at rate of £100. Also genito-urinary surgeon
Westmorland County Council—County M.O.H., £800
Wigan, Royal Albert Edward Infirmary—Pathologist and bacteriologist, £500
Windsor, King Edward VII. Hosp.—H.S., £120
Wolverhampton County Borough—Temp. asst. M.O.H., £600
Wolverhampton, New Cross Hosp.—Asst. M.O., £200
Woolwich and District Hosp. Assn., Shooters Hill, S.E.18—H.S. and cas. O., at rate of £100
The Chief Inspector of Factories announces a vacancy for an examining surgeon at Shefford, Beds

Births, Marriages and Deaths

BIRTHS

MITCHELL HEGGS—On Aug. 15, at Welbeck Street, W.1, the wife of Dr. G. B. Mitchell Heggs—a son
MURRAY—On Aug. 13, the wife of Dr. Francis Murray, of Tressillian Road, S.E.4—a daughter
POSFORD—On Aug. 20, the wife of Dr. Peter Posford, of Sanderstead, Surrey—a daughter
PURVIS—On Aug. 17, at Archers Road, Southampton, the wife of Mr. Raymond Purvis, F.R.C.S.—a son
SHARP—On July 23, at Shiraz, Iran, to Dr. Barbara Sharp (née Carden), wife of Rev. R. N. Sharp—a son

MARRIAGES

FOSTER—MOUBRAY—On Aug. 10, at St. Columba's Church, Aberdour, Fife, Surgeon Lieut.-Commander Samuel Kingsley Foster, to Barbara Moubray
STEDMAN—DIPPLE—On Aug. 16, at Langleybury Parish Church, Herman Stedman, F.R.C.S.E., of Iver Heath, Bucks, to Louisa Jenevera Dipple

DEATHS

CHETWOOD-AIKEN—On Aug. 17, at Calenick, Wood Lane, Falmouth, Knightley Chetwode Chetwood-Aiken, M.B. Aberd., late of Truro and Taunton, aged 68
PERCIVAL—On Aug. 20, at Kingsley Road, Northampton, George Henry Percival, O.B.E., M.B. Lond., aged 91
WILLIAMS—On Aug. 20, in London, Leonard Williams, M.D. Glasg., editor of the *Medical Press and Circular* (1916–18)

N.B.—A fee of 7s. 6d. is charged for the announcement of Births, Marriages, and Deaths

ADDRESSES AND ORIGINAL ARTICLES

TRAUMA AND PROGRESSIVE MUSCULAR ATROPHY

By J W Aldren Turner, B M Oxfd, M R C P

RESIDENT MEDICAL OFFICER AT THE NATIONAL HOSPITAL, QUEEN SQUARE LONDON

THE part played by trauma in the initiation of progressive generalised nervous diseases becomes occasionally subject to dispute in relation to workmen's compensation In view of the lack of data derived from any notable series of cases, it seems worth while to analyse a series of cases of progressive muscular atrophy to find out in what proportion a history of trauma is obtained. The term progressive muscular atrophy has been taken to include amyotrophic lateral sclerosis and progressive bulbar palsy with muscular atrophy

For this purpose a series of 100 consecutive cases of progressive muscular atrophy treated in the National Hospital between 1932 and 1937 has been selected The following criteria were adopted for the diagnosis —

(1) Signs of progressive degeneration of the bulbar nuclei associated with generalised muscular atrophy and fibrillation either with or without evidence of involvement of the pyramidal tracts (37 cases)

(2) Progressive muscular wasting associated with evidence of involvement of the pyramidal tract (40 cases)

(3) Widespread muscular wasting and fibrillation of the classical type of progressive muscular atrophy without involvement of the pyramidal tract (19 cases) There was no sensory impairment in any of the cases in these groups

(4) Post mortem confirmation of the diagnosis The pathological changes taken as confirmatory were degeneration of the anterior-horn cells, diffuse degeneration of the anterolateral tracts with the pyramidal tracts most affected, and degenerative changes in the Betz cells of the precentral convolution (4 cases)

Especial care has been taken to exclude cases such as those described by Walshe and Ross (1936), in which rather a similar condition has been caused by a local lesion in the cervical cord following an injury to the head The main features of these cases distinguishing them from progressive muscular atrophy are the inversion of the radial reflexes and pain on movement of the neck

Of the 100 patients 66 were males and 34 females, in the following age groups twenty–thirty, 4, thirty–forty, 11, forty–fifty, 30, fifty–sixty, 39, and sixty–seventy, 16 In 79 cases no history of trauma was obtained, whereas in the other 21 there was a history of trauma The relation of trauma to the onset of nervous symptoms seemed to fall into two categories trauma more than a year before the first symptom was noticed, and trauma within a year In the first group there were 15 cases, the trauma usually being many years before and varying greatly in severity, but usually being a fracture or a wound of a limb In the second group there were 6 cases, in 1 of which the trauma was merely a sprained ankle, of the other 5 more detailed clinical notes will be given

As a control a second series of cases was analysed. These were 100 cases of the same age groups and sex groups suffering from various organic diseases of the nervous system in which trauma is not thought to play an aetiological part In this series a history of trauma was obtained in 22 cases, the injury being more than a year before the first symptom was noticed in 20 cases In the remaining 2 cases a slight trauma preceded by a few months the first symptom of a cerebral tumour in one case and of a spinal tumour in the other

TABLE I—INCIDENCE OF TRAUMA

—	No trauma	Trauma		
		Under 1 year	Over 1 year	Total
P M A group (per cent)	79	6	15	21
Control group (per cent)	78	2	20	22

Table I shows the relative frequency of trauma in the history of 100 consecutive cases of progressive muscular atrophy and of 100 cases of other nervous diseases as a control It will be observed that in both the progressive muscular atrophy and the control series the total number of cases with a history of trauma was practically identical, and that it was only when an arbitrary period of a year was taken that a small difference of 4 per cent in favour of the progressive muscular atrophy group was apparent

CASE RECORDS

A few details will now be given of the 5 cases in which there was an injury within twelve months of the first symptoms They are summarised in table II

TABLE II—TYPE OF INJURY AND INTERVAL BEFORE DEVELOPMENT OF SYMPTOMS

Case	Trauma	Part first affected	Interval between trauma and first symptoms
1	Fall on to right shoulder	Right shoulder	1–2 weeks
2	Frostbite of left hand	Left hand	About 1 week
3	Two cerebral injuries	Right arm and leg	Nine months after first injury and immediately after second injury
4	Injury to right knee causing synovitis	Right leg	One month
5	Crushing injury to left hand	Left hand	Twelve months

CASE 1 —A male, aged 53, admitted on March 31 1937, under the care of Dr George Riddoch Eight months before admission, when mounting his bicycle he caught his foot in the pedal and pitched forward on to his right shoulder tip The right arm was painful and stiff and remained so for several days Then, as the pain wore off, he noticed that the right arm was weak at the shoulder, and about a fortnight later the elbow was weak and in the course of the next two months the weakness increased and involved the whole arm A month after the injury he noticed flickering in the muscles of the right hand, which seemed to be thinner Rapidly the weakness spread to all four limbs and two months before admission he became unable to walk and his voice became feeble

On examination his voice was feeble, but articulation was normal, and there was no fibrillation of the tongue There was wasting of all the muscles of both arms with fibrillation in the pectoral muscles He had no power in the upper limbs beyond weak adduction of the arms and flexion of the wrists and fingers There was gross wasting of all the leg muscles

with practically no voluntary power. All the tendon-jerks were very weak or absent, and the abdominal reflexes were absent and the plantar reflexes flexor.

He died of bronchopneumonia a few days after admission. Necropsy showed the typical degeneration of the anterior-horn cells, especially in the cervical and lumbar enlargements, and somewhat diffuse degeneration of the anterolateral columns, with special incidence on the pyramidal tracts.

This was a rapidly developing progressive muscular atrophy with post-mortem confirmation of the diagnosis. The injury which preceded the onset of symptoms by a month is most unlikely to have been due to pre-existing disease, for his fall resulted from catching his foot in the pedal of his bicycle, and weakness of the legs was not complained of till some months later, the first signs of disease appearing in the arms

CASE 2.—A male, aged 47, admitted on April 3, 1935, under the care of Dr. E A. Carmichael. In March, 1934, thirteen months before admission, he was handling some frozen cable, when his left hand became frostbitten; this consisted of swelling of the hand, which persisted for two or three days. When the swelling wore off, he found that the left hand was weak. Slowly the weakness spread to the rest of the arm, which became stiff Five months later he began to speak through his nose, and swallowing became difficult. Four months after the onset of bulbar symptoms his right grip became weak and his legs became weak and stiff.

On examination there was impairment of emotional control, and he had a slurring nasal dysarthria and slight weakness of the orbicularis oculi and oris muscles There was wasting and fibrillation of the tongue There was wasting, weakness, and fibrillation in the arms, more noticeable on the left. The legs were slightly spastic, and there was fibrillation in the quadriceps muscles. The tendon-jerks were increased, the abdominal reflexes present, and the plantar reflexes extensor There was no sensory loss The cerebrospinal fluid was normal.

This was a typical amyotrophic lateral sclerosis with bulbar palsy. It is conceivable in this case that the frostbite of the left hand was due to clumsiness of movement of the hand, resulting from pre-existing disease, but it is impossible to be sure on this point

CASE 3.—A male, aged 46, admitted on July 10, 1934, under the care of Dr. Hinds Howell. Eighteen months before admission he fell down sixteen stone steps and was unconscious for half an hour; immediately afterwards he had an aching pain in the right shoulder and hip, some tremor of the right leg, severe weakness of the right arm and leg, and retention of urine for a week after the accident. The power in the arm and leg gradually returned, but the pains persisted

Nine months later he was involved in a car smash and was unconscious for five minutes The next morning his right arm and leg were very weak and he could not walk. Since then he has not been able to walk without support and he has noticed slight weakness of the left arm and pain in the left shoulder.

On examination nine months after this second injury he was found to have increased tone in both arms, wasting of the first dorsal interosseous muscle in both hands, and fibrillation in both deltoid, biceps, and triceps muscles Both legs were spastic, and there was fibrillation in the calf muscles There was definite weakness of all movements of arms and legs, the right side being the weaker. All the tendon-reflexes were increased, the abdominal reflexes absent, and the plantars extensor There was no sensory loss. The cerebrospinal fluid and radiograms of the spine were normal.

This man presented a typical picture of amyotrophic lateral sclerosis with no evidence of a local lesion in the spinal cord. It appears likely that there was cerebral damage from each of the preceding injuries, for there was transient loss of consciousness and weakness of hemiplegic distribution on the right side. In this respect this case differs from the others, in which the injuries were to a limb The question of the injuries being due to pre-existing disease of the limbs does not seem to arise in this case.

CASE 4.—A male, aged 42, admitted on July 10, 1935, under the care of Dr. Kinnier Wilson In July, 1933, two years before admission, he tripped over a wooden post, which was lying on the ground, and he went sprawling into the road. He had severe pain in the right knee, but he was able to continue his round as a milkman. A few hours later the right knee became swollen and very painful, and the swelling took seven to ten days to subside. He was off work for a month.

A month later, when walking, he found that his right foot was dragging, and the leg felt weak. The next day it felt normal again, but about two months afterwards the right leg again felt weak, and he dragged it when he walked, and since then the weakness has gradually increased. A few weeks later the left leg began to feel weak, and he became conscious of fibrillation in both thighs and occasionally in the arms. The weakness of the legs was steadily progressive.

In July, 1935, on examination the cranial nerves and arms were normal There was ½ in. wasting of the right calf, and there was fibrillation in both calves. Both legs were spastic, and there was generalised weakness of the legs, greater on the right. The tendon-jerks of the arms and legs were exaggerated, the abdominal reflexes present, and the plantars extensor There was no sensory loss. The cerebrospinal fluid was normal.

This was a gradually progressive amyotrophic lateral sclerosis with the lower limbs more involved than the upper. An injury to the right leg causing synovitis of the knee preceded the onset of slight weakness of this leg by about a month No weakness of the legs of any kind had been noticed before he tripped over the wooden post.

CASE 5.—A female, aged 61, admitted on March 17, 1936, under the care of Dr. Hinds Howell Early in 1931 the inner three fingers of her left hand were crushed by machinery, the fingers swelled, and the nails dropped off. Three weeks later she returned to work, but she could not use the left hand. The hand gradually became normal, and after a few weeks she could use it normally. A year later, in 1932, she found that she could not move her left hand as quickly as she could before, and the fingers began to be drawn up into the palm During the next two years the left hand gradually became thinner and weaker.

Eighteen months before admission she fell and fractured her left wrist, and six months later she again fell and broke her left upper arm. During the last nine months both her arms and legs have gradually become weaker, so that on admission she could not walk.

On examination about five and a half years after the original injury the cranial nerves were normal. There was considerable wasting of the left hand and moderate wasting of the left deltoid, spinati, and forearm muscles, with complete loss of power in the left hand and weakness of the movements of the left arm and the right wrist and hand. No fibrillation was seen. Both legs were slightly spastic, and there was weakness of flexion of the thighs. The tendon-jerks were reduced in the left arm and normal in the right arm, the knee-jerks increased, and the ankle-jerks normal. Abdominal reflexes were absent and plantars indefinite. There was no sensory loss. The cerebrospinal fluid was normal.

This was a slowly developing progressive muscular atrophy, with only slight signs of involvement of the pyramidal tract. The fact that the weakness of the left hand, which followed the injury, cleared up

completely in a few weeks, and that there was then an interval of several months before progressive weakness and wasting of the hand developed, disposes of any suggestion that the accident was due to pre-existing disease

DISCUSSION

Trauma has from time to time been suggested as a possible cause of progressive muscular atrophy. Of the older authors, Gowers (1892) accepted it, saying that concussion of the spine rather than injury of a limb was more likely to cause it, and Bailey (1908), who reviewed the whole subject of injury and nervous disease, said: "The causal relationship of trauma to progressive muscular atrophy is fairly well established. A considerable number of cases are on record in which an injury of a limb was quickly followed by an atrophy of its muscles, a condition which later became generalised."

More recently Harris (1933) has been the chief exponent of the view that trauma may play some part in the aetiology, and he quoted the case of a man who shortly after a 500 lb. case had fallen on to his right foot developed muscular atrophy of the right foot and leg, which later became generalised and was accompanied by widespread fibrillation. Harris said: "Grave injustice is often done by the refusal of consultants to allow the possibility of cause and effect in progressive nervous disease following severe blows upon the head or spine." At a recent discussion at the Royal Society of Medicine (1938) several speakers agreed with this point of view.

Of those opposed to this view Kinnier Wilson (1923) is the most dogmatic, summing up with the words "I am unable to understand how a single trauma can cause a progressive neural degeneration or abiotrophy." Pollock (1937) in a recent review says that he thinks that the causal relationship of trauma and progressive muscular atrophy is most unlikely. Alajouanine, Gopcevitch, and Meilland (1930), in an account of the types of muscular atrophy which may follow trauma, do not mention progressive muscular atrophy, discussing only localised atrophy, hæmatomyelia, and myopathy.

The fullest account of the subject is by Jelliffe (1935), who collected all the cases reported up to that date, without giving any opinion on them. Of his cases 42 can probably be accepted as instances of true progressive muscular atrophy, and the most significant fact is that the injury was inflicted within a year of the first symptom in 40 of the cases. Since then only 3 cases have been reported. In one of these atrophy confined to the right arm, but with more extensive fibrillation, was noted 42 years after an injury to the left side of the head (Sutton 1938), and of the others (Geyer 1934) one started within a year of the injury and the other was rather an anomalous case with acute poliomyelitis as well as trauma in the history.

The evidence derived from the present inquiry shows that in the great majority of cases there is no question of trauma in the etiology of progressive muscular atrophy, and, when the control series of cases is considered, it is obvious that an injury several years before the first symptoms appear can also be discounted as a causal factor. The only difference in the incidence in the two series of cases appears when trauma inflicted within a year of the first symptom is considered. Even here the difference is only 4 per cent. and clearly so small a difference as this might arise by chance and cannot be considered as statistically significant. From these figures it must be concluded that trauma can play no primary part in the aetiology of progressive muscular atrophy.

In the 5 case records quoted, however, an injury preceded by a short interval the first symptoms, and in 4 of these cases the injured limb was the first part of the body to be affected. An objection commonly raised in cases of this sort is that the injury was really the result of the disease and served to draw attention to the symptoms, and it is often a matter of considerable difficulty to be sure about this point. I have considered this in the comments on each case, and real doubt about pre-existing disease is only present in case 2. These cases suggest that trauma, though not the cause of progressive muscular atrophy, may in a very small minority of cases act as a precipitating factor in the development of the disease, and that, when this happens, the first signs are likely to appear in the limb which has been injured.

SUMMARY

(1) An analysis has been made of 100 cases of progressive muscular atrophy and of a control group of 100 cases of other organic nervous diseases with regard to trauma as a possible aetiological factor.

(2) In 5 of the cases of progressive muscular atrophy there was a history of injury within a year of the first symptom, and in 3 of these the injury was within a month of it. Details of these cases are given.

(3) It is concluded that trauma plays no primary part in the causation of the disease, but in a very small minority of cases it seems to precipitate the appearance of symptoms.

My thanks are due to the medical committee of the National Hospital, Queen Square, for permission to report these cases, and to Dr. D. E. Denny-Brown for help in the preparation of the paper.

"People of this constitution may be said to live perpetually in a state of hate, for so long as aggressiveness is thwarted, i.e., so long as the position falls short of absolute power, hatred will be favoured constantly, even where no object for the hatred existing can well be found. In those rare instances where the external resistance is overcome, where absolute power is attained and day-dreams achieved, the hatred will persist as a habit and find still more vague and more remote objects, but it will tend gradually to be supplanted as the prevailing emotion, by fear. For we all picture the world in terms of our own mentality, and an aggressive person peoples his environment with similarly aggressive people so that the fear of those around him is in direct proportion to the quantity of his own aggressiveness. Where the external resistance is real it can be calculated and so the fear is limited; but when it has been overcome, the habit of fear remains like the habit of hate, and the hate and the fear become all the greater because these objects are now diffuse and incalculable. Fear of the unknown as everyone knows is greater than fear of the known; thus the price of absolute dominion is a state of heightened vindictiveness and fear."—Dr. R. D. GILLESPIE: *The Psychology of Dictatorship*, *Catholic Medical Guardian*, July 1939, p. 12.

TREATMENT OF FRACTURES BY LOCAL ANÆSTHESIA

By H. CULLUMBINE, M.B., M.Sc. Sheff.

CLINICAL ASSISTANT IN THE ORTHOPÆDIC DEPARTMENT AT THE DEWSBURY AND DISTRICT GENERAL INFIRMARY.

Leriche (1928, 1936), Fontaine (1936), and Campbell (1938a and b) have described the use of local anæsthesia in the treatment of fractures. This paper records the results of 100 consecutive cases of "minor" fractures treated by their methods. By the term "minor" fracture I mean a fracture in which there is no displacement and no possibility of displacement during the normal functional activity of the part in question. Every incomplete fracture has, therefore, been thus treated. In addition, however, complete fractures in certain situations—e.g., internal and external malleoli, phalanges, and base of the fifth metatarsal—have been included.

Too often, in the past, fractures have been treated by routine methods which took into account only the site and not the degree of the injury. In the enthusiasm to adopt Böhler's methods his basic principle of "functional activity during treatment" has been forgotten. Böhler reasoned that the more the injured limb was used, the quicker and the better was the callus formed, and muscular atrophy and stiffness were reduced to a minimum. How much better, then, that the fractured bone should be used throughout its normal range of movement, unrestricted by splints or plaster.

METHOD

After thorough sterilisation of the skin, a 2 per cent. solution of procaine is injected into the hæmatoma between and around the fractured ends of the bone. The affected area is massaged to ensure the thorough dissemination of the procaine. The patient is then told to use his limb throughout its full range of movement. Supporting strapping is only used when there is excessive œdema in fractures of the ankle and in "second"-degree fractures of the ankle. The amount of procaine used varies with the site of injection—e.g., 5–10 c.cm. around the ankle, 2–3 c.cm. in fractures of metatarsal and metacarpal bones, and 0·5–1 c.cm. in fractures of phalanges.

RESULTS

The following types of fracture were thus treated.—

Ankle fractures.—Of 33 fractures of the ankle 20 involved the external malleolus, 5 the internal malleolus (in 8 of these 25 the opposite lateral ligament was also involved), 4 the internal and external malleolus, and 2 the posterior malleolus. The remaining 2 were trimalleolar.

Campbell (1938a and b) confined his treatment to "first-degree" fractures of the ankle—*i.e.*, fractures of one malleolus only. Here the scope has been extended to "second-degree" fractures—*i.e.*, fractures of both malleoli or fracture of one malleolus with involvement of the opposite lateral ligament of the ankle. In these cases the tender area on each side of the joint was injected. These "second-degree" fractures are, however, strapped for two weeks after the injection, because in these cases the ankle-joint is unstable. Similar treatment was given to 2 cases of trimalleolar fracture—*i.e.*, fracture of the internal and external malleoli with fracture of the posterior articular surface of the tibia.

Of the 33 cases of fracture of the ankle thus treated only 4 needed a further injection because of subsequent pain. No case needed more than two injections. All the patients were made to walk immediately after the injection. Their confidence being thus gained, they were told to continue active movement throughout the treatment. Subsequent radiographic control at the end of six weeks seems to suggest that more callus was formed than with the usual methods of immobilisation.

The old bugbear of "stiff ankle," so often seen in the treatment with plaster, was non-existent. The length of treatment was reduced, for every one of the 33 patients had resumed normal working activity within six weeks of injection—most in much less time, and one, on his own initiative, within three weeks. It would be wrong to say that the full range of movement was obtained in all cases immediately after injection. In those with little evidence of local trauma to the tissues—i.e., without œdema or bruising of the soft parts—this was possible, but in those with considerable œdema or much extravasation some awkwardness of gait and stiffness of movement could be expected for the first seven to ten days.

Metatarsals.—Of 13 fractures 9 involved the fifth metatarsal, 2 the fourth, and 2 the second. These were injected from the dorsum of the foot. Of the 9 fractures of the fifth metatarsal 6 were complete. The fractures of the fourth and second metatarsals were incomplete. Of the 13 patients 12 were back at their normal work within three weeks; the thirteenth needed a second injection a week after the first and was off work for five weeks. No deformity—e.g., flat-foot—has yet developed in any of the cases. Complete fractures of bones other than the fifth metatarsal have not been injected, because of the danger of such deformity if no supporting splint were applied.

Phalanges.—Of 27 fractures 16 involved fingers and 11 toes. Of these 27 fractures 7 were complete, and crepitus could be elicited. Perhaps the close binding of the soft tissues round the bones of the phalanges prevents any gross displacement during normal movement, despite the tendency to anterior angulation from the action of the lumbricals and the interossei muscles or of the long flexor tendons. Whatever the explanation, normal union in good position was obtained in all cases. In complete fractures each side of the phalanx was injected.

Metacarpals.—There were 2 cases, 1 involving the second and third metacarpals and 1 the second metacarpal. These were incomplete fractures, and both patients were back at work within three weeks. Complete fractures could not be so treated, because of the danger of displacement by the interossei muscles.

Ribs.—Cracked ribs (8 cases) were injected over the point of maximal tenderness. There was no subsequent pain, and complete union resulted in all cases.

Coccyx.—There were 2 cases, without displacement, and no pain or disability resulted after treatment.

Fibula.—There were 7 fractures of the head or shaft. All the patients resumed work immediately, and full union was obtained.

Spinous processes.—There were 2 cases, and both patients resumed work immediately. Here the close ligamentous and muscular attachment would prevent any possibility of displacement.

Great trochanter of the femur.—There were 2 cases, both incomplete cracks with pain on walking. All pain and disability vanished immediately after injection.

Cuneiform bone.—There were 2 fractures of the first cuneiform. Both patients returned to work immediately.

Os calcis.—There were 2 cases of incomplete crack across the body of the os calcis. The severe pain, which had prevented the patients from putting their heels to the floor, disappeared immediately after injection. They were at work again in two weeks with no subsequent disability.

COMMENTS

These results of the treatment of 100 consecutive cases of "minor" fracture seem to justify a more widespread use of local anæsthesia in the treatment of fractures. Not only are the pain and the disability quickly relieved, but also a more rapid return to normal functional activity is achieved.

It may be reasoned that there is always a danger of displacement. This has not happened in any of these cases. Moreover, it should be borne in mind that, besides their normal kinetic activity, the muscles of the body have a postural function which helps to bind and keep the bones in their definite form.

There is also an important psychological factor to be considered in the treatment outlined. To the normal lay patient a fractured limb is a limb that should not be used. He views with great suspicion any efforts to persuade him to the contrary. For example, a patient with a fractured ankle, after injection, puts his foot to the ground with great trepidation. When told to walk he does so with a stiff ankle and a stiff knee. We have usually, therefore, to spend ten minutes re-educating the patient in the difficult art of walking.

In about a third of the cases "after-pains" (Leriche) occurred about twenty-four hours after the injection. They usually lasted for about twenty-four hours and then disappeared altogether. These "after-pains" were, in many cases, more severe than the original pain, and so, as a routine, we now warn the patient that they may follow. Further, although all pain has disappeared, it is usually possible to elicit some tenderness over the site of the fracture for 10–14 days after the injection.

SPRAINS

It may also be of interest that, during the period covered by the above cases, I treated 30 cases of "sprain" by the same method. The results are summarised below.—

Supraspinatus tendinitis.—In 5 cases 10 c.cm. of a 2 per cent. solution of procaine was injected over the point of maximal tenderness—i.e., the great tuberosity of the humerus. The average period of disability was six days.

Sprains round the ankle.—In 11 cases 10 c.cm. of a 2 per cent. solution of procaine was injected into the point of maximal tenderness. The period "off work" varied from seven to seventeen days. One patient was hurt playing rugby on a Saturday. He was injected on the following Monday and played again without any ill effects the following Saturday.

Sprains round the knee.—In 14 cases 5–10 c.cm. of a 2 per cent. solution of procaine was injected into the painful area. The period "off work" varied from ten to twenty-one days.

SUMMARY

The results of treatment of 100 consecutive cases of minor fracture by local anæsthesia are reported. Pain and disability were quickly relieved and normal function returned more rapidly than it does with other treatment. No displacement followed. In about a third of the cases there were "after-pains" some twenty-four hours after the injection of procaine. Although all pain disappeared, it was usually possible to elicit tenderness over the site of fracture for 10–14 days after the injection.

Local anæsthesia was also used successfully in the treatment of 30 cases of sprain.

I am indebted to Mr. A. B. Pain, honorary orthopædic surgeon to the Dewsbury and District General Infirmary, for permission to publish the above results.

URETHRAL OBSTRUCTION FOLLOWING PROSTATECTOMY

BY STEPHEN POWER, M.S. Lond., F.R.C.S.

CONSULTING SURGEON TO THE ELTHAM HOSPITAL; ASSISTANT SURGEON TO THE LONDON HOMŒOPATHIC HOSPITAL

OBSTRUCTION following prostatectomy is a complication which has received a good deal of attention in the past, but I am not sure that its ætiology has excited as much interest as its prophylaxis. The mechanism of the obstruction seems to have been taken for granted, and certain facts in regard to it have not been given their full significance.

Thomson Walker's name is outstandingly associated with this complication of prostatectomy, indeed the operation which he designed and practised was expressly planned to forestall it. He published a long series of cases in 1927 and an even longer in 1930 (the latter including the former). The second of these amounted to 75, but included examples of recurrent obstruction from such things as tags, adenomatous nodules which had been overlooked, and adenomatous nodules which had re-formed. For the purpose of the present argument these cases can be disregarded, anyway they represent only a small fraction of the whole series. The cases that concern us are those of true narrowing of the bladder outlet, and it is obvious at once on looking at the list that these can be divided into cases of narrowing at the internal meatus and cases of narrowing in the prostatic bed. The striking thing about this combined group is that the first are far more numerous than the second, the proportions being somewhat as follows, meatal narrowing 85 per cent. and prostatic bed narrowing 4·3 per cent. In 7 cases the outlet was completely obliterated and there were false passages behind it. There was a permanent fistula in 4·3 per cent., and the remainder complained of frequency, dysuria, and recurrent attacks of retention. Usually the trouble had begun during convalescence from the prostatectomy.

In 39 cases the type of prostate removed was ascertained. Of these 17 were fibrous, 3 contained calculi, and 19 were adenomatous, no distinction is made in the last group between the intravesical and subvesical types of enlargement. Thomson Walker remarks that the technique employed was always "blind." The causes which he gives as partly responsible are incomplete removal and sepsis. He was dubious about the Harris technique as a possible solution of the problem. None of the

cases appear to have been in the first place his own, and he apparently considered his own operation immune from this complication

As to treatment, he counselled urethral dilatation if possible but found very often that the hardness of the fibrous tissue made it difficult, dangerous, and unsatisfactory. In particular he was afraid of creating false passages through the trigone, because he realised that the meatus was as a rule drawn well forwards; to avoid this he advised that the point of any instrument should be kept well forward under the pubic arch until it had entered the bladder.

Thomson-Walker's prostatectomy was deliberately planned to obviate any subsequent narrowing, and the method adopted was the excision of a wedge from the shelf which bounds the meatus posteriorly after the gland has been shelled out. This amounted to a division of the sphincter vesicæ, although this aspect of the matter was not emphasised Faced with a postoperative meatal narrowing he carried out practically the same procedure, which he had proved to be such a useful adjunct to an ordinary prostatectomy. Always at operation he was impressed by the absence of any fibrosis in the anterior segment of the bladder neck as contrasted with the hard and thickened ridge posteriorly. He used a catheter as a routine both after prostatectomy and after restoration of the urethra

Riches and Muir in 1933 investigated the possibility of anticipating from the nature of the enlarged prostate what the results of its removal might be For this purpose they divided their prostates (114 cases) into glandular, intermediate, fibrous, and calculous types; unfortunately the first two groups were far larger than the second two. Results were classified as good, bad, or indifferent The bad results were mainly attributable to sepsis and stenosis at the internal meatus Stenosis was found far more commonly in the fibrous and calculous types than in the others It is clear, however, that a distinction was not made between stenosis at the internal meatus and stenosis in the prostatic bed, for the authors say that the complication may be considered "an inevitable result of the impossibility of removing all the fibrous tissue which commonly extends throughout the prostatic urethra in the fibrous type and the impossibility of taking away all the gland in the calculous type" This shows that at least in some cases the stenosis was not at the internal meatus

Emmett (1937) throws some sidelights on this question of postoperative stenosis in an account of diathermy resection carried out for persistent or recurrent symptoms after prostatectomy. Causes he lists as infection, scarring, incomplete removal, and carcinoma, and he points out that, although in nearly half his cases a fistula had persisted from the time of the first operation, in others the recurrence of trouble was delayed for as long as eight years. He met with the most bizarre deformities and angulations in the posterior urethra but was impressed by the frequency of an elevation of the posterior vesical lip, resembling in appearance a high median bar. Naturally he was more interested in the condition he had to deal with than with its possible causation, but he hazarded the observation that, although a skilled surgeon was unlikely to leave nodules behind, his cases seemed as liable to stenotic complications as those of his less experienced colleague

What other information I have been able to collect on this matter tends to be ambiguous where it is not actually contradictory. It refers mainly to the sequelæ of prostatectomy when the gland is hard and fibrous, and the general impression is that the danger is greatest when the vesicoprostatic opening is narrow from the start—i e, when the enlargement is subvesical, as it always is when the gland is fibrous.

CASE-RECORDS

Here is a summary of some cases I have seen myself.

CASE 1.—An elderly man, who some ten years previously had undergone prostatectomy and had never passed water in the natural way since then, came to me wearing an apparatus and with every evidence of a foul cystitis. I removed from his bladder, which was almost filled by it, one of the largest stones I have come across. The prostatic urethra was occluded by a fibrous sheet through which the head of a sound, passed down the penile urethra, could easily be felt. He had expressly forbidden any interference with this obstruction.

CASE 2.—I saw in consultation a man whose prostate had been removed three or four weeks previously, since when he had failed to pass any water. Neither his surgeon nor I could succeed in catheterising him. At the second operation his internal meatus was found to be completely closed, despite the fact that so recently a sizable prostate had been removed through it. At that time it had admitted two fingers; when I saw it it was represented only by a dimple. By cutting down on a bougie and excising the greatly thickened posterior lip of the orifice the obstruction was removed, and the man has had no trouble since.

CASE 3.—This patient had had prostatectomy three years previously but of late all his symptoms had recurred. He had already been seen by another surgeon, who had dilated him and warned him that he might need electrical removal of tissue. When I saw him, no instrument would pass No abnormality was detected per rectum. Although I lost sight of him I heard later that he was admitted to hospital with acute retention. The facts were inconclusive, but I suspect that this was an example of the type of obstruction which I am discussing.

CASE 4.—The patient came with a history of a straightforward enucleation of a moderately enlarged prostate. Resumption of micturition was delayed, and no instrument could be passed. The prostatic bed became heavily infected, and pus poured from the urethra. At operation the internal meatus was found to be completely closed.

CASE 5.—This patient had a history similar to that of case 4 but was my own case. I had been passing a sound regularly, and the closure must have taken place during the third week, when I left a deputy in charge who neglected instrumentation; on my return it was no longer possible. The internal meatus had closed. Originally the vesicoprostatic opening had been large enough to admit of the delivery of a tolerably large prostate.

CASE 6.—A patient with a similar history to that of cases 4 and 5. In my temporary absence instrumentation had been neglected and, when I returned, was only possible with the smallest sound. However, some degree of dilatation was attained and a catheter tied in. As soon as this was removed, the narrowing recurred. The suprapubic wound never healed. In this case the stenosis arose in the prostatic urethra as a fibrous diaphragm stretching across it about a ½ in. below the easily identifiable and uncontracted internal meatus. The gland in the first place had been apparently small and fibrous but microscopically showed "actively growing adenomatous structure with round-celled reaction."

In four of these cases information was available about the technique employed in the prostatectomy. They were all simple enucleations, and no attempt was made at excision of a shelf or reconstruction of the urethral floor In the two of them which I performed the fact that the removal was at a second

stage and the patient's general condition was poor precluded any elaboration

ANATOMY

The musculature at the internal meatus is an elaboration of the vesical musculature into two distinct components One, the sphincter, surrounds the meatus like any other sphincter, but closer study reveals that anteriorly it is considerably attenuated Its action is such as might be expected from a muscle of this type The other component is the trigonal muscle, which is more complicated It is fan shaped and arises from a broad base along the whole length of the bar of Mercier, from which its fibres converge forwards to hook over the posterior segment of the sphincter and thence downwards in the urethral floor to their insertion near the verumontanum, this latter portion is known as the muscle of Bell The antagonism between these two muscles is obvious one closes the orifice, and the other opens it Young and Wesson in 1921 published a remarkably instructive series of pictures illustrating this mechanism The plates depict the internal meatus at rest and in the attempted act of micturition as seen through a direct vision urethroscope It should be remembered that even at rest the meatus is not circular, its margin is somewhat flattened posteriorly In these pictures of attempted micturition one sees this flattening so exaggerated that the outline becomes triangular, at the same time the urethral floor is seen to be depressed and the verumontanum drawn up What is happening is clear The posterior meatal lip is being dragged backwards by the contracting trigonal muscle, and this proceeds until the angulation of the muscle is eliminated The result is a urethral floor which slopes smoothly and uninterruptedly upwards on to the trigonal surface (This is the anatomical ideal to be aimed at after a reconstruction of the internal meatus by endoscopic resection)

The mechanism is considerably disturbed by prostatic enlargement, especially if the prostate projects into the bladder A middle lobe must of necessity stretch the sphincter and displace it backwards by its projection Not only does it displace the sphincter but it displaces the trigonal muscle also—in this case to either side Evidence of the derangement can easily be obtained by examination of an operation specimen The grooving of the sphincter can be seen surrounding the middle lobe, and some of its fibres can be identified clinging to it the grooving of the trigonal muscle can be recognised on either side along the base of its lateral aspects Consequently function is interfered with, and no amount of hypertrophy can compensate

This distortion of the meatal mechanism by the enlarged prostate is widely recognised, whereas the effect of removal of the prostate is largely ignored It is assumed that prostatectomy leaves a permanently gaping orifice, but this is not necessarily so When the gland is removed the sphincter is little disturbed anteriorly and retains its normal attachments, because it is only on the most exceptional occasions that there is an anterior lobe to be undermined The lobes which require enucleation are the lateral and middle, with the result that the muscle is separated from its natural bed all along its lateral and posterior borders Further, the trigonal muscle is completely severed from its insertion into the verumontanum

EXPLANATION OF OBSTRUCTION

We are then left with a sphincter attached anteriorly but free elsewhere, save for its continuity with the vesical musculature, which does not restrain its activities That specialised portion of vesical musculature which is normally its antagonist—i.e., the trigonal muscle—can no longer fulfil its office At the same time the sphincter is still potentially contractile Is it to be wondered at that contraction occasionally takes place, or that, when it does take place, it not only closes the bladder exit but also draws it forwards under the pubic arch?

I believe this to be the explanation of these cases How else can the suddenness and solidity of the occlusion be explained? How else can the fact that the occlusion most commonly occurs at the wider end of the funnel shaped prostatic cavity be accounted for? How otherwise is it possible to interpret the reduction of a vesicoprostatic opening that is two or three finger-breadths wide to the dimple so commonly found at the second operation, or indeed to make intelligible the dimple itself? What other reason can there be for the frequency of posterior "scarring" and the absence of anterior? No one who has even a small experience of this particular complication of prostatectomy can accept the assurance that a wide opening is any particular safeguard To my mind a muscular closure of the bladder neck supplies the most likely explanation of all the phenomena That fibrosis is superimposed on closure detracts nothing from the argument, since circumstances indisputably predispose to it, but that it is the initial change seems to me improbable (There is, of course, the other variety of stenosis, which is a true stenosis and occurs in the prostatic bed, most commonly after the removal of a fibrotic or calculus containing gland)

PROPHYLAXIS

With regard to prevention there is ground for much difference of opinion Obviously, open operation is indicated, whether it takes the form of a Thomson Walker excision of shelf or a Harris reconstruction of urethra The general opinion nowadays seems to favour the latter method, although there are objections to it Some of these are on technical grounds, and I do not propose to deal with them here, others affect the principle of the procedure It is indisputable that an operation of this kind must add greatly to the length of time which the patient spends under the surgeon's hands The delay is inevitable, not only because of the elaboration of technique but also because of the time occupied in obtaining adequate exposure Should the prostatectomy follow a cystotomy this second factor becomes of very great importance, because it is necessary, if the prostatic bed is to be completely exposed, to dissect away all the scar tissue surrounding the suprapubic sinus and to free, to a greater or less extent, a contracted and sometimes fibrotic bladder These considerations must weigh heavily in the balance against open operation when the patient's general condition is not all that might be desired The question arises whether Thomson Walker or Harris methods completely obviate the possibility of contracture Undoubtedly they do not, because cases have been reported of its occurrence after their employment However, the reports are isolated and often lacking in detail, so it would be rash to draw any far reaching conclusions from them

There is another aspect of the matter which claims attention As regards end results, both Thomson-Walker and Harris were most concerned about fibrosis If the real danger is closure of the bladder neck and not fibrosis is there an opportunity for a modification of technique?

One thing is certain, and that is that the indwelling catheter forms an essential part of the after-treatment of prostatectomy, however obnoxious it may be on hygienic grounds. Morson (1930) says that the healing in the prostatic bed is slow and is still incomplete when the suprapubic sinus has closed, even when the urethra has been reconstructed. This seems very probable and should be kept in mind when deciding when to dispense with the catheter. It does not follow that the catheter is still required after micturition has been restored, for micturition serves to maintain patency; but even at this stage the daily passage of a bougie is a wise safeguard. With regard to the insertion of the catheter the following point should be remembered. Its tip, if it is to be of any use at all in preventing contracture (and it is rather doubtful whether it can be, so far as the bladder neck is concerned), must lie within the meatus but not so far within it as to cause ulceration of the opposite bladder wall.

The indwelling catheter is particularly useful when true stenosis is to be feared—i.e., after removal of a fibrous or calculous gland. Occasionally the enucleation of a truly adenomatous enlargement is accompanied by a sagging out of a strip of urethra; if this accident is not noticed at the time, penile bleeding, when the patient gets back to bed, may suggest it. Here again there is danger of stenosis. It is a moot point whether a fibrous gland is ever suitable for prostatectomy if endoscopic resection can be performed.

TREATMENT

The diagnosis of this complication is made on the symptoms and on the difficulty in instrumentation. When, during convalescence from prostatectomy, catheterisation becomes increasingly difficult and micturition is delayed, its presence should be suspected. In these circumstances, especially if the surgeon is unfamiliar with the possibilities of the case, there is a strong temptation to force a passage at all costs, the patient having reached the stage at which his one ambition is to begin passing water in the natural way as soon as ever he can. This is the time for the greatest patience and gentleness, since a little reflection will make it clear that difficulty in instrumentation after prostatectomy is a matter of some gravity.

In the bladder-neck group any attempt at force is likely either to drive the instrument through the trigone or, worse still, to strip up the bladder from its attachments. The dangers of trauma are increased if there is any sepsis to be reckoned with, and the menace of a pelvic cellulitis is always in the background. If a sound can be introduced (this can sometimes be done by keeping its point well forwards), something may be achieved by gradual dilatation. In the early stages of closure the posterior Kollman may have a place in treatment; in the later the resectoscope may be useful. The true fibrotic strictures are more amenable to instrumentation if taken in time, but it should be remembered that the urethra is often distorted into a caricature of its normal course by the scarring.

In many cases it will be found impossible to pass any instrument, and open operation is then inevitable. When the meatus is closed, all the indurated tissue posteriorly is cut away until wide communication is established. It simplifies the procedure if a steel sound is passed through the urethra and its point cut down on from above. Very little bleeding takes place.

When the stenosis is in the prostatic bed the approach is similar, but there are two dangers to be remembered in the excision of tissue. One is the proximity of the rectum posteriorly. The other is the proximity of the compressor urethræ, on which subsequent control depends, inferiorly. The after-treatment is with a retained catheter followed by dilatation.

SUMMARY

(1) There are two varieties of obstruction after prostatectomy: one arising at the internal urinary meatus, and the other in the prostatic bed.

(2) Obstruction at the internal meatus is far commoner than obstruction in the prostatic bed and is due not primarily to fibrosis but to muscular closure of the bladder neck.

ACCIDENTAL TRANSMISSION OF MALARIA

TO A CHILD BY THE INJECTION OF BLOOD

BY DAVID NABARRO, M.D. Lond., F.R.C.P.

DIRECTOR OF THE PATHOLOGICAL DEPARTMENT, THE HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET, LONDON, AND

DERRICK G. ff. EDWARD, M.D. Lond.

ASSISTANT PATHOLOGIST AT THE HOSPITAL

THE risk of using persons who may possibly be suffering from latent malaria as donors for a blood-transfusion is probably not sufficiently recognised. In England there has only been one recorded case of the accidental transmission of malaria to the recipient by blood-transfusion (Thomas, Keys, and Dyke 1936). Recently, however, Wright (1938) collected records of 29 cases in which malaria had been accidentally transmitted by blood-transfusion or by the intramuscular injection of blood. Reports of these accidents have come from several countries, but mostly from those where malaria is not endemic. In malarial countries the risk of transmitting the disease by the injection of blood must be greater, owing to the increased chance of any donor having malaria. It is, however, difficult to prove a definite example because of the impossibility of excluding a natural infection through the agency of a mosquito (Wang and Lee 1936). It is now well known that malarial infection may remain latent for many years in a person even after he has left a malarial country. This latent malaria may be symptomless, and even the initial infection may have gone unrecognised. The risk of using as donors of blood persons who, although they have no symptoms, yet may possibly have acquired malaria while living in a malarial country is thus obvious. The truth of this is borne out by Wright's collected cases, in which less than half the donors had had symptoms of malaria.

This paper records another instance of the transmission of malaria by an intramuscular injection of blood. The recipient, who was an infant, died from the malaria before treatment could be instituted. This is the first occasion on which this complication has proved fatal and it thus emphasises the need for care in the selection of a donor.

CASE-RECORD

The patient was a female infant and was the first child Her ill fortune began at birth, for she was born in a state of blue asphyxia The labour had been normal, and no instruments were used On the first day of her life she had repeated attacks of cyanosis apparently due to subarachnoid hæmorrhage, for the cerebrospinal fluid was under pressure and contained blood The lumbar puncture brought about an improvement in her condition, but on the third day she began to vomit bloodstained material Later she became moderately jaundiced and passed almost black motions She was admitted to the Hospital for Sick Children on the eighth day (Sept 30, 1938) She did not then appear very ill, and her *hæmoglobin percentage* was normal A diagnosis of melæna neonatorum was made, and she was treated by an intramuscular injection into the buttock of 7 c cm of whole blood obtained from her father The infant improved rapidly and, there being no evidence of further bleeding, was discharged on Oct 10, 1938

For the first four weeks after her discharge she progressed normally, but during the three weeks preceding her second admission into hospital there was a history of restlessness, difficulty in feeding, sweating at night, and several small epistaxes There had also been five convulsions, which had taken place at irregular intervals, the last happening on the day before admission

She was readmitted on Dec 6, 1938, then being aged ten weeks Her head was found to be enlarged, *with a circumference of 15 in*, the fontanelle was larger than normal The only other abnormal signs were an easily palpable liver and a spleen that reached the level of the umbilicus She was apyrexial on admission, but in the evening of the second day in hospital her temperature suddenly rose to 102° F On the next day a blood-count gave the following results —

Red cells	2,520 000	Polymorphs	47 5%
White cells	9300	Lymphocytes	35·0%
Hæmoglobin	55%	Monocytes	14·0%
Colour-index	1 1	Eosinophils	Nil
Normoblasts 16	per 100 red cells	Basophils	Nil
Erythroblasts 4 5	" "	Metamyelocytes	1 0%
Megaloblasts 2	" "	Myelocytes	1 5%

There was well-marked anisocytosis, poikilocytosis, and polychromasia, with many Howell Jolly bodies and free nuclear fragments But the blood film yielded much more important information than this There were present also many typical quartan malarial parasites in various stages of development, including a few gametocytes films taken the next day showed the parasites to be present, but in much smaller numbers The infant rapidly became worse, there was respiratory failure, and she died on the 10th in spite of treatment in an oxygen tent and before specific therapy could be started She remained pyrexial to the end

Post mortem examination —The body was that of a female infant weighing 10 lb There was no external abnormality The brain weighed 675 g and appeared normal, there being no evidence of hydrocephalus The heart was normal except for a patent foramen ovale, the ductus arteriosus was not quite closed The lungs appeared normal The liver was a little enlarged and somewhat *bile-stained*, it weighed 230 g The spleen was much enlarged (weight 70 g); it was firm and dark red There was a small splenunculus at the hilum. The kidneys (average weight 72 g) were normal except that the right ureter passed in front of the lower pole of the kidney The ureters, pelvis, and bladder were otherwise normal No abnormality was discovered in the gastro-intestinal tract

Histological examination —The sinuses of the liver were congested, the Kupffer's cells were prominent and contained much dark brown granular pigment Inside the sinuses a few finely pigmented circular bodies were identified as malarial parasites There was a little fine granular pigment in the hepatic cells, which were otherwise normal None of the pigment gave the prussian-blue reaction for iron. Many nucleated red cells were present in the sinuses

The spleen also was congested There had been much hyperplasia of the reticulum cells and other large phagocytic cells, many of them contained granules of brown pigment which did not give the prussian-blue reaction A few malarial parasites could be distinguished, both free and engulfed in phagocytes Many normoblasts and megaloblasts were present in the pulp, being collected in places into small collections of actively erythropoietic tissue

The kidney showed no abnormality apart from acute congestion The heart muscle was normal In the pancreas there was a peculiar area of cellular infiltration, whose nature was not quite certain, but which probably resulted from myeloid metaplasia The brain was normal

FURTHER INVESTIGATIONS

The discovery that the child had malaria necessitated careful inquiry into how she became infected Apart from her time in hospital she had lived in the neighbourhood of West Byfleet, Surrey, and the possibility of infection by a mosquito can be excluded The mother was healthy and had always lived in England On the other hand, the father was born in Ceylon in 1908 and had lived there until 1936, except for six years, 1914–20 After living in Ceylon he went to Gibraltar for three years He has lived in England ever since and thus has been away from Ceylon for twelve years He had been in parts of Ceylon notorious for malaria and had been in the habit of taking quinine prophylactically, but he never to his knowledge acquired the disease His only illness was an attack of fever at the age of sixteen, which was diagnosed as dengue fever Since leaving that country he has been perfectly fit and well and lives an active life as a police constable

Nevertheless, it appeared evident that the infant acquired malaria through the injection of the father's blood, and it has been possible, through the kind coöperation of Dr E L Hutton and Mr P G Shute, of the Horton Hospital, Epsom, to prove that his blood contains quartan parasites A therapeutic injection of 10 c cm of the father's blood was made into a patient with general paralysis of the insane At first nothing happened, and it was thought that the experiment was negative, so the patient was inoculated with *Plasmodium ovale* Soon after he had developed this form of malaria, quartan parasites also began to appear in his blood and later predominated The two types of parasites could be distinguished from each other in the films, and there was thus clear proof that the father still harboured quartan parasites in his blood, although they could not then be directly demonstrated in blood smears Later, however, while under observation, the father had a short attack of fever, and more blood was taken for observation Mr. Shute found a few quartan parasites in thick films although two patients inoculated with the blood did not develop malaria.

COMMENT

The great length of time during which malarial parasites can persist in a person without producing symptoms has been shown on many occasions Such a demonstration is afforded when a patient has a relapse many years after the initial infection without exposure to fresh infection, or when the infection is transmitted to another person with an improperly cleansed syringe or needle or by the injection of blood Walton (1931) mentions a relapse of benign tertian induced by splenectomy in a patient who had

had malaria as a child but had lived symptom-free outside malarial districts for thirty-three years In an example of the transmission of malaria by blood-transfusion, described by Stein (1932), the donor was a native of Greece who had lived in America for sixteen years. He had never to his knowledge suffered from malaria but had had several short periods of ill health Naveiro (1934) describes a case in which the donor had had malaria thirty-seven years previously and since then had been without symptoms

These observations show that every person who has had malaria, although he has remained free of symptoms for many years, must be regarded as a potential carrier of the parasites in his blood. So also must be regarded any person who has lived in an area where malaria is endemic, even if he has never to his knowledge acquired the disease. These facts must be borne in mind whenever the blood of one person is injected into another. It should be a routine procedure to inquire about possible malarial infection or residence in a malarial district before accepting anybody as a donor, and whenever possible such persons should not be used as donors Since this veto excludes all those who have lived in the tropics or in many subtropical countries, it may on occasion be necessary to vary it. Then the recipient should be kept under observation for a period of at least three months, so that the possible onset of malaria should be recognised early and the disease adequately treated

There appears to be some evidence that the risk of transmitting malaria by the injection of blood is greater if the recipient is a child Among the 29 recorded cases in which the age is stated, 15 of the patients infected were children under fourteen This may be due to particularly low resistance to infection in childhood The absence of symptoms in latent malaria must be partly due to increased resistance, but there also appears to be a lowered virulence of the parasites It is noteworthy that the father's blood in our case did not at first produce symptoms in the first patient with general paralysis of the insane into whom it was injected, and that the quartan parasites only began to appear in the patient's blood after he had also been given another type of malaria Also, when subsequently tested when parasites were demonstrable in direct films, there was again apparent failure to transmit malaria to two other adult patients

SUMMARY

An example is recorded of the accidental transmission of quartan malaria to a newborn infant by an intramuscular injection of blood, which proved fatal

It is emphasised that precautions must be taken to avoid this accident whenever the blood of one person is given to another. All those who have ever had malaria, even though they have been symptom-free for many years afterwards, or who have lived in malarial countries must be regarded as potential carriers of the parasites in their blood

It is suggested that infants and children are particularly liable thus to acquire malaria accidentally owing to low resistance In latent malaria the parasites are probably of low virulence and may be unable to infect adults, although young children may be susceptible.

We wish to express our thanks to Dr. E. A. Cockayne for permission to publish the clinical details of this case and to Dr. C. M Wenyon and the staff of the Horton Hospital, Epsom, especially Dr E. L Hutton and Mr. P. G. Shute, who carried out for us the tests and investigations on the blood of the donor.

SURGICAL TREATMENT OF FACIAL PARALYSIS

A REVIEW OF 46 CASES

By W. M. Morris, F R C S E

SURGEON TO THE THROAT, NOSE, AND EAR DEPARTMENT OF THE LONDON HOSPITAL

The purpose of this communication is to give details of the successful treatment of cases of facial paralysis by the three methods devised by Duel, where the lesion causing the paralysis is situated in the fallopian aqueduct—i e, between the geniculate ganglion and the stylomastoid foramen The commonest causes are Bell's palsy and injury of the nerve during mastoidectomy The three methods are. (1) complete or end-to-end graft, where the nerve has been severed and a portion of nerve, taken elsewhere in the body, is used to bridge the gap, (2) inlay or side-by-side graft, used where some fibres of the nerve have been cut across or in other ways interfered with—e g, by scar tissue; and (3) simple exposure of the nerve and decompression by incision of the sheath, as in cases of Bell's palsy

The cases illustrated and described are taken from a series of 46 on which I have operated in the last three years and are typical of the successful results obtained Before describing the selected cases in detail, I wish to record some interesting facts which I have observed during the recovery of the muscle function In the great majority of the cases the muscles supplied by the lower branch of the facial nerve were the first to show signs of recovery. In the very early stage, if the patient were asked to show his teeth, there would be no obvious movement of the mouth on the affected side, but, if asked to try and close his eyes, although unable to do so, in the effort the zygomatic muscles would, quite obviously, draw up the angle of the mouth (fig 1*a*) This is curious, because in those cases in which recovery was practically complete, the eye closed normally, and symmetry was restored, the zygomatic muscles were the muscles which lagged behind This may, perhaps, be explained by the fact that the muscles supplied by the lower division have a much greater excursion than those supplied by the upper division Consequently, the lower-division muscles, when paralysed, are relaxed more than the upper-division muscles But this does not explain why the zygomatic muscles are usually the first to show signs of recovery, unless it be that the action of these muscles is entirely voluntary, whereas the action of some other muscles round the eye is almost involuntary or instinctive as well as voluntary, as in blinking, due to stimulation from the conjunctiva Later on, when recovery has reached a stage in which both upper and lower divisions are obviously working, the patient finds it impossible to dissociate the actions of the muscles, supplied by the two divisions, from each other If asked to show his teeth, the eye partially closes in the effort (fig 8*b*), and if asked

FIG 1—Case 1, six months after operation, some movement of the angle of the mouth on attempting to close the eyes

FIG 2—Case 1, thirty two months after operation, recovery complete, eye can be closed without any accompanying movement of the angle of the mouth (cf fig 1)

to shut his eyes and to frown, the angle of the mouth is raised (fig 1*a*)

These associated movements disappear in time, as recovery becomes complete (figs 5–8) Since the graft or decompression has been carried out in the trunk of the nerve in the aqueduct and re enervation is taking place from that point the fibres of both divisions should be affected equally In consequence, until recovery is complete, impulses travelling down the main trunk affect both divisions equally An infant can register only two emotions with its facial muscles—by laughing or crying—and in doing so it uses together all the muscles supplied by the two divisions When it grows older it can use a group of muscles independently of the others, as in raising one side of the mouth without the other This development of the various groups is carried on until, in adult life, the face can express a great variety of emotions, such as hatred sorrow, anger, affection, pain, or surprise of which a baby's face is incapable Some of us develop this separate movement of groups of muscles to a greater extent than others I can raise my left eyebrow without raising the right or contracting any other muscle of my face, but I cannot raise the right without raising the left Most people can only raise both together Nearly everyone can wink with one or the other eye, but they are unable, voluntarily, to close one eye without partially closing the other I can also move either ear independently at will, but ordinarily this movement is involuntary when I am listening carefully to a minute sound and corresponds to the "cocking" of the ears in a horse or dog All this appears to show that in these upper division muscles there is some involuntary or instinctive movement as well as voluntary Perhaps for this reason the muscles of the upper division show a more obvious and complete recovery earlier than those of the lower division

Treatment of the muscles during recovery should be restricted to manual massage with a view to stimulation of the blood supply Electrical massage causing contraction of the muscles, is contra indicated

FIG 3—Case 2, eight years after mastoidectomy, (*a*) the right eye is not completely closed, and the angle of the mouth is partly raised in the effort to close the eye (*b*) the effort to raise the angle of the mouth partly closes the right eye

FIG 4—Case 2, six months after graft, (*a*) right eye completely closed, without any accompanying movement of the muscles supplied by the lower division of the facial nerve (cf fig 3*a*) (*b*) increased movement of lower-division muscles as compared with fig 3*b*, (*c*) overaction of recovering muscles on the whole side of the face on whistling

FIG 5—Case 3 complete left facial palsy

FIG 6—Case 3, five months after graft

Electrical contraction of a muscle which is being re-enervated will very soon exhaust it Besides manual massage, I make my patient practise movements in front of a mirror for ten minutes two or three times a day, making the muscles of the unaffected side move only as much as the recovering muscles will move. This restores symmetry more quickly, which is the first objective Some patients, more enthusiastic than obedient, spend most of the day doing these exercises, and I constantly find one or other group of muscles in a state of fibrillation Electrical stimulation will produce this condition as well, and that is why I discourage it. The cases illustrated show that the results obtained by this method far exceed those of any of the older methods

FIG. 7—Case 4, complete right facial palsy.

CASE-RECORDS

CASE 1 —Complete or end-to-end graft in a woman, aged 51, with a history of complete mastoidectomy for right middle-ear suppuration of many years' standing by Hunter Tod in 1920. The posterior wound had healed by first intention, and there was no further suppuration until March 8, 1936, when she noticed otorrhœa and sudden onset of right facial palsy. On the 22nd a diagnosis of cholesteatoma and complete right infranuclear facial palsy was made.

At operation on April 6, 1936, the mastoid was reopened. No cholesteatoma was found. The appearance in the meatus was due to desquamated epithelium and meatitis, and the diagnosis was changed to Bell's palsy. I decided to decompress the facial nerve, and in exposing it I accidentally removed with bone forceps a portion of the nerve, 3 mm long, whereupon I identified and isolated the anterior femoral cutaneous nerve in right leg.

On the 30th I transplanted a portion of this nerve, now degenerated, to bridge the gap in the facial nerve.*

No photograph was taken before the operation, but the photographs shown in fig. 1 were taken on Oct. 26, six months after the operation, when it was obvious that there was some movement of the angle of the mouth when the patient attempted to close her eyes (fig. 1*a*). The photographs shown in fig 2 were taken on Dec. 1, 1938, by which time recovery was complete—i.e., thirty-two months after operation.

In later cases I have given up isolating the nerve and allowing the nerve-fibres to degenerate. The graft is transferred at the time of the first operation. This appears to work just as well and makes a second operation unnecessary. It will be noticed, also, that in fig 2*a* recovery is so complete that the eye can be closed without any accompanying movement of the angle of the mouth (cf fig. 1*a*).

CASE 2.—A girl, aged 12, had an acute right mastoiditis in 1930. Incomplete mastoidectomy with injury of the facial nerve caused complete facial paralysis. There was only partial recovery over a period of two years. The photographs shown in fig. 3 were taken on Jan. 15, 1938, eight years after the original operation, and demonstrate the amount of recovery. Fig 3*a* shows that the right eye is not completely closed, and that the angle of the mouth is partially raised in the effort to close the eye. In fig 3*b* the effort to raise the angle of the mouth partially closes the right eye.

Operation on the 25th consisted in decompression of the right facial nerve and inlaid or side-by-side graft. This was decided on because an end-to-end graft would have meant the loss of all recovery which had developed during the eight years since the original operation.

The photographs shown in fig. 4 were taken on July 28, 1938, six months after the graft was inserted. Fig. 4*a* shows the right eye completely closed, without any accompanying movement of the muscles of the lower division (cf. fig. 3*a*). Fig. 4*b* shows the increased movement of the lower-division muscles as compared with fig. 3*b*, and fig. 4*c* the overaction of the recovering muscles of the whole side of the face on whistling, as shown by the raising of the angle of the mouth and the eye being more closed than the left.

CASE 3.—A man, aged 24, with left otorrhœa for many years and sudden onset of left facial palsy on Oct 14, 1937. Photographs taken on Feb 14, 1938, show complete paralysis four months later (fig. 5). Bell's palsy due to infection spreading into the aqueduct from the middle ear or mastoid was diagnosed Operation consisted in simple decompression of the facial nerve, without graft Photographs taken on July 25, 1938, five months later, show the progress made (fig 6)

FIG 8—Case 4, five months after operation: (*a*) shows complete restoration of facial symmetry (cf fig 7) but (*b*) shows an associated action of orbicularis palpebrarum muscles on attempting to bare the teeth

CASE 4 —A man, aged 23, sustained a fracture of his skull in August, 1938, resulting in right facial paralysis without deafness or other intracranial symptoms He was referred to me by Mr. Northfield, who had had him under observation Photographs taken on Oct 17, 1938, three months after the accident, show complete facial paralysis (fig 7).

Radiography showed a linear fracture of the right temporal bone, which could not be followed into the petrous portion. Since, however, the lesion of the facial nerve was the only symptom, I concluded that the fracture involved the aqueduct; and so it proved.

On Oct. 17, 1938, I exposed the nerve but found no evidence of pressure or injury until I exposed the horizontal portion of the aqueduct, where it lies under the external canal of the labyrinth Here I

* This was my first attempt to do this and I wish to acknowledge my indebtedness to Professor Cairns, who helped me with this case, for his advice and encouragement

removed newly deposited bone which was blocking the lumen and pressing on the nerve It came away easily, and I then incised the sheath throughout its course in the aqueduct

Photographs (fig 8) were taken on March 27, just five months later, fig 8a shows that the symmetry of the face has been completely restored (cf fig 7a), but in fig 8b, on attempting to bare the teeth, there is associated action of the orbicularis palpebrarum muscle, hence the right eye is more closed than the unaffected left eye (cf fig 7b)

DISCUSSION

From the appearance of the nerve in cases of Bell's palsy there can be no doubt that congestion, due either to infection or to variation in temperature, is the cause of the paralysis by making the nerve swell in its bony canal The nerve fibres cannot convey impulses owing to the pressure, and paralysis results

In an effort to isolate an organism, Professor Bedson has investigated three cases for me in which there was no evidence of zoster infection in the way of skin eruption or involvement of the geniculate ganglion, and I am indebted to him for the report that there was no evidence of zoster infection in any of them

Four cases in the series have so far, shown no evidence of recovery One, the second in the series was a case of paralysis in a man aged 29, who had had long standing middle ear suppuration and was admitted as an emergency case of lateral sinus thrombosis and facial palsy After radical mastoidectomy, ligation of the internal jugular vein, and evacuation of the thrombus, he developed an osteomyelitis of the temporal bone and lost the outer table over a large area It was after his recovery from this that decompression of the nerve was attempted, and, in considering the case now, I feel that I should have been content with the fact that he was alive and should not have subjected him to further operation Another case was a palsy due to myoclonia This, too occurred early in the series, and the diagnosis of Bell's palsy was at fault The operation should not have been attempted Of the other two, one was a Bell which is unhealed still, nine months after decompression and infection may well be the reason why there is no recovery so far The other was a young woman aged 22, who had had a radical mastoidectomy in which the inner wall of the aditus and antrum was removed as a sequestrum An end to end graft was inserted but I doubt whether I was able to approximate my graft to the proximal end of the facial nerve, which would be about the position of the geniculate ganglion

All the other cases whether end to end side by side grafts, or simple decompressions, have recovered muscle function, some complete, some partial In the cases of partial recovery the patient is always most grateful for the loss of epiphora which seems to be a constant improvement in all of them Cases 3 and 4, in which recovery is complete are late in the series and I think it probable that this is the result of improved technique which is admittedly difficult, since I did my first case three years ago

The cases of Bell's palsy were selected from cases in which there was no evidence of recovery at all two months or more after the onset and the reaction of regeneration was present First evidence of recovery varied from a week to months after the operation In the cases in which partial recovery had taken place and then come to a standstill improvement was invariably slow Recovery in side by side graft took anything from three months to a year to show itself In the end to end grafts no evidence of recovery can be expected before six months, and probably not for a year

PICROTOXIN IN THE TREATMENT OF BARBITURATE POISONING

By J 'L Lovibond, M D Lond, M R C P

ASSISTANT PHYSICIAN, KING GEORGE HOSPITAL, ILFORD, AND MEDICAL REGISTRAR, MIDDLESEX HOSPITAL, LONDON AND

G C Steel, M R C S, D A

ANÆSTHETIC REGISTRAR, MIDDLESEX HOSPITAL

Our interest in the treatment of barbiturate poisoning has been aroused by favourable reports from America on the use of picrotoxin as a physiological antidote An opportunity has recently arisen to enable us to put this method of treatment into practice The results have been so striking that we are encouraged to publish the case

Picrotoxin is a convulsant and appears to act as an intense medullary and cortical stimulant (Edmunds and Gunn 1936) Although it does not directly hasten the destruction of the barbiturate (Kline, Bigg and Whitney 1937) it effectively counteracts the hypnotic effects There is abundant proof that picrotoxin is superior to other possible antidotes in the experimental barbiturate intoxication of animals (Maloney, Fitch and Tatum 1931, Maloney 1933, Arnett 1934, Gower and Van de Erve 1933) but the effect of this drug is not yet widely known in man (Bleckwenn and Masten 1938) Since the first case of barbiturate poisoning treated by picrotoxin was published by Arnett six years ago only 21 have been recorded; of these 17 recovered and in the remainder life was manifestly prolonged

CASE RECORD

A married woman aged 35 was admitted to King George Hospital, Ilford, at 9 P M on May 6, 1939, having probably been in coma since the preceding night She had been found unconscious in bed that morning Although she lived in a doctor's house where supplies of barbiturates were freely available, there was no direct evidence of what preparation she had taken The diagnosis of barbiturate poisoning was made from the clinical appearance of the patient and was afterwards confirmed by the identification of this substance in her cerebrospinal fluid (cobalt nitrate and Millon's tests positive) Persistent albuminuria had been present following nephritis five years previously
